MATERNAL WELFARE SUBCOMMITTEE: D. Frank Kaltreider, MD, *Chairman,* J. Tyler Baker, MD, George H. Davis, MD, Rafael Garcia-Bunuel, MD, John S. Haught, MD, Mervyn L. Carey, MD, Hugh B. McNally, MD, J. King B. E. Seegar, MD, Jonas R. Rappeport, MD, Edwin R. Ruzicka, MD, Herbert L. Yousem, MD.

AD HOC COMMITTEE ON PERINATAL MORTALITY of the Maternal Welfare Subcommittee: J. King B. E. Seegar, MD, *Chairman,* George H. Davis, MD, Rafael Garcia-Bunuel, MD, Richard C. Lang, MD, Joseph J. McDonald, MD, Edwin R. Ruzicka, MD.

MEDIC SUBCOMMITTEE: Frederick J. Heldrich, Jr., MD, *Chairman,* Robert Biern, MD, Edmund G. Beacham, MD, Daniel Bakal, MD, J. Emmett Queen, MD, George J. Weems, MD, George M. Simons, MD, Albert Naham, MD, R. Lane Wroth, MD, Carl J. Houmann, MD, Thomas Crawford, MD, Robert J. Furie, MD, Thaddeus E. Prout, MD, Peter Rodman, MD, Samuel P. Asper, MD, Arthur T. Keefe, Jr., MD, Aubrey Richardson, MD, Irving Freeman, MD, Edward Cotter, MD, Harry Beck, MD, Richard A. Yates, MD, William Schuman, MD, William Morgan, MD, Frederick Johnson, MD, Edwin J. Jensen, MD, James D. Carr, MD, Albert P. Marsh, MD, Leon Sheer, MD, John Tuohy, MD, Robert E. May, MD, William C. Mulford, MD, Pietro U. Capurro, MD, Wilson Grubb, MD, Donald Roop, MD, Charles Spencer, MD, David Marine, MD.

SUBCOMMITTEE ON THE MEDICAL ASPECTS OF SPORTS: John B. De Hoff, MD, *Chairman,* James W. Banks, MD, Robert G. Brewer, MD, Alvin Brown, MD, William C. Duffy, MD, Charles M. Henderson, MD, G. Overton Himmelwright, MD, John M. Krager, MD, Edmond J. McDonnell, MD, Andrew C. Mitchell, MD, Ross Z. Pierpont, MD, Marcus Stephanides, MD, Ramsay B. Thomas, MD, Leonard Wallenstein, MD.

SPEAKERS BUREAU SUBCOMMITTEE: Joseph B. Workman, MD, *Chairman.*

SYMPOSIUM SUBCOMMITTEE: John Whitridge, Jr., MD, *Chairman,* John B. De Hoff, MD, Frederick J. Heldrich, Jr., MD, John H. Hirschfeld, MD.

TRAFFIC SAFETY SUBCOMMITTEE: Ruth Workman Baldwin, MD, *Chairman,* Timothy D. Baker, MD, Solomon E. Barr, MD, Rudiger Breitenecker, MD, George Cohen, MD, John E. Gessner, MD, Irene L. Hitchman, MD, Paul V. Joliet, MD, Howard F. Kinnamon, MD, Robert R. R. Roberts, MD, Perry Stearns, MD, Robert J. Wilder, MD.

COMMITTEE ON PROGRAM AND ARRANGEMENTS

Mr. President and Members of the House of Delegates:

In 1968 another successful Annual Meeting of the Medical and Chirurgical Faculty was held at the Alcazar, April 17, 18, 19. This was the 170th Annual Meeting of the Faculty, and was arranged under the chairmanship of Thaddeus E. Prout, MD. The registration, 1,310, was just slightly lower than the previous year which was an all-time high. It was felt the Caribbean Cruise Convention immediately following the sessions at the Alcazar may have curtailed attendance by some physicians. The scientific program was very well received, and the report of the Medical Exhibitors Association was excellent from the exhibitors' viewpoint. The Health Evaluation Tests were again given with 453 persons taking the tests. Many physicians and their families participated in the Caribbean Cruise Convention. There were two scientific sessions, plus medical films shown daily aboard ship. These were attended by practically every physician on the cruise.

The site of the 1968 Semiannual Meeting was again the Diplomat Motor Hotel in Ocean City, Maryland. This was held September 5, 6, 7, with the highest registration (581) of any Semiannual Meeting of the Faculty. The several specialty societies which held scientific programs in conjunction with the Faculty's meeting had splendid attendance. Both the banquet, at which Roy O. Scholz, MD, spoke on "Medico's First Decade," and the crab feast luncheon were well attended with a maximum number of reservations received. However, there were many complaints regarding the facilities of the Diplomat and the cooperating motels. A decision has now been made, with Council approval, to hold the 1969 Semiannual Meeting at the Hotel Hershey, in Hershey, Pennsylvania. The facilities there will be quite adequate with many meeting rooms and many forms of entertainment for both the physicians and their wives.

The plans for the 1969 Annual Meeting are complete at this time with a varied program of interest to all physicians. The grand rounds which proved quite popular in 1968 have again been scheduled, with the University of Maryland School of Medicine presenting medical grand rounds and The Johns Hopkins University School of Medicine presenting surgical grand rounds. One session will be devoted to a coronary care panel, another to diagnostic and treatment procedures applicable for general practice. There will also be several endowed lectureships presented by prominent physicians.

The Dean of The Johns Hopkins University School of Medicine sometime ago sent an invitation to the Faculty to hold all or part of the 1969 Annual Meeting in the school's new facilities in conjunction with its 75th anniversary. In the summer of 1968 an inspection of the new buildings was made and, in addition to not being assured the buildings would be completed, it was found there would not be sufficient space available for the number of exhibits usually displayed at the Annual Meeting. However, on Saturday, April 12, the members of the Faculty have been invited to attend medical and pediatric grand rounds in the new Turner Auditorium, to be followed by a tour of the many new treatment and research centers at Hopkins. It is hoped many of our members will take advantage of this opportunity.

The change in the format of the annual luncheon in 1968 did not prove as successful as anticipated. The type of Round Table Luncheon, which has been held for many years has been planned again for this year, but with a fewer number of tables. This reduction in the number of tables has been made in order to have better attendance at the ones planned and to avoid sound interference between tables by having them placed farther apart. The annual Presidential Reception and Banquet will be held with the Chairman of the Board of Trustees of the American Medical Association giving a short talk, which will be followed by dancing. An innovation at this Annual Meeting will be a Hospitality Night on Wednesday evening to which all members of the Faculty and their wives are invited, as well as the representa-

tives of exhibiting companies. This will replace the usual cocktail party given for the exhibitors.

Once again the Health Evaluation Tests, which have proven most worthwhile and have brought to light several previously unknown abnormal conditions among the physicians, will be held. As of this writing, there are not quite the usual number of technical exhibit booths reserved but, according to a study which has been made by the Pharmaceutical Manufacturers Association, this is the trend throughout the country. In comparison, our Society has suffered less of a reduction than other state societies and it is felt the income from the exhibits will be only slightly below that of 1968. Scientific exhibits by members of the Faculty and physicians from nearby states have been accepted to the full capacity of the exhibit hall.

Our committee takes this opportunity to express its sincere appreciation to the members of the Faculty through whose cooperation and efforts the success of these meetings has been made possible. Special thanks are extended to the members of the Subcommittee on Health Evaluation Tests who have worked so diligently in providing this worthwhile opportunity for all members of the Faculty; and to the members of the Faculty staff who also have given so untiringly of their time to the numerous details involved in the Annual and Semiannual Meetings.

Respectfully submitted,
Joseph D. B. King, MD, *Chairman*
DeWitt E. DeLawter, MD
Arlie R. Mansberger, Jr., MD
John B. De Hoff, MD
Ernest B. Nuttall, DDS

PUBLIC RELATIONS COMMITTEE

Mr. President and Members of the House of Delegates:

The committee has held two meetings during the past year, at which considerable business has been transacted.

A Public Speaking Seminar was held on March 13, 1969 in the Faculty Building. This has become an annual program, but this year it was conducted by the American Medical Association rather than Smith, Kline and French Laboratories.

A Medical Assistants' Seminar was held in May, 1968 with great success. Plans are being made for another such program in 1969.

The assistance of the Woman's Auxiliary has been requested in two areas; in establishing lists of foreign-speaking hospital staff members, or community citizens who would help out in a situation involving a foreign-speaking patient, or perhaps deaf-and-dumb patients; and in organizing an Annual Nurses Recognition Day. These programs will probably be implemented on the county level.

A program of Citizen Service Awards has been initiated through component societies, whereby community citizens who have contributed to the general health of the community, or given outstanding service to the medical profession, will be recognized by the presentation of a certificate. Guidelines for selection of nominees have been issued to component societies.

Component societies have been requested to initiate School Health Coordinating Councils, to work closely with local Departments of Education and Health and PTAs. The School Health Council works on the state level with the Departments of Education, Health, and Mental Hygiene, and coordination at the "grass roots" level is desired.

After first rejecting support of the Health Manpower Resources Program, the committee heard a request by Health Council for reconsideration. Opinion was reversed, after learning more details of the program, and the Executive Committee was requested to give its approval. This was given. No financial support is being requested at this time.

Request from Radio Station WFBR for approval of the broadcast, "Doctor's House Call" to be sponsored by a chain pharmacy, was denied.

Respectfully submitted,
Richard A. Young, MD, *Chairman*
Manning W. Alden, MD
Earl M. Beardsley, MD
Jean O. Feys, MD
James M. Hitzrot, II, MD
Robert B. Goldstein, MD
Clayton Norton, MD
George Sharpe, MD
E. Roderick Shipley, MD
Bernard Gordon, DDS
Mrs. Martin Strobel

UNIVERSITY OF MARYLAND CHAPTER, STUDENT AMERICAN MEDICAL ASSOCIATION

Mr. President and members of the House of Delegates:

SAMA entered a new era of leadership on the medical campus this year by being stimulated by the hormones of competition. SAMA attempted to expand the broad base of activity which it already possessed. The words, concern, commitment, and action we hope characterize our ideas and endeavors on the Maryland campus.

Just as it was necessary for SAMA to provide a broad range of services to its members, it was also mandatory that SAMA serve the community. The first aspect which we have continued to do for several years has been high school visitations. Several of our first schools visited were primarily in the counties; Calvert County, Montgomery County, and the area high schools in Baltimore city. The people we speak to each year seem to become more aware of the medical community and the medical profession, and the questions that are asked are more challenging than they have been in the past.

When I was first making visitations, it seemed that they were asking how to get into medical school, and what you should take in college. Today, the questions seem to be on heart transplants, immunology, and the various aspects of the highly complicated technical fields. We attempted at one time to establish a closer liaison with the Medical-Chirurgical Faculty so that we might be able to take a physician along with the student, to answer the more difficult and complex questions. It has been in the planning, and unfortunately, it wasn't successful this year. Possibly, in the future, we may be able to get the program to the point where a physician could go with us and speak and represent both the Medical-Chirurgical Faculty and the University of Maryland.

The second major function is Career Day which will be held May 10. Anyone interested is more than welcome to come. We will provide a free lunch and you will have an opportunity to meet high school and college students from our area and the surrounding states. Each year we have invited mainly high school students. We've broadened it this year to include college students, and college and high school counselors. It seems there is a break in communications between what our admissions committee tells the students and what the high school and high school guidance counselors and the deans of the various colleges communicate to the students. We feel we might be able to bridge this gap if we are able to bring them to the university, show them the university, and speak with them informally at lunchtime. Dr. Young, we hope, will also be there from the Medical-Chirurgical Public Relations Committee.

More on a service and educational level has been our movie program which has been sponsored by Upjohn. Upjohn has put together approximately 50 movies on various aspects, ranging from stroke, to cardiovascular surgery, to complex discussions on hypnosis, and the delivery of a baby by cesarean section. These movies have been well attended, primarily by freshman and sophomores. They've been running since the beginning of January and will continue to run 'til the end of the year. There are about 150 medical students that either eat their lunches to cesarean sections or use free time to watch the very interesting movies.

Our speaker program has been more successful than in the past due to an increase in funds allotted to us from another organization and several drug houses. We were able to get Dr. Hillard Jason from University of Michigan, Dean of Medical Education (Medical Education is the hottest thing on our university campus and most other university campuses around the country). Dr. Jason was kind enough and gracious enough to meet with several students and faculty members of the university for informal discussion.

We were able to discuss topics ranging from student participation to his feelings on how curriculum should be run. It was a pleasant interchange and an enlightening one. Dr. Jason then spoke before the rest of the students on his feelings on medical education—what we hope to get out of medical education in the future.

This year it seems that more medical students desire to go abroad for summer electives, or to take the program that the University of Maryland is offering, and spend this time either in another university in the United States or over in Europe. SAMA, as a service to its members, decided to run a foreign fellowship program in which students from the previous senior class are called upon to speak about their experiences in Europe and the United States. It was enlightening in that it was a student approach to how to get around the faculty's requirements, so to speak, or how to graciously convince the dean to let you out of some specialty in surgery, and let you go take your medicine elective, or vice versa.

SAMA is concerned about its members, their feelings, and their wishes, and yet we are committed to present programs which would also broaden our education. Last year at our presentation here, we spoke about community health, since that was of more current interest than medical education. This year, I believe it's medical education, but we've also been criticized as being one year behind so we got into both programs and our educational program is what we call the emergency room medical advocate program. It seems that one of the main criticisms in major university schools that are in the inner city, is the poor way, or the inequitable way, that patients are treated in the emergency rooms. The cry of the freshman and sophomore medical student is that it's a herd that is placed against the wall and one by one they're seen by so-called physicians, junior students, or senior students and are never seen by a doctor.

We thought that it would be educational for freshman and sophomore medical students to spend some time in the emergency room. We thought it would be good for the students to establish a rapport with the community. In this medical advocate program, or health care delivery system, freshman and sophomore students on weekends, of their own accord and without any reimbursement or any threats or any grades attached to their service, are seated in the emergency room, and welcome and greet the patients as they come in. They don't take a history and they don't perform a physical examination. Their sole function is to talk to the patient when he comes in. It turns out that they are doing what seems to be a psychiatric clerkship in that they're speaking with the patient about his problems concerning his illness, and why he waited until 11:30 at night to come to the emergency room.

The goal of this pilot program is to have it incorporated into the community medicine program that is being developed by the university. The fellows that have worked in the emergency room have gained a tremendous amount of experience in interviewing or speaking with patients and have overcome some of the fright that some of my class members in the junior year had when they first walked on the wards and had to take histories and do physicals. The students are not restricted to the outer waiting room and are encouraged by the house officers, who are more than willing to speak to them and teach them, to traverse the green door and see the patients as they're being treated.

The second program we've initiated is student participation in the medical curriculum changes. Spurred on by some of Dr. Jason's suggestions, and previous suggestions by our own classmates, we presented to the curriculum committee a suggestion that some students be placed on the committee. I'm pleased to say that this year the committee decided to choose two students who will sit on the school's curriculum committee. In addition to this, one of the staff members of the university, Dr. David Simpson, is the President of Eastern Thoracic Association, and a curriculum committee will be created to discuss courses in pulmonary and respiratory medicine. They have decided to work through SAMA chapters, and to choose members who will meet at Saranac Lake in the middle of June to discuss curriculum changes in regard to pulmonary medicine.

This is a huge step forward in student participation in the medical curriculums. There have been different discussions as to whether a freshman or sophomore student is capable of deciding whether he should take an elective in urology or he should continue in medicine. I don't believe that he will be called upon to make de-

cisions, but his representation and his ideas, I think, will be more thoroughly considered.

Our two largest publications are the *New Physician* and the "Asclepian." The *New Physician,* which students, residents and some sustaining members receive, has taken on new dimensions in publication. Previously, it was a poor imitation of the *New England Journal of Medicine.* As it stands today, there's no relation, or very little relation to a medical journal, and no relation whatsoever to the *New England Journal.* There are more culturally related articles, several topical articles on drug abuse and addiction, and it's turned into a rather interesting publication for medical students. The "Asclepian," which is our school newspaper, is published under the auspices of SAMA. It's not restricted. Any member can write into the paper, and we request and solicit articles from staff and faculty members.

I was fortunate enough to be a member of one of the public relations committee meetings here and had a chance to participate in an informal interchange with the members of that committee. I was pleased to see that the committee is intimately aware of several of the problems in the schools and is concerned with increasing help to these schools.

Med-chi has made one gracious contribution and I thank you again for your support. I hope that through more careful interchange we might be able to establish a physician and student relationship in high school interviews, and that possibly you might be able to come down to our meetings more often than in the past.

With your continued aid and guidance, I'm sure SAMA will act to see that the interest of its members in the medical profession and community are fulfilled.

Respectfully submitted,
DAVID TAPPER, *President*

THE WOMAN'S AUXILIARY TO THE MEDICAL AND CHIRURGICAL FACULTY OF MARYLAND

Mr. President and Members of the House of Delegates:

Your Woman's Auxiliary appreciates the privilege of reporting to you on this year's accomplishments and aspirations.

In addition to continuing our many on-going programs, we initiated and pursued an amazing number of new projects, with Faculty approval.

An Ad Hoc Committee on Children and Youth was established, with emphasis on stemming the tides of violence engulfing our youth via mass media. We joined forces with other community organizations and medical auxiliaries nationally, for an impact that already has begun bearing fruit. A letter-writing campaign directed at leading radio, television, and movie producers, as well as newspaper editors and feature writers, was instigated. Joint conferences and forums were held with school, religious and other community leaders, students, columnists and interested groups. The culmination, to date, has been the keynote speech on this topic at our annual meeting, followed by an exciting panel of knowledgeable experts in this field. (We were gratified, too, to have many national, regional and out-of-state guests accept our invitation to attend this annual meeting.) Steps have also been taken toward the appointment of some Maryland Auxilians to the President's White House Conference on Children and Youth in 1970, hopefully.

For the first time, we conducted at the state level all six workshops paralleling those at the national level, in an attempt to bring back to our counties some of the wealth of information, fresh ideas, and enthusiasm imparted to us. For the first time, too, Maryland had 100% participation at the Regional Workshops in Boston covering American Medical Association-Education Research Foundation fund-raising techniques, Community Health needs for home aid services, Disaster Preparedness-Safety programs, imaginative recruiting projects for Health Careers, interdependent Program and Membership planning, and the vast area of creative Mental Health approaches.

We are now publishing a new brochure descriptively listing national's ten outstanding researched package programs on urgent areas of health concern. These are available under our auspices for use by communities according to their needs. Our national periodical, "M.D.'s Wife", has taken note of our phenomenal success, with such package programs on Health Careers and Mental Health, already presented before twenty-six interested county groups numbering well over a thousand people per package this year. Our "Block Mother Program", to safeguard young children en route to and from school, is being put to good use locally, and we are confident that our other excellent programs on Drug Abuse, Tobacco, Alcohol, Teen-Age Venereal Disease Control, Safe Babysitter Training and Homemaker Health Services will be equally well employed when better known. Another program, on Sex Education, is being widely used with excellent results, in cooperation with our county schools. A new centralized library of these programs is now housed at Med-Chi for prior inspection and project selection.

We conducted a state-wide survey of home-centered health care services available to shut-ins, the elderly, and families in danger of disintegration for temporary lack of a homemaker. This pointed up the glaring lack of centralized information, as well as area gaps in meals services, friendly visitors, and home aides.

In conjunction with our chosen theme for the year, "As Others See Us", we circulated a questionnaire inquiring into our members' involvement in other community activities. Although limited, the response impressively confirmed that doctors' wives are indeed the active and concerned ambassadors of their busy husbands in community service.

At the requests of your Public Relations Committee, we suggested a means of your honoring nurses, and we have launched an effort to enlist "Translation Team" volunteers in hospital communities. These lay or professional people would be called upon to help alleviate communication problems which sometimes arise with foreign patients, particularly outside urban areas, and might well be an additional important mental health factor in their recovery. Anyone willing to act as such an interpreter should list his name with us; we'd welcome your help.

Our auxilians have acted as hostesses for the medical society in many new, as well as continuing, programs at both local and state levels. We have manned your coffee booths and exhibits; immunology, testing, and detection centers; medical seminars, luncheons, library tables, and such. We were also pleased to provide a list of our widows, as requested, for inclusion in your Med-Chi Membership Directory.

We co-sponsored a superior new color film, "The Many Hats of Laurie and Harriet," produced by the Health Department, for nurse recruiting, and we were proud of its selection for showing at the national auxiliary meetings in July at the Waldorf-Astoria in New York. (We are also planning to have a "Show and Tell Exhibit" on Tuesday of those meetings and would welcome your attendance.)

Our Handbook and Bylaws were revised, of necessity, and a resolution submitted to confer honorary membership on a second deserving auxilian.

For a real "change of pace," we tried a new American Medical Association-Education Research Foundation Fun(d)-Day approach—a highly successful "Day at the Races" at Laurel last fall, supplemented by "Mini-Shares for ERF" this spring. (To augment our AMA-ERF coffers, our component auxiliaries staged numerous successful theater and card parties, fashion show-luncheons, sold Christmas and special occasion cards, note paper, and the "Doctor's Wife" rose bushes. Cecil County came up with a new fund-raising venture—needlecraft lessons! By all these means, we look forward to another record year when the final tally for ERF is made. These funds (almost $6,000) were applied this year toward our two medical schools' needs and the AMA Biomedical Research Institute.

Our programs have been unusual and timely. Our Semiannual Meeting speaker, Dr. Eareckson, was so well received that a spontaneous contribution was collected for his "Bethany House" project for wayward boys in need of a wholesome home atmosphere. Following an outstanding feature article in our excellent newsletter, "Hygeia Filiae" (which emphasized the medical image of community service in keeping with our chosen theme for the year), this venture attracted national notice and a further feature write-up by the Sunpapers.

We are also very happy about five fledgeling component newsletters this year, all serving a fine function in communication. (Other means of coordination and communication included the state president's visits to the counties as well as neighboring states, regional and national meetings; each component county's representation on the State Auxiliary Board which met regularly; and, of course, our state publications.) We circulated copies of our Governor's Proclamation of Doctors' Day to all the component auxiliaries and submitted it for publication on the auxiliary's page in the State Medical Journal for the first time.

So much for what has been different this year. Our pill-packing parties for overseas shipments have continued, but these are about to be "phased out" because of high shipping costs, supervision problems, and some customs restrictions. Our other International Health activities will continue unabated, with johnny coats, leper bandages, books, soap and clothing being shipped; international medical personnel and guests entertained.

Among our many other activities, Baltimore County auxilians visited the House of Delegates in Annapolis with appropriate acknowledgement of their attendance arranged, while the City conducted a telephone survey of the doctors for the Community Chest-Red Cross United Appeal, as requested. Washington Countians were delighted with their showcase of medical memorabilia set up for the Doctors' Library at their County Hospital.

Another of our counties (Harford) is preparing slides with commentaries on the many varied health career opportunities within its borders. Our Future Nurses and Health Careers Club activities continue to expand in the almost 60 high school clubs throughout the state which we help guide and finance. Our scholarships to students in health careers have more than doubled in the past year. Baltimore city alone has awarded about $22,000 to medical and paramedical students since 1956, with about one fourth of this given during the past year, interest-free. Prince Georges is having a "Psychedelic Costume Party" to raise more funds for its scholarships.

Allegany members are active on many councils and programs (the latest involves adoptions) for which they have earned the community's respect. Wicomico County, too, has taken an important leadership role in community education and medical hospitality, as it attempts to decrease the medical manpower shortage in that area. Carroll County's Bedside Library is now nicely under way. A number of our women are on the advisory committees for nursing programs at county community colleges, in county community action programs, on Mental Health and Social Service Boards. Many county auxiliaries have given strong volunteer and financial support to sheltered workshops for the handicapped, the Mental Health Society, psychiatric institutions, local hospitals, a sanitorium, libraries, day care and rehabilitation centers.

Our Disaster Preparedness—Safety Committee has done its share toward making this a "Safe not Sorry" year through support of numerous fire, clean-up, traffic safety and poison-prevention community projects.

We had 100% participation of all our components in the observance of Doctors' Day, I am pleased to report. The means employed were varied: dinner-dances, cocktail-buffets, bouquets of carnations and patient-tray favors in hospitals, AMA-ERF contributions, radio and television spots in some counties, a Central Pratt Library window display, a hospital luncheon with auxiliary members as hostesses, contributions of books, health periodicals, posters and completion of "The History of Medicine in Wicomico County."

In hopes of preparing both husband and wife for future practice and productive medical society participation, we have sponsored and worked closely with the Woman's Auxiliary to the Student AMA (WASAMA), whose president also reported on their fine year at our meeting yesterday.

Our hospitality has been ample, our archives up to date, our finances in order, and we have enjoyed excellent public relations and coverage from the press.

It would be splendid if more of our components could emulate the sizeable increase in membership (26) ef-

fected by Montgomery County this year. Our current membership approximates 940 in our 11 organized auxiliaries covering 13 counties and Baltimore City, with "members-at-large" from ten other unorganized counties. We are working hard at "making membership more meaningful" and believe that we have taken giant steps again this year. It is our hope that our image, "As Others See Us," has grown more lovely during the year and that more doctors and their wives will be eager to swell our ranks. Here again we need your help to fulfill our tremendous potential.

We are grateful for your continued generous assistance and encouragement; we are hopeful, too, that we have been a real Helping Hand in the Big Picture of Progress for both our organizations, which share the same goals.

Respectfully submitted,
MRS. H. LEONARD WARRES, *President*

TREASURER'S REPORT

COMMENTS ON 1969 PROPOSED BUDGET—MEDICAL AND CHIRURGICAL FACULTY OF MARYLAND

A. *CONTRIBUTIONS:* Student American Medical Association:

National Chapter	$100.00
University of Maryland Chapter	250.00
National Society for Medical Research	50.00
Miscellaneous	300.00
	$700.00

B. *PROPERTY MAINTENANCE:* The increasing costs of repairs and maintenance of the Faculty property accounts for the $500. increase in this item.

C. *SALARIES:* A general revision in Salary Ranges took place during 1968. The Faculty, as is all organizations and individuals, is faced with increasing costs of hiring personnel. In addition, one more secretary position was authorized in 1968, of which only a portion of the year's salary in the Actual 1968 figures is included. Normal increments for 1969 are also included.

D. *SOCIAL SECURITY:* An increase of $1,300 is included due to an increase in the Faculty's portion of Social Security contributions.

E. *TRAVEL:* Authorizations and attendance at the following meetings:

Professional Convention Management Association and Medical Exhibitors Association, Atlanta, Georgia, January 5-7, One Staff Member

National Congress on Socioeconomics of Health Care, Chicago, Ill., March 28, 29, 1969, One Staff Member

National Medicolegal Meeting, Las Vegas, Nev., March 14, 15, 1969; One Staff Member

Medical Society Executives Association (1 day) and American Medical Association Annual Meeting (5 days), New York City, July, 1969—One Staff Member, Three Delegates and Senior Alternate Delegate

Medical Society Executives Association (1 day) and AMA Institute (2 days), Chicago, Ill.—Two Staff Members

American Medical Association Clinical Meeting, Denver, Colorado (4 days), November/December, 1969—One Staff Member, Three Delegates and Senior Alternate Delegate

Maryland participation in Southeastern States Hospitality Room at AMA Annual and Clinical Sessions

Attendance of Committee and Subcommittee Chairmen; as well as Faculty designees at meetings sponsored by AMA and other associated organizations. These are authorized on an individual basis by the Executive Committee

Travel (mileage) throughout State for staff persons in visits to component societies and other Faculty business

Library: International Congress on Medical Libraries, Amsterdam, The Netherlands, June, 1969

Special Library Association, Montreal, Canada, June, 1969

Medical Library Association, Louisville, Ky.

Regional Library Meetings, Bethesda, Md.

Any TRAVEL for which the Faculty is reimbursed by the AMA or other affiliated, allied or associated groups is approved without reference to the Executive Committee.

F. *LEGISLATIVE:*

Operation of First Aid Room	$1,000.00
Legislative Newsletter (5-6 issues)	3,000.00
Copies of Legislative bills	300.00
Legislative Expenses (mileage, meals, etc.)	500.00
Legislative activity on federal level	200.00
	$5,000.00

G. *LIBRARY EXPENSES:*

Total, per library budget	$32,500.00	
Less items included in other budget headings (salaries, social security, etc.)	27,500.00	$5,000.00

Journal subscriptions, books, binding, etc., are paid for from designated fund income and are, therefore, not included in these figures.

Respectfully submitted,
KARL F. MECH, MD, *Treasurer*

The Auditor's Report will appear in a future issue of the JOURNAL.

Reports of the following Committees will be formally presented at the Semiannual Session, September 1969. Preparation of these reports in sufficient time for printing and distribution prior to the Annual Session was not possible because of the unusually early date for the Annual Session, as well as the State General Assembly being in session until late March.

American Red Cross Blood Research Program
Board of Medical Examiners
Legislative Committee
Liaison Committee
Mediation Committee
Medical Economics Committee
Medicolegal Committee
Occupational Health Committee
Professional Medical Services Committee

These reports appear on the following pages.

BOARD OF MEDICAL EXAMINERS OF MARYLAND

Report for the year ending December 31, 1968

Mr. Chairman and Members of the House of Delegates:

The Board of Medical Examiners is composed of the following members whose terms expire on the dates indicated:

John J. Curry, MD 1969
Vernon H. Norwood, MD 1969
Elmer G. Linhardt, MD 1970
William L. Stewart, MD 1970
J. Roy Guyther, MD 1971
Gerald A. Galvin, MD 1971
Karl F. Mech, MD 1972
Archie R. Cohen, MD 1972

As the terms of John J. Curry, MD, and Vernon H. Norwood, MD, expire June 1969, two members to serve until 1973 are to be elected at the meeting of the Medical and Chirurgical Faculty.

J. Roy Guyther, MD, was appointed to fill the vacancy created by the resignation of John H. Hornbaker, MD, whose term would have expired in 1971. Dr. Guyther, or someone else, is to be elected to fill the vacancy created by Dr. Hornbaker's resignation.

Examinations given during the year show the following results:

Applications received for examination		592
Second-year students examined and re-examined	56	
Postponed, withdrawn or did not appear	101	
Failed to complete	1	
Not eligible for license		158
Examined in second part of examination	81	
Complete examination		245
Re-examined		108
Eligible for license		434
Passed–American Graduates	135	287
Passed–Foreign Graduates	152	
Failed–American Graduates	25	147
Failed–Foreign Graduates	122	

American Graduates who failed are as follows:

Johns Hopkins–1; Howard–19; Georgetown–1; U. of Maryland–1; Meharry–1; Phil. Osteopathic School–1; Puerto Rico–1.

Licenses issued after examination	287
Licenses issued by endorsement of other State's Licenses	248
Licenses issued by endorsement of National Board Certificate	325
Total Licenses issued	860
Licenses revoked	1
Licenses suspended	0
Licentiates certified to other states	351
Copies of Licenses issued	16
American graduates examined and re-examined	314
Foreign graduates examined and re-examined	237
Foreign graduates approved for examination	264
Written inquiries from foreign graduates (approximately)	750
Office interviews with foreign graduates (approximately)	375
Telephone inquiries from foreign graduates (approximately)	1700
Telephone inquiries concerning registration of physicians	1500
Registration certificates issued from 1/1/68 to 12/31/68	933

Licensed by Special Examination

Richard Rowe, MD—1/29/68
Charles C. Berdjis, MD—2/16/68
Martin Andrew Nelson, MD—4/19/68
Fayek G. Yassa, MD—4/19/68
Virender K. Saini, MD—5/17/68
John Harold Painter, MD—6/21/68
Peter C. Luchsinger, MD—12/20/68
Mieczyslaw Mirowski, MD—12/20/68

Revocation of Medical License

The medical license of *Ghulam M. Nasim,* was revoked on June 4, 1968 for obtaining licensure by fraudulent, deceptive and erroneous means. The case has been appealed.

Probation

Elizabeth Reese Wilkens, MD, was placed on probation with instructions to appear quarterly at Executive Committee meetings for a term to correspond with the court probation, after being convicted for selling "pep pills." Dr. Wilkens notified the Board on October 22, 1968, that she was retiring from the practice of medicine.

Reprimanded

Luis Cuza, MD, has been requested to appear before the Executive Committee quarterly to give an account of his professional activities. This action was taken after receiving complaints that he was indiscriminately selling dangerous drugs.

Carlos Arrabal, MD, appeared before the Executive Committee on January 19, 1968 and October 18, 1968, and gave satisfactory reports of his professional activities.

William Howard Philpott, MD—The Board notified Dr. Philpott that it considered the evidence given it, and it is felt he probably transgressed the Medical Practice Act for advertising.

Stuart A. Perkal, MD, and James F. McCarter, MD—A letter dated May 6, 1968 from Wolcott L. Etienne, MD, chairman of the Mediation Committee of the Medical and Chirurgical Faculty, to one, Stuart A. Perkal, MD, was read in which it was stated that on September 28, 1967, the Faculty's Mediation Committee had deliberated on the matter of his participation in

the alleged abortion by James F. McCarter, MD, of Cambridge, Maryland. The Secretary was empowered to make a resumé on the action of Stuart A. Perkal, MD, and James F. McCarter, MD, and attach such resumé to their permanent records. This resumé is to include the Mediation Committee's censure.

Unlicensed physicians—No unlicensed physician should be practicing medicine in the State of Maryland other than as an intern or resident in an approved training program.

John Gordon Rennie, MD—The Board was notified by the Federation of State Medical Boards that the medical license of Dr. Rennie was revoked in the State of California, execution of order of revocation stayed and respondent placed on probation for five years, and that he was convicted of violations of the statutes of the State of California regulating narcotics. The Board unanimously voted to proceed with the necessary administrative procedures to hold a hearing for the consideration of suspension or revocation of his license to practice medicine in the State of Maryland.

George Beck, MD—The Board unanimously voted to proceed with the necessary administrative procedures to hold a hearing for consideration of suspension or revocation of his license to practice medicine in the State of Maryland. Dr. Beck was licensed by this Board on July 16, 1953.

William Eisner, MD, has been requested to appear before the Executive Committee with regard to his current medical practice, and the use of unlicensed physicians in his office. Dr. Eisner was licensed by this Board on May 13, 1942.

Alfred R. Lapin, MD—Pine View Nursing Home—Dr. Lapin was reprimanded for using unlicensed physicians in the Pine View Nursing Home, and advised that any further participation in this type of activity would result in consideration of suspension or revocation of his Maryland medical license.

S. A. Bowman—Violation of the Medical Practice Act. This has been referred to the State's Attorney for Wicomico County for action.

Ballentine & Shub Laboratories—It was the decision of the Executive Committee that the Ballentine & Shub Laboratories were in violation of the Medical Practice Act. They were notified to cease and desist such practices in the future.

Applications for restoration of license

Webster Sewell, MD, requested permission to take the State Board examination for licensure. The Board granted him permission to take the regular written examination on or after June, 1968.

Grayson Spencer Waldrop, MD, requested the Board to reinstate his Maryland medical license. This request was denied.

Sixty-Fourth Annual Congress of Medical Education and Licensure

Doctors Vernon H. Norwood, Walter C. Merkel and William L. Stewart attended the Congress held in Chicago, Illinois, February 9-14, 1968. Member Boards voted to revise the dues structure and this Board was billed $300.

Cuban Refugee Physicians

It was the decision of the Board that Cuban (refugees) physicians be treated no differently than any other foreign graduate in that they be required to complete two years of hospital training in the United States in either internship or residency programs, with one of these years being spent in Maryland or one of our borderline states before being eligible for licensure in Maryland (along with other requirements). This became effective July 1, 1968.

Medical Ethics

Each applicant for examination is now supplied with a copy of "Principles of Medical Ethics" with a notation to the effect that questions on its contents may be given on the examination.

Court Registration

The Board was informed that the court registration fee for medical licenses was increased from $2 to $5, effective July 1, 1968.

Change in Reciprocity procedure

The Executive Committee may accept an applicant for reciprocity even if one or more grades are below 75%, only with states having reciprocity with Maryland and the National Board candidates. Applicants from states with no reciprocity with Maryland must meet not only the general average of 75%, but grades in each of the subjects must be 75% or above.

Rules of Procedure for Board Hearings

Rules of Procedure for Board Hearings were established in accordance with the Administrative Procedure Act of Maryland under Article 41, Sections 245, 246, and 251 of the Annotated Code of Maryland (1967 Cumulative Supplement).

Tuberculin Testing Screening Center

It was the decision of the Board that under the jurisdiction of the Tuberculosis Association, a registered nurse may administer the test. The interpretation of the test by a nurse is in violation of the Medical Practice Act.

Paramedical Licensure

John M. Dennis, MD, a member of the Medical and Chirurgical Faculty, met with the Board to give them information on proposed legislation for paramedical licensure in Maryland of Radiologic Technologists. The Board is interested and concerned with this legislation, and at the moment, it is in the interest of the welfare of the general public. Dr. Dennis will keep the Board informed of the progress made and will present any legislation for consideration prior to its submission to the legislature.

Increase in Reciprocity Fees

The fee for licensure by reciprocity or endorsement was increased from $50 to $100, effective January 1, 1969.

Triennial Registration

It was the decision of the Board that the triennial registration of physicians be performed by one third of the total registrants being registered each year.

Respectfully submitted,

ELMER G. LINHARDT, MD, *Executive Secretary*

LEGISLATIVE COMMITTEE

Mr. President and Members of the House of Delegates:

There were over 100 bills of considerable importance to the profession introduced into the General Assembly at the 1969 session. Members of the Legislature are becoming more and more cognizant of the role of the Medical and Chirurgical Faculty in this area. Appreciation is expressed to all those members of the Faculty who gave of their time and knowledge to go to Annapolis to represent the Faculty.

The Assemblyman, issued at intervals during the session, carried details of bills of interest to physicians. A listing of the primary bills affecting medicine is appended to this report.

A request was made by this committee and approved by the Executive Committee that Faculty members refrain from appearing at committee hearings in Annapolis as representing the Faculty, unless they have been designated to do so. This, of course, does not limit the individual's right to present his own, personal views.

The First Aid Room in the State House was again maintained for the convenience of members of the Legislature during the 70-day session. As in past years, this service was sponsored by the Anne Arundel County Medical Society, the Anne Arundel General Hospital, and the Faculty. However, this year, a new service was added. Members of the Maryland Academy of General Practice gave a day of their time, to be available to members of the Legislature, visitors, and staff who might need care, and at the same time, to become more familiar with legislative processes. Senate Resolution 88 was adopted which expressed appreciation to the physicians of Maryland for this service.

A legislative subcommittee was initiated to study the Licensure of Paramedical Personnel. Several meetings were held, after which a bill was submitted to the Legislature which would license radiologic technologists. This was referred to the Legislative Council (the between-session arm of the General Assembly) for further study. It was decided that an attempt to license medical technologists would be postponed, at least until the next (1970) session.

A legislative subcommittee to consider physician-patient privileged communication legislation met once to discuss a proposal by a legislator that such a bill be introduced. It was agreed to table this matter until such time as more persuasive evidence with regard to the need for such legislation could be presented.

Another subcommittee was formed to discuss implied warranty legislation. There was one meeting of this group and the result was that a bill prepared by the Faculty's legal counsel was presented for introduction in the General Assembly. After committee hearings, it was felt that the bill should not be amended and a request was made that the committee kill it.

Another special legislative committee to discuss a proposal for a Board of Dispensing Opticians met with representatives of the Optician, Optometrist, and Ophthalmologist organizations. A draft of legislation to license dispensing opticians was presented and revised several times. However, because of many difficulties and differences of opinion, the bill was never presented to the Legislature.

Because of the passage of the Anatomical Gift Act legislation in 1968, and impending amendments in the 1969 session of the General Assembly, a Medical Tissue Donation Committee was formed. This committee met several times for the purpose of planning the coordination and centralization of files and registry of all types of organs or human tissue so that maximum utilization of available tissue may be made. Forms have been designed for the public to use in requesting donation of organs either pre- or post-mortem. However, in view of the permissive language of the Anatomical Gift Act, one of the forms may be revised. It is anticipated that the master form will be kept at the headquarters of METIC (Medical Transplant Information Center) and a plasticized, wallet-sized card will be issued to the donor to carry with him. Telephone directory listings were prepared by members of the committee.

Several component societies held dinner meetings with their local representatives in the Legislature. These dinner meetings have proven very successful and more such personal contact is urged.

One meeting of the Legislative Committee was held with physicians of five counties attending via the MEDIC network. This innovation met with enthusiasm and will be continued in the future. Each component society was requested to name a liaison member with this committee in order that information can be transmitted to each society quickly, and this, too, will be continued as a policy of the committee.

Respectfully submitted,

B. MARTIN MIDDLETON, MD, *Chairman*
STEPHEN K. PADUSSIS, MD
J. MORRIS REESE, MD
ROLAND T. SMOOT, MD
FRANCIS J. TOWNSEND, MD
WILLIAM A. WILLIAMS, MD

APPENDIX

Senate Bill 149, after amendments by both Senate and House, was enacted into law in the final days of the Legislative Session. Effective on July 1, 1969, individuals may incorporate and take advantage of tax situations that heretofore were not available to professional persons.

The Faculty has under consideration a proposal to assist in any legal actions that may have to be taken to obtain a District Court ruling that the above is permissible under IRS regulations. Court rulings already in existence are not necessarily applicable to the District in which Maryland is located.

A bill to *define blood as a service* and not a product *(Senate Bill 75)* met with opposition in the Senate Economic Affairs Committee. This was a pre-filed bill and the U.S. Supreme Court ruling on this subject had not been received at the time it was pre-filed. Before committee action was taken, the Faculty requested that the bill not be amended and that it be killed in committee. This was done.

House Bill 240 established the principal that the Board of Education, in cooperation with the Board of Health, promulgate Rules and Regulations regarding required immunizations of school children in order for them to enter school. This was enacted by the Senate in the closing hours of the session.

House Bill 346, the Generic Prescribing Bill, with minor amendments, was adopted by the House and Senate. A communication in this regard will be sent to all members at a later date. The bill requires the pharmacist to fill Medicaid prescriptions with a generic equivalent from the State Department of Health formulary, unless the physician indicates otherwise.

House Bill 385 gives authority to the State Board of Health and Mental Hygiene (now the Secretary of Health and Mental Hygiene—see below) to contract with nonprofit insurance carriers to provide health services to Medicaid recipients.

House Bill 512 requires the State Health Department to initiate a system of Peer Review in the Medicaid program. It also abolished the old "Council on Medical Care" whose duties are now being performed by the Medical Assistance Advisory Committee.

House Bills 850 and 851 were both enacted into law. They provide for *Express Consent and Implied Consent.* This legislation was part of the Governor's package in connection with traffic safety.

The Drug Abuse Control Act was also enacted into law at this session of the Legislature. It provides for establishment of an *Advisory Council on Drug Abuse,* as well as a Drug Abuse Authority. The Authority would have broad powers to, "promote, develop, establish, coordinate and conduct unified programs for education, prevention, diagnosis, treatment, after-care, community referral, rehabilitation and control in the field of drug abuse."

Senate Bill 404 provides for *creation of the post of Secretary of Health and Mental Hygiene,* at the same time abolishing the Board of Health and Mental Hygiene. The bill gives broad powers to the Secretary to reorganize the Departments of Health and Mental Hygiene.

The various medical and medically-related licensure boards are also placed within this new department, as are agencies such as, The Anatomy Board of Maryland, and the Board of Post-Mortem Examiners.

Senate Bill 512, patterned very much after the Commission on Medical Discipline, established a *Commission on Optometry Discipline.* It is our understanding that the dental groups have under consideration a similar commission for dental discipline.

Senate Bill 557 makes it unlawful for any company to mail unsolicited drugs to "resident," "occupant," or to named persons whose names are obtained from lists. An exemption was placed into the law for those individuals "who are licensed to disburse, prescribe, or administer such drugs."

Senate Bill 768 was also enacted into law, and provides for certain amendments to Maryland's Anatomical Gift Act, adopted at the 1968 General Assembly session.

Senate Bill 769 was enacted into law which requires that tissue banks and blood banks be licensed and be under the direction of a licensed physician.

More mail was generated to the members of the General Assembly on *House Bill 683* than any other single bill considered this year. This bill would have prohibited the use of Chloramphenicol except under certain circumstances; and would have also established penalties if physicians used this drug. In addition, the bill provided that if a patient developed any side effects from the use of the drug, that it would, *post ipso facto,* be considered malpractice and a civil award would be assessed as well.

This bill was given an unfavorable report by the committee and, therefore, failed to pass. There is no question that the flood of mail by physicians did much to convince the committee members of the ridiculous provisions of this bill.

LIAISON COMMITTEE

Mr. President and Members of the House of Delegates:

The entire Liaison Committee held only one main meeting during the 1968/69 year. The various subcommittees, however, reflect most of the activity of the committee and their reports follow.

Subcommittee on Medicine and Religion:

This subcommittee held several meetings, all attended by a representative of the AMA's Department of Medicine and Religion. A Theological Seminary Education Program was discussed in great detail, and it is the hope of the subcommittee that such a program can be implemented during the next Faculty year. There are four seminaries in Maryland, and it is anticipated that the component society where each seminary is located will work with the seminary in these programs.

The Memorial Hospital in Cumberland, held its annual Medicine and Religion Day in October 1968.

Because of the importance to the profession and the community, it is felt that the subcommittee should become a full committee of the Faculty. An appropriate bylaw amendment was adopted at the April 8, 1969, meeting of the House of Delegates.

A request has been made to the AMA for a new film, *A Storm-A Strife,* available on a long-term loan basis for use in Maryland.

It is hoped that the new committee will establish a Medicine and Religion Month to be promoted throughout the state.

A Workshop on Medicine and Religion is planned for next year. Each component society wll be asked to send a representative who will also act as a local liaison person for the committee.

Subcommittee on Pharmacy:

This subcommittee held only one meeting during the

year. It reported to the Mediation Committee information dealing with a physician permitting an unauthorized person in his office to dispense medication. The subcommittee also recommended to the Mediation Committee that direct telephone lines between physicians and pharmacists be declared unethical. This recommendation was adopted by the Mediation Committee and the Council.

Still under discussion within the subcommittee is an educational program directed at both the public and physicians in connection with drug abuse.

Nursing Liaison Subcommittee:

This group met on two occasions during the year. It approved an amendment to the Nurses Protocol dealing with nursing care in Intensive Care and Coronary Care Units of hospitals. This amendment was approved by the governing bodies of both the Faculty and the Maryland Nurses Association. Discussion continues in connection with the regulations and utilization of allied health personnel.

The *Nursing Home Liaison Subcommittee* held no meetings during the year.

Respectfully submitted,

DONALD W. MINTZER, MD, *Chairman*
MELVIN N. BORDEN, MD
ROBERT E. FARBER, MD
PAUL F. GUERIN, MD
JOHN H. HIRSCHFELD, MD
JOHN KEHOE, MD
HARRY W. DRESSEL, MD
WILLIAM J. PEEPLES, MD
JOHN F. SCHAFFER, MD
WILLIAM L. STEWART, MD
H. LEONARD, WARRES, MD
W. KENNETH MANSFIELD, MD
LEON R. LEVITSKY, MD

MEDIATION COMMITTEE

Mr. President and Members of the House of Delegates:

The Mediation Committee met monthly during the year concluded. A complete numerical listing of all cases coming before the committee, as well as before Component Society Grievance Committees, is appended at the conclusion of this report.

As in previous years, the committee was called upon to consider serious complaints against physicians. In addition, numerous queries regarding specific ethical problems were discussed and conclusions provided to the inquirer.

A Subcommittee on Narcotic Prescribing Practices was appointed to look into possible abuses of narcotic prescribing by certain physicians. Nine physicians were invited to meet with the subcommittee, and representatives of the U.S. Department of Narcotics and Dangerous Drugs were also invited to attend. As a result of these meetings, Ethical Guidelines were prepared for distribution to all physicians, in an attempt to curb the improper or indiscriminate treatment of addicts in offices of private physicians. The matter is still under study and final recommendations have not been made.

The *Maryland State Medical Journal* now carries a column in selected issues devoted to a particular ethical problem. A booklet is being prepared which will outline ethical rulings and policies of the Faculty, and which will be distributed to all members. In addition, a pamphlet describing the Commission on Medical Discipline, and explaining it in considerable detail, has been published and will be distributed to members.

As a result of publicity concerning weight control practices by certain physicians in Maryland, the Attorney General held a two-day public hearing on this subject. Members of the public, as well as certain physicians, other representatives of the health field, and AMA were invited to appear at these hearings. As a result, certain recommendations were made. One recommendation was in the field of physician education, and this is being carried out through the efforts of Faculty committees.

A Subcommittee of the Mediation Committee and Blue Shield was formed, at the request of Blue Shield, for the purpose of establishing liaison between Blue Shield and the Faculty with regard to various phases of utilization review. The committee held two meetings, the first, to establish guidelines for committee activities, and the second, to consider possible over-utilization and charging practices of one particular physician.

A Subcommittee to Study the Effect of Maryland's Abortion Law was also formed when reports were received that Maryland was becoming an "abortion mill". Questionnaires were distributed to all hospitals in the state, requesting information as to the number of abortions performed, and the reasons for them. To date, the returns have not been analyzed, but the committee remains active.

Guidelines for the handling of grievance cases were approved and distributed to all component societies. These were developed because of the increasing misunderstandings and difficulties involved in the proper and adequate handling of complaints filed by the public against physicians.

The Mediation Committee was charged with the responsibility of making determinations in variations from the standard telephone listings in the yellow pages of the telephone directories throughout the state. The Council adopted specific policies in this respect in 1967, and delegated to this committee the responsibility for determining what variations should be permitted in this area. The committee has approved certain minor variations for physicians in several counties throughout the state, all with component society approval or consent.

The Board of Medical Examiners has agreed, after suggestions from this committee, to prepare questions dealing with ethics on which physicians taking the licensure examination will be quizzed. Each time an application for the licensure examination is distributed, a copy of the Principles of Medical Ethics of the AMA will also be handed the examinee. We hope this is a step toward the education of the new physician in ethical matters. All too often, such individuals follow practices of other physicians who may be misinformed, and frequently they accept advice from finan-

cial or business management groups which are not familiar with medical ethics.

On the recommendation of the Mediation Committee, the Faculty's Council adopted the principle that direct telephone lines between a physician and a pharmacist are unethical. The Maryland Pharmaceutical Association has adopted the same ruling.

During the year, the Mediation Committee recommended that the membership of a physician be suspended because of an unethical act which the committee felt warranted such strong action. The Executive Committee concurred in this recommendation of the Mediation Committee, and took appropriate action.

The committee has noticed an increase in the number of problems coming before it. Many of these involve hospital emergency room cases and, in some instances, based upon the information before it, the committee feels these cases are handled very poorly by the hospitals concerned. It may be that some persons would wonder why physicians should be concerned over the poor policies in handling complaints that some hospitals seem to practice. Unfortunately, the public is of the opinion that physicians are responsible for hospital operations and, consequently, place the blame for inept handling of complaints at the physicians' door. The committee is still discussing this problem and, hopefully, can make some recommendations to appropriate parties in this regard.

MEDICAL ADVISORY COMMITTEE OF THE AMERICAN RED CROSS BLOOD BANK PROGRAM

Mr. President and Members of the House of Delegates:

During the fiscal year of 1967-68, the American Red Cross collected 3,008,400 units of blood—an increase of 29,300 over last year's collection.

Whole blood was distributed to 4,300 hospitals in 48 states, the District of Columbia, Puerto Rico and the Virgin Islands. Two thousand five hundred of these hospitals received their total supply of blood from the American Red Cross.

In addition to whole blood, the following blood products were distributed:

Serum Albumin	**89,400 units (100 ml 25%)**
Gamma Globulin	**653,200 units (1 ml)**
Fibrinogen	**4,400 units (2 g)**
Vaccinia Immune Globulin	**1,900 units (5 ml)**
Packed Red Cells	**147,700 units (275 ml)**
Fresh Frozen Plasma	**59,500 units (225 ml)**
Platelet Rich Plasma	**1,400 units (225 ml)**
Platelet Concentrate	**20,500 units (25 ml)**
Cryoprecipitate	**21,100 units (20 ml)**
Antihemophilic Factor Concentrate	**2,600 vials**

The gross cost of all blood services by the national organization and chapters throughout the states was $34,509,100.

MEDICAL ECONOMICS COMMITTEE

Mr. President and Members of the House of Delegates:

This committee held four meetings during the year. One meeting was devoted to an in-depth discussion of the Professional Liability Insurance program offered the members by the St. Paul Companies. The Company provided the committee with extensive information on premium income, expenses, as well as payment of claims and those amounts held in reserve for possible future claim payment. Unfortunately, it was necessary to recommend certain adjustments in the premiums offered to our members and such a suggestion was made to the Council. The Council approved this recommendation and the changes went into effect with all policy renewals and new policies written after approximately February 1, 1969.

During the past year, the committee provided malpractice panels to discuss common causes of malpractice action, to the various hospital staffs throughout the state. A total of five presentations were made. It was also brought to the attention of the St. Paul Company that the Faculty's panel considerations in pending malpractice actions were available to Maryland physicians in the Washington, D.C., area. It has been learned that many of the physicians in this area, as well as the St. Paul Company agents, were not aware of the existence of this Faculty service.

The other meetings were devoted to an examination of fees charged under Major Medical Insurance programs offered through insurance carriers. A total of fifteen cases was considered by the committee. Adjustments downward were made, insofar as the Usual, Customary, and Reasonable fee for similar procedures in the same community is concerned, in eight cases. The other cases, totalling seven, were determined to be within the range of Usual, Customary, and Reasonable fees. It is emphasized that no action is taken to determine an individual physician's fee. Rather, the committee in its response to the carriers, emphasizes that the physician has the right to charge what he determines his skill, time and effort are worth and that this is a valid contract between the physician and the patient. It is felt, however, that this service provided to carriers helps considerably in presenting the image of peer review so important today.

MEDICOLEGAL COMMITTEE

Mr. President and Members of the House of Delegates:

The committee held one meeting this year, but the three subcommittees met more frequently.

The Subcommittee on Interprofessional Relations has had four meetings, at which differences between physicians and attorneys have been settled. Most of these differences have centered around fees for expert witness testimony or deposition. There are differences of opinion as to what constitutes an "expert opinion" and whether fee for such testimony can be advanced by the attorney. It was agreed, finally, that fee for expert witness testimony, either in person or by deposition, is a legitimate item of expense which can be advanced by the attorney, but is reimbursable by the client. It is the duty of the attorney to see that the physician is paid his fee, although the attorney may not pay the fee from his own resources. It was also agreed that it is up to the attorney to discuss with the physician, at the time he requests his testimony, details of payment of such fee.

An amendment to the Medicolegal Code of Cooperation was approved by the committee, and considered by the Maryland State Bar Association at its midwinter meeting. However, some questions were raised by the Board of Governors and approval has been withheld pending further study.

An authorization and assignment form letter was designed which would give authorization to the physician to forward a medical report to the attorney representing his patient, and assignment of payment for professional services from proceeds of recovery. This will be submitted to the full committee for approval, and dissemination to physicians and attorneys.

Three cases were referred to the Grievance Committee of the Bar Association for consideration be-

cause of failure of attorneys to respond to correspondence from this committee.

The Symposium Subcommittee has done an excellent job this year, presenting two symposia. One was presented by physicians for attorneys at their mid-winter meeting, and the other by attorneys for physicians at the Faculty's Annual Meeting. The second symposium was a continuing dialogue on the subject of the Legal Effect of Malpractice Suits on the Practice of Medicine. Attendance at both symposia was excellent and the presentations were exceedingly well done. A full-page article was carried in the AMA NEWS regarding the first symposium.

The Subcommittee on Court Procedures met once, to reconsider the matter of a medicolegal screening panel, to evaluate malpractice actions against physicians and decide on their merit. This concept was rejected by the 1968 committee, but the new committee was asked to re-evaluate the problem. No new conclusions could be reached, but additional information was requested from California where an "arbitration" type program is being tried.

A representative of the Faculty attended the National Medicolegal Symposium in Las Vegas, Nevada, March 13-15, 1969.

OCCUPATIONAL HEALTH COMMITTEE

Mr. President and Members of the House of Delegates:

The Occupational Health Committee held one meeting this year. This was a dinner meeting to which each member brought one or two guests who are interested in occupational or industrial health. The guest speaker was Lomax Wells, MD, immediate past-chairman of AMA's Committee on Occupational Health. He spoke on federal legislation, and general matters pertaining to this health field.

Because of correspondence from a physician, the issue of Hong Kong flu immunizations being given at certain industrial plants was raised. Since it is believed that these were administered according to guidelines set by the Surgeon General, no action was taken.

Again, the issue of State Health Department laboratories being used for private patients was discussed. The medical director of the Maryland National Bank was contacted for information regarding the bank's

policy, but as of this writing, no reply has been received.

State legislation concerning occupational health was reviewed. Two bills, favored by this committee, were enacted by the Legislature. Two others, considered unfavorable, were killed in committee.

The committee was reminded that a candidate must be selected early for the Governor's Award to a Physician for Employment of the Handicapped.

Respectfully submitted,

PROFESSIONAL MEDICAL SERVICES COMMITTEE

Mr. President and Members of the House of Delegates:

During the past year, considerable time has been devoted to a discussion of whether the *Fee Guide,* published in 1966, should be updated, or whether the committee should continue to take the position that the concept of Usual, Customary, and Reasonable fees should prevail. Inasmuch as the House of Delegates has adopted this latter position, no formal action has been taken by the committee. It will, in all probability, continue to discuss this concept and, if necessary, make appropriate recommendations in this regard.

Liaison has continued with the State Health Department, through the Special Liaison Committee to Meet With State Health Department Representatives. This committee was disbanded in January 1969, and its functions assumed by the Faculty's Executive Committee. In this area, close contact was maintained with the State Health Department in preparation of its 1970 fiscal year budget requests.

The committee also received status reports with respect to replacement of the present Workmen's Compensation Commission Fee Guide with the concept of Usual, Customary, and Reasonable fees. The House of Delegates adopted Resolution 1S/68 dealing with this subject at its Annual Meeting, April 11, 1969, thus closing out this aspect of the committee's activity at this time.

During the year, the Executive Secretary was requested to prepare a report dealing with the delivery of health care services. This was completed, and An Analyses of Health Care Services in Maryland was presented to the committee for consideration at its January 29, 1969, meeting. A general discussion ensued regarding the various methods available for delivery of health care services to disadvantaged persons, particularly in the urban areas of Maryland. No conclusions in this regard were reached.

In December 1968, the committee was asked to meet with Maryland Medical Service (Blue Shield) to discuss a proposal to have that organization assume the responsibility for the state's Medicaid program. Since that time, the Council has assumed direction of any discussions with state officials in this regard. The committee has gone on record as being in favor of the proposal for a Multiphasic Screening Program being studied by a special ad hoc committee formed for this purpose.

REFERENCE COMMITTEE

Mr. President and Members of the House of Delegates:

The Reference Committee met on Thursday, March 20, 1969, to discuss the various resolutions before it. Each Faculty member was notified of the hearing by a postal card mailed to them on March 5, 1969. In addition, all Delegates, Alternate Delegates, Officers of Component Societies and others were sent copies of the resolutions under date of March 3, 1969.

Resolution 1 S/68

Submitted on: July 5, 1969

Introduced by: Marion Friedman, MD, and 31 other members of the Baltimore City Medical Society

Subject: Workmen's Compensation Cases being charged on the basis of "Usual, Customary and Reasonable Fees"; and suggesting a course of action in this regard.

Whereas, The United States Government through its various health programs such as Medicare (Title 18), the Federal Employees Health Insurance Program, and U.S. Armed Forces Dependents Medical Care

Program, as well as many others, is based on the concept of payment to the physician of his Usual and Customary Fee; and

Whereas, The United Steel Workers of America has negotiated contracts with their employers that provide for provision of health insurance making payment to physicians on the basis of their Usual and Customary Fees; and

Whereas, The House of Delegates of the Medical and Chirurgical Faculty of the State of Maryland on September 9, 1966, adopted a resolution in which the "resolved" portion reads as follows:

Resolved, That the House of Delegates of the Medical and Chirurgical Faculty of the State of Maryland go on record as urging its members to submit bills for payment of "usual, customary and reasonable fees" for professional services rendered Workmen's Compensation Cases, as well as other Governmental agencies; and

Whereas, The present provisions of the Workmen's Compensation Law, Article 101, Section 37 (c) reads as follows:

> "All fees and other charges for such treatment and services shall be subject to regulation by the Commission, and shall be *limited to such charges as prevail in the same community for similar treatment of injured persons of a like standard of living,"* and

(emphasis ours)

Whereas, The Workmen's Compensation Commission has authorized hospitals providing services to persons covered under the Workmen's Compensation Laws of this State to bill at their "posted charges," without having to request a hearing and without obtaining permission for any such increases in charges; and

Whereas, Under present regulations of the Workmen's Compensation Commission the individual physician is forced to request arbitration of fees by the Commission when Insurance Carriers elect not to pay the physician's Usual and Customary fees, but abide rigidly to the Fee *Guide* published by the Workmen's Compensation Commission; and

Whereas, Within the Medical and Chirurgical Faculty's organization are reliable mechanisms through which questionable fees charged by physicians may be adjudicated; and

Whereas, At least ten other states already work under the concept of Usual, Customary and Reasonable fees for physicians' services in their handling of Workmen's Compensation cases; and

Whereas, There is no reason why Workmen's Compensation Recipients should be treated differently from other patients of physicians; and

Whereas, This disparity in treatment by Insurance Carriers and the Commission could lead to substandard medical treatment of Workmen's Compensation Cases; now therefore, be it

Deletion Recommended

Resolved, That Physicians in Maryland be urged to advise all insurance carriers that they intend to charge their Usual, Customary and Reasonable fees for Workmen's Compensation cases seen by them; and be it further

Resolved, That Insurance Carriers who continue to arbitrarily reduce fees paid to physicians for such Workmen's Compensation cases be taken to court so that a test case can be made to determine if they are in violation of the law as it is presently written; and be it further

Resolved, That physicians who elect not to see such Workmen's Compensation Cases because of this arbitrary attitude on the part of the groups involved so notify the Insurance Carriers, requesting them to seek the services of other physicians for care of such patients.

Since the September, 1968, Semiannual Meeting, an informal meeting was held with the entire membership of the Workmen's Compensation Commission. Following that meeting, a communication, dated January 22, 1969, was received from the Commission which reads, in part, as follows:

> "You are hereby advised that the Commission has rejected the request of the Faculty for a fee schedule based on the usual, customary and reasonable fees. Under the law, as soon as a fee schedule has been revised (on which some work is now being done), it will be published as required and a hearing scheduled."

The Faculty's House of Delegates has repeatedly stated that it supports the concept of payment of Usual, Customary and Reasonable Fees for all payments made by third parties. If a fee schedule is adopted by the Workmen's Compensation Commission it is the responsibility of each physician to determine for himself if the schedule falls within his *personal Usual, Customary and Reasonable fee.* If he wishes to continue to treat Workmen's Compensation cases, he can do so with that understanding.

If physicians, individually or collectively, wish to submit a guide to the Workmen's Compensation Commission as their usual and customary fees, this would not be in conflict with Faculty policy.

There are, doubtless, many others whose fees will probably be higher or lower than the schedule the Commission may finally adopt. If this is the case, the Resolveds of Resolution 1S/68 can come into operation.

In adopting this resolution, it is understood that the Faculty takes the position that the wording contained in the current Annotated Code of Maryland and cited in the Resolution as being Article 101, Section 37 (c), provides for payment of Usual, Customary and Reasonable Fees. It is also understood that the Faculty will instigate the court case to determine if the Commission is, indeed, in violation of the law.

In this light, the Reference Committee recommends to the House of Delegates that Resolution 1S/68 be amended by striking out the last paragraph of the preamble and that, as amended, the Resolution be adopted.

Resolution 1A/69

Submitted on: September 19, 1968

Introduced by: Prince Georges Medical Association

Subject: Formation of a Committee to Formulate Model Group Hospital and Medical Insurance Master Policies; and Make its Services Available to Interested Persons; and Urge the AMA to Establish a Similar Committee

Whereas, We as physicians have noted a tremendous increase in the number and type of the various group health insurance programs; and

Whereas, We believe these programs, if properly handled, can be of great benefit to both employers and employees, as well as the general public; and

Whereas, There is a current tendency on the part of some insurance companies to reduce policy benefits in order to sell substandard policies at lower prices to employers who are not aware of the facts and who lack the requisite expertise to compare and evaluate competing plans; and

Whereas, Physicians through their national, state and county medical societies are in a unique position to advise and counsel with employers, employees, insurance companies and the general public in health insurance matters; now, therefore, be it

Resolved, That the Medical and Chirurgical Faculty of the State of Maryland* establish a committee whose purpose it shall be to formulate model group hospital and medical insurance master policies for use by employees, employers, insurance companies and members of the general public in this State; and

Resolved, That said committee shall thereafter furnish consultation services to interested persons, firms or groups with respect to such insurance programs so that each party to such transactions can be made fully aware of the essential elements of proposed insurance plans in order that they may intelligently evaluate and compare the same; and

Resolved, That the Medical and Chirurgical Faculty of the State of Maryland urge the American Medical Association to establish a similar committee for the same purpose on a national basis.

NOTE: See Art. XI, Section 3 (Economics Committee) and Section 16 (Occupational Health) for possible crossing of lines of interest.

** The word "standing" has been stricken since the bylaws would require amendment to create such a committee and if "standing" is insisted on, the resolution is not in order.*

This resolution provides for a committee of the Faculty to become knowledgeable and give advice in connection with "model group hospital and medical insurance master policies." This is a problem with which the American Medical Association has been struggling for some years. The AMA has determined recently that it is impossible to define minimum standards applicable to all. The AMA has, however, attacked the problem by providing factual information for those who wish it, in connection with what buyers of health care insurance should look for and be aware of. This factual data, it is anticipated, will be forthcoming shortly and be available to all those who wish to have such information. Your Reference Committee believes this resolution to have considerable merit and recommends that the final Resolved be stricken, inasmuch as its intent has already been accomplished on a national level, and that Resolution 1A/69 be adopted, as amended.

Resolution 2A/69

Submitted on: February 13, 1969

Introduced by: William G. Esmond, MD, and 37 other members of the Baltimore City Medical Society

Subject: Authentication of house staff examinations by attending or operating physicians prior to major medical or surgical procedures being performed

Whereas, The Joint Commission on Accreditation of Hospitals specifies that:

". . . the Joint Commission on Accreditation of Hospitals reaffirms its conviction that history-taking and physical examination of a patient admitted to a hospital are a part of the practice of medicine; their unsupervised performance and unreviewed recording by medical students are not conducive to the best quality of medical care, are not a useful learning experience, and may place the extern, the attending physician, and the hosiptal in legal jeopardy. They cannot therefore be considered acceptable practices in an accredited hospital, as either an economic resource for students or a time-saving device for physicians."

and,

Whereas, It is obvious from such a statement that any patient who is scheduled for surgical procedures or who is in need of a medical regime that requires the skills of a licensed physician should have such history and physical examination authenticated by the attending physician or a qualified individual (by that is meant a licensed physician); and,

Whereas, It has become known that this is not always the practice that is being followed in some hospitals that utilize the services of externs; and

Whereas, Such practices cannot be condoned under any circumstances; be it, therefore,

Resolved, That the Medical and Chirurgical Faculty

of the State of Maryland, in the interest of better patient care, requires that BEFORE SURGICAL PROCEDURES ARE PERFORMED AND BEFORE MEDICAL REGIMES OR TREATMENT ARE ESTABLISHED, that histories and physicals performed by externs or house staff, be properly authenticated and approved by a legally licensed physician.

The Joint Commission on Accreditation of Hospitals has already established appropriate criteria pertinent to this problem. It is believed that implementation and/or modification of the JCAH criteria lies in the province of the Medical Staff of individual hospitals, rather than the Medical and Chirurgical Faculty.

In light of certain emergency situations which could arise, attempts by the Faculty to specify which house officers should countersign physical examinations, and when, could interfere with or delay prompt and adequate care of patients.

Your Reference Committee recommends, therefore, that Resolution 2A/69 NOT be adopted.

Resolution 3A/69

Submitted on: February 14, 1969

Introduced by: Washington County Medical Society

Subject: Directing that Local Component Medical Societies Establish Policies on a Local Level for Yellow Page Telephone Directory Listings.

Whereas, The American Medical Association has sent guidelines to the Medical and Chirurgical Faculty dealing with telephone listings of physicians; which included a statement that control should be at the local society level; and

Whereas, The Medical and Chirurgical Faculty Council (11-16-67) has taken action to enforce its own interpretations of these guidelines without placing control at the local society level; and

Whereas, The enforced terminology "practice limited to" without further explanation has been misinterpreted by patients, in some localities, that certain doctors no longer practice subspecialties; therefore, be it

Resolved, That telephone listings should be made in accordance with guidelines established by the local component societies which will consider, but not necessarily rigidly adhere to the guidelines established by the American Medical Association as interpreted by the Council of the Medical and Chirurgical Faculty; and be it further

Resolved, That a copy of this resolution be forwarded to the C & P Telephone Company and to the Reuben H. Donnelly Telephone Directory Company.

This resolution was considered in the light of the policies adopted by the Faculty's Council on November 16, 1967, which includes the following statement:

"Listings may be made *only* as follows:

Practice limited to..... (Using only those specialties being approved by the American Medical Association or as modified and approved by a special liaison group* to be named by the Faculty to work with the C & P Telephone Company)"

* Mediation Committee

It is obvious that exceptions to the rules adopted by the Council can be made. An appropriate Faculty Committee has been charged with this responsibility and indeed carefully evaluates each request for variation that occurs. Exceptions have been approved for individuals in Washington County, as well as Baltimore City, Baltimore County, Carroll County, Allegany County and others.

Your Reference Committee is of the opinion that adequate mechanisms exist for making exceptions to the rulings. It also is of the opinion that the C & P Telephone Company and the Reuben H. Donnelly Corporation both need to have some consistency in the policy that is followed throughout the State. This is particularly true where more than one county is included in the local telephone directory. The Reference Committee believes that the Council acted in a proper manner and within its authority in adopting this policy on November 16, 1967. Your Reference Committee, therefore, recommends that Resolution 3A/69 *NOT* be adopted.

In closing, your Reference Committee would like to bring to the attention of the House of Delegates that, frequently, resolutions are introduced for which policies already exist. It urges each member of the House of Delegates to convey to their component society the fact that material contained or being considered for resolutions be thoroughly investigated before introduction of resolutions that may well be unnecessary. By doing this, the time of the Committees, Delegates, Council members, Officers and Staff—as well as considerable expense —would be saved.

The Reference Committee does not wish to "gag" any group of individuals or any component society but hopes that serious consideration will be given these suggestions.

The Reference Committee wishes to express its appreciation to the Faculty staff who have so ably researched and assisted in its deliberations.

Respectfully submitted,

HERBERT H. LEIGHTON, MD, Oakland, *Chairman*
DEWITT E. DELAWTER, MD, Bethesda
WILLIAM H. MOSBERG, MD, Baltimore
EMMANUEL A. SCHIMUNEK, MD, Baltimore
RAYMOND M. YOW, MD, Salisbury

your medical faculty at work

by John Sargeant
Executive Secretary

The Faculty's Annual Meeting of the House of Delegates took place on April 9 and 11 and proceeded as follows:

1. Adopted minutes of the semiannual sessions, September 5 and 6, 1968;
2. Observed a moment's silence in memory of deceased members;
3. Adopted a resolution honoring the memory of Wetherbee Fort, MD;
4. Adopted a resolution honoring William S. Stone, MD, on the occasion of his retirement as Dean of the University of Maryland School of Medicine;
5. Awarded Viet Nam plaques to those members who have served on voluntary duty in Viet Nam;
6. Presented Fifty-year pins to those members who have completed this tenure of Faculty membership;
7. Elected certain members to Emeritus Membership and one member to Honorary Membership;
8. Disbanded the PL 89-97 Liaison Subcommittee, on recommendation of the Council;
9. Adopted a resolution appropriating sufficient funds to continue the MEDIC Network for the coming MEDIC year;
10. Presented Dean Stone with a plaque honoring his retirement;
11. Presented AMAERF checks to The John Hopkins University School of Medicine in the amount of $8,737.11; and the University of Maryland School of Medicine in the amount of $13,550.53;
12. Referred a recommendation to the Policy and Planning Committee for clarification, along with a pending amendment to the recommendation;
13. Adopted various bylaws amendments; and referred one proposed amendment to the Bylaw Committee for further study and report;
14. Elected officers for the 1970-1971 Faculty year;
15. Presented a scroll honoring his 53 years of service to the community to J. G. F. Smith, MD, of Brunswick, Md.;
16. Heard reports from the Presidents of the Woman's Auxiliary, Student American Medical Association, and the Maryland Medical Political Action Committee;
17. Adopted as amended a resolution that urges physicians to charge their Usual, Customary, and Reasonable fees for cases treated under Workmen's Compensation; and authorized legal action for a test case to determine if there is a violation of the law as it is presently written if carriers refuse to make payment on this basis;
18. Adopted as amended a resolution dealing with referral to a standing committee a proposal for formulating model group hospital and medical insurance master policies for use by employees, employers, insurance companies, and the general public;
19. Rejected a resolution dealing with the requirement that histories and physicals performed by house staff be properly authenticated and approved by a legally licensed physician on the grounds that this responsibility rested with Joint Commission on Accreditation of Hospitals;
20. Rejected a resolution that would have delegated to local component societies the determination for telephone directory yellow page listings of physicians on the basis that many directories crossed county lines; and that there needs to be uniformity throughout the state in this regard;
21. Offered the Governor any "advice, information or consultation" in connection with the appointment of a Secretary of Health and Mental Hygiene;
22. Defeated a proposed bylaw amendment offered by the Baltimore City Delegation that would have required the House to elect those Council members the Components selected for that purpose.

A Service of the Tuberculosis Association of Maryland

tuberculosis

Tuberculin Testing Program

Tuberculin tests using the standard Mantoux technique, will be offered to all persons over 15 years of age, reporting to the Maryland Tuberculosis Association Screening Center for chest X-rays. It is proposed that this program will go into effect on or about June 15, 1969. It will be considered as a demonstration aimed at determining what portion of the approximately 25,000 apparently healthy individuals reporting to the center annually react positively to the standard tuberculin test.

The Screening Center will be staffed by a registered nurse, two technicians, and one clerk-typist. The nurse will be charged with the responsibility of operating the center under the administrative supervision of the executive director of the Maryland Tuberculosis Association. A licensed physician will be in charge of the medical aspects of the program, eg, reading the X-ray films, interpreting the tuberculin test results. The registered nurse will administer the tests and measure the results for interpretation by the physician in charge. Referring physicians may elect to interpret the test results themselves. However, if they do not choose to do this, the tests will be read by the association physician.* The test will consist of the intracutaneous injection by the Mantoux technique of 0.0001 mg of standardized PPD tuberculin. This is the intermediate dose, equivalent to five tuberculin units.

The total program and policies to be followed will be constantly evaluated by a special committee appointed by the presidents of the Maryland Tuberculosis Association, Incorporated, and the Maryland Thoracic Society, with representation from the Baltimore City Health Department, the Maryland State Department of Health, and the state and city medical societies. This committee will meet regularly to evaluate and study both procedures and results.

Official support and sanction is being asked from the official agencies and medical groups represented on the committee.

An intensive education and promotional program was conducted during the months of April and May in order that all physicians, practicing in Baltimore, could be fully advised as to the program, its purposes, and its procedures.

Advice and consultation to physicians as to the handling of positive reactors will be offered to all physicians by a selected panel chosen from members of the Maryland Thoracic Society. This is believed necessary as individuals who are determined to have a positive reaction will be referred, either to a physician of their choice or to the appropriate health department for supervision.

Wide community publicity will be given so that the entire Baltimore community will be aware of the expansion of the association's case-detection program and the reasons for this expansion. Emphasis will be made of the fact that most active tuberculosis develops among positive tuberculin reactors.

The association will establish a procedure of follow-up as to final disposition of each person whose test is positive and who has been referred, with suggested chemoprophylaxis either to a health department or to a private physician. This will afford a method by which the success or failure of the program can be properly measured. In addition, thought will be given to establishing a tuberculin reactor register which will assist in determining the success of the referral and follow-up program.

All costs of the program, with the exception of the tuberculin, will be borne by the Maryland Tuberculosis Association. The Baltimore City Health De-

** Test results will be reported to the referring physician.*

partment will furnish the tuberculin without charge.

Appropriate, medically approved, educational, and promotional literature will be developed by the association for distribution to the practicing physician and the general public.

This program is being conducted as a pilot demonstration to determine the feasibility and effectiveness of offering a free tuberculin test to a cross-section of the community who would not normally report to the Mobile Chest X-ray unit or to a health department clinic for a chest X-ray.

Consultant, Tuberculosis Program, United States Public Health Service

Baltimore City physicians interested in more information on the program call Frank T. Jones, Executive Director, Maryland Tuberculosis & Respiratory Disease Association, at 685-6484.

HIGHLAND HOSPITAL

Asheville, North Carolina
Founded 1904

A DIVISION OF THE DEPARTMENT OF PSYCHIATRY OF DUKE UNIVERSITY

Accredited by the Joint Commission on Accreditation and Certified for Medicare

Complete facilities for evaluation and intensive treatment of psychiatric patients, including individual psychotherapy, group therapy, psychodrama, electro-convulsive therapy, Indoklon convulsive therapy, drugs, social services work with families, family therapy, and an extensive and well organized activities program, including occupational therapy, art therapy, athletic activities and games, recreational aotivities and outings. The treatment program of each patient is carefully supervised in order that the therapeutic needs of each patient may be realized.
High school facilities for a limited number of appropriate patients are now available on grounds. The School Program is fully integrated into the hospital treatment program and is accredited through the Asheville School System.
Complete modern facilities with 85 acres of landscaped and wooded grounds in the city of Asheville.

Brochures and information on financial arrangements available

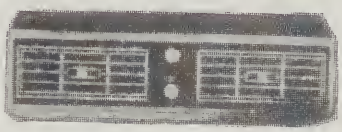
Mayor's Task Force on Nutrition

A coordinated effort, involving citizens, local, state, and federal agencies, directed toward alleviating the problem of malnutrition in Baltimore city was initiated on February 19.

The Mayor's "Task Force on Nutrition" is comprised of representatives from his office and the City Council, the Baltimore City Health Department, Baltimore City Public Schools, the Archdiocese of Baltimore, the City Department of Housing and Community Development, the Department of Agriculture (Baltimore office), the Baltimore City Department of Social Services, the Maryland State Department of Education, the Maryland State Department of Health, the State Department of Social Services, the Baltimore League of Women Voters, the Maryland Conference on Social Welfare (Child Welfare Division), the Faculty Wives' Club of The Johns Hopkins University, and the Maryland Committee for Day Care of Children.

Matthew Tayback, ScD, deputy commissioner of health of the City Health Department, is chairman of the Task Force. Regional consultants are John F. Conaboy, U.S. Department of Agriculture Regional Supervisor of Food Stamps Programs, and Miss Mary Brice Deaver, from the Children's Bureau Regional Office, Charlottesville, Va.



Some of the objectives of the Task Force include: a review of existing resources for food distribution and nutrition education, and their expansion and effective utilization; the formulation of guidelines to assist school principals in identifying children eligible for school food programs; support of the Department of Education's efforts to seek additional funds for free or reduced cost school lunches; the enforcement of federal and state legislation to expand and liberalize the school lunch and food stamp programs; and the upgrading of the nutrition status of preschool children, and the city's needy, through modification of Food Stamp and Social Services agency programs.

In seeking to attain these goals, the Mayor's Task Force is taking the initiative in a unique effort to meld agency projects into one coordinated program in order to deliver effectively the benefits of planned nutrition programs to the city's poor.

For elderly patients in need of a mild tranquilizer consider **Tybatran®**

brand of tybamate

(When you consult the Prescribing Information you may agree it makes good sense)

PRESCRIBING INFORMATION

Indications: Tybatran (tybamate) has afforded symptomatic improvement in a variety of psychoneurotic disorders, especially in the treatment of the anxiety and tension components of psychoneuroses. Anxiety states manifested somatically have responded to Tybatran (tybamate).

Tybatran (tybamate) has been useful in the control of agitation in the aged and in the alleviation of some of the adverse emotional accompaniments of senility.

Tybatran (tybamate) has been used with benefit in the treatment of depressive symptoms associated with anxiety and other symptoms of psychoneuroses. However, it is not indicated for primary treatment of depressive states. It is not an antipsychotic agent, although it has been used as adjunctive therapy in some psychotic patients.

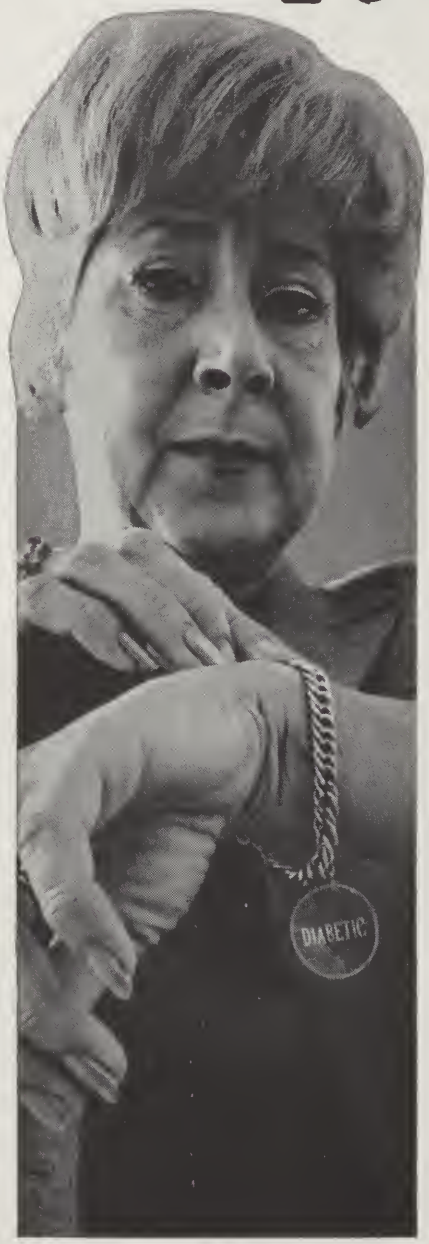
Dosage: One 350 mg. capsule, 3 times daily and two at bedtime is suggested as the adult starting dose. Adjust to suit individual requirements. Daily doses above 3000 mg. are not recommended.

Contraindications: Known hypersensitivity to tybamate. Since no studies have been done with this drug in human pregnancy, it should not be used in pregnancy unless the potential benefit outweighs the risk.

Warnings: Administer cautiously to patients receiving phenothiazines or other CNS depressants or having history of convulsive seizures (See Adverse Reactions). Consider possibility of additive actions with alcohol or other psychotropic agents, particularly phenothiazines or MAO inhibitors.

Precautions: Avoid abrupt withdrawal after prolonged use, although withdrawal symptoms have not been reported to date. Exercise caution in addiction-prone individuals. If symptoms of hypersensitivity occur, discontinue at once and initiate appropriate symptomatic treatment. Avoid activities requiring optimal mental alertness if drowsiness or vertigo are present. As with any new drug, use cautiously in patients with history of drug allergies, blood dyscrasias, and hepatic or renal disease; periodic measurements of hepatic, hematopoietic and renal function should accompany prolonged and/or high doses.

Adverse Reactions: Most frequent reactions, rarely requiring discontinuation of tybamate, include drowsiness, dizziness, nausea, insomnia, and euphoria. There have been a few reports of skin rash, urticaria, and pruritus. Rare side effects include hyperactivity, fidgetiness, flushing, and tachycardia, suggesting excessive stimulation; also ataxia, unsteadiness, confusion, feeling of unreality, "panic reaction," fatigue, headache, paresthesias, vertigo, gastrointestinal disturbances, glossitis, and dry mouth. Grand mal or petit mal seizures have been reported in a few hospitalized psychotic patients receiving tybamate (up to 6000 mg. daily) together with phenothiazines and other psychotropic agents, but not with tybamate alone. Consider the possibility of rare, serious adverse reactions such as may occur with the related drug, meprobamate. If excessive amounts are ingested, gastric lavage and symptomatic therapy, including central stimulants as necessary, are recommended. Before prescribing, consult package circular.



Supply: Tybatran (tybamate) is available in green, sealed capsules of three strengths: 350 mg., 250 mg., and 125 mg. Each strength is supplied in bottles of 100 and 500.

A. H. Robins Company, Richmond, Va. 23220

A·H·ROBINS

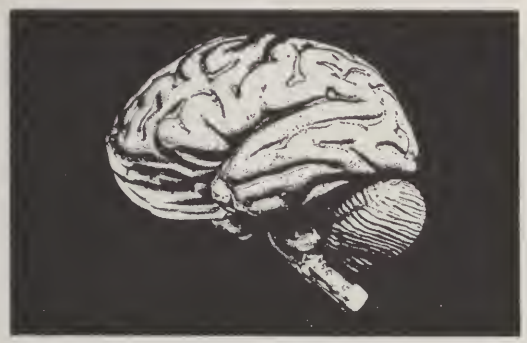
a broad-spectrum antibiotic for the diabetic:

threat or therapy?

Disordered metabolism makes her prone to bacterial infection —and to moniliasis.

When she needs tetracycline, she may also need protection against the threat of fungal overgrowth. And Tetrex-F can provide both.

Each capsule contains 250 mg. of tetracycline phosphate complex to control sensitive bacterial pathogens... and nystatin, 250,000 units, as a precautionary measure against troublesome vaginitis, proctitis or other monilial infections. However, superinfection with other, nonsusceptible organisms may occur.



Tetrex-F®
(tetracycline phosphate complex-nystatin)

PRESCRIBING INFORMATION: Tet-F. 5 —2/23/67. For complete information consult Official Package Circular.
Indications: Infections of respiratory, gastrointestinal and genitourinary tracts and skin and soft tissues due to tetracycline-sensitive organisms, in patients with increased susceptibility to monilial infections.
Contraindications: The drug is contraindicated in patients hypersensitive to its components.
Warnings: Photodynamic reactions have been produced by tetracyclines. Natural and artificial sunlight should be avoided during therapy. Stop treatment if skin discomfort occurs. With renal impairment, systemic accumulation and hepatotoxicity may occur. In this situation, lower doses should be used. Tooth staining and enamel hypoplasia may be induced during tooth development (last trimester of pregnancy, neonatal period and childhood).
Precautions: Bacterial superinfections may occur. Infants may develop increased intracranial pressure with bulging fontanels. In gonorrheal therapy, serologic tests for syphilis should be conducted initially and monthly for 3 months.
Adverse Reactions: Glossitis, stomatitis, nausea, diarrhea, flatulence, proctitis, vaginitis, dermatitis, and allergic reactions may occur.
Usual Adult Dosage: 1 capsule q.i.d. Continue for 10 days in Beta-hemolytic streptococcal infections. Administer one hour before or two hours after meals.
Supplied: Capsules, bottles of 16 and 100. Each capsule contains tetracycline phosphate complex equivalent to 250 mg. tetracycline HCl activity and 250,000 units of nystatin.

For Oral Suspension, 125 mg. tetracycline and 125,000 u. nystatin/5 ml., 60 ml. bottles. **A.H.F.S. Category 8:12**

Maryland State department of mental hygiene

On The Care of The Mentally Subnormal

Maryland currently requires 1,126 hospital beds for the retarded in addition to available capacity to meet the state's estimated minimum need. Although construction at Rosewood and the opening of Henryton has provided space for 770 patients since 1960, this has barely exceeded the increased need resulting from Maryland's burgeoning population. The average size of the patient population is now 16.6% above bed capacity, a slight reduction from the 20.3% noted in 1960.

FISCAL YEAR	BED CAPACITY*	AVERAGE SIZE OF PATIENT POPULATION	EXCESS PATIENTS	ESTIMATED BED NEED**	ADDITIONAL BEDS NEEDED
1960	1,873	2,254	381	3,017	1,144
1962	1,873	2,400	527	3,166	1,293
1964	2,073	2,616	543	3,353	1,280
1966	2,564	2,888	324	3,551	987
1968	2,624	3,089	465	3,692	1,068
1969 (est.)	2,643	3,085	442	3,769	1,126

*** Based on an average of 70 square feet of bed space.**
****One Bed for every 1,000 estimated total state residents as recommended by the American Association on Mental Deficiency.**

A new facility, now being built near Beltsville in the Washington metropolitan area, will have an initial capacity for 230 patients. Other planned and authorized construction at Rosewood, Beltsville, and in a number of smaller units in different sections of the state, will provide space for approximately 840 additional patients by 1972. However, since the minimum bed need is estimated to increase by then to 3,974, Maryland will still have a deficiency of at least 261 beds when the current building program is completed.

The above data provide one indication of the need for expanded support for mental retardation programs. Other available indices* show that Maryland, in comparison with other states, ranked 23 in average expenditure per patient, 30 on the number of beds per 1,000 total residents and 32 on the ratio of personnel to patients. On each of the above factors, Maryland was below the national average.

Since Maryland's total population is growing by approximately 65,000 people a year, it must be anticipated that the demand for inpatient services will similarly increase. The immediate need, therefore, is for continuing construction together with improved staffing ratios in present and future facilities. Longer range efforts must relate to (1) research and preventive programs for reducing the incidence of mental retardation; (2) increased training and educational programs for the retarded to permit maximum development of their potential; and (3) establishment and expansion of closely coordinated community centered services such as, day care centers, halfway houses, sheltered workshops, group care homes, small residential facilities, and other suitable substitutes for hospitalization.

Medical Team Sketches Portrait of Alcoholic

Despite all the attention given to it, alcoholism remains a most perplexing medical problem. Though regarded by many as a disease entity, it has no characteristic course and no accepted way of management. Yet the physician is under increasing pressure from society—and medicine itself—to treat the alcoholic.

What should the doctor do for the alcoholic during the acute stages of intoxication and during the period of withdrawal? What associated illnesses or conditions should he look for? To help the doctor answer these questions, the Alcoholism and Drugs Addiction Research Foundation of Ontario set up a 32-bed research and treatment unit in the summer of 1967. By the fall of 1970, this unit will become the nucleus of the foundation's new 110-bed hospital on the University of Toronto campus for the study and treatment of patients who are dependent on drugs or alcohol.

So far, more than 1,000 patients have gone through the unit run by the foundation, which is an agency of the provincial government. The team, headed by Jack Olin, MD, the unit's medical director, has found the expected neglect, scars, telangiectasia, spider nevi, and hepatic enlargements. But they have also found a number of unexpected clinical signs.

A particularly common finding was *Candida albicans* infection in the mouths of alcoholics. The infection—far advanced in some cases—has shown up in almost 50% of the 500 alcoholics seen by Murray Cornish, DDS, a dentist who works as a consultant in the unit. By contrast, he has seen these fungal infections in only 1% of the patients in his private practice.

Dr. Cornish, who is head of oral diagnosis at Toronto's New Mount Sinai Hospital, has also observed hyperkeratinization in the gums of alcoholics —probably from the rubbing of ill-fitting dentures and gnashing of teeth. In addition, he has come across far advanced cases of papillary hyperplasia of the tongue, a condition he believes is frequently precancerous.

The relationship between oral lesions and neoplasms is a potentially fruitful area of medical research, says Dr. Cornish. He notes that last year in Ontario, which has a population of more than seven million, dentists found only five oral neoplasms among patients in their practices. The dental service at the alcoholic unit, on the other hand, has detected between 18 and 20 oral neoplasms. One of these tumors, a basal cell carcinoma of the lip, was apparently triggered by the repeated burning down of cigarettes while the patient was anesthetized by alcohol.

Perhaps the most surprising report to come out of the unit is: Very few alcoholics have cirrhosis. Medical director Olin notes that in less than 1% of their patients, who are usually referred by private practitioners, were the unit's doctors able to confirm a diagnosis of the liver disorder.

"The picture of alcoholism and cirrhosis is grossly distorted in general hospital statistics," charges Dr. Olin. He feels that the incidence of cirrhosis in even chronic abusers in the general population is no greater than 4%.

The diagnostic label of cirrhosis "is affixed to a large number of alcoholics who, in fact, have only a fatty liver," asserts Paul Devenyi, MD, senior physician at the unit. He notes that in a series of 100 randomly selected alcoholics—all of whom had been drinking steadily up to the time of admission—liver biopsies showed that two thirds of them had fatty livers. But only two turned out to have cirrhosis.

"Since the majority of alcoholics develop transient fatty liver, but only a few of these develop cirrhosis,

Reprinted by permission of *Medical World News*, © copyright 1969 McGraw-Hill, Inc.

we cannot say that fatty liver leads to cirrhosis," says Dr. Devenyi. "Something besides alcohol or nutritional deficiency is necessary for the development of cirrhosis—perhaps a constitutional or genetic predisposition that we do not understand as yet."

Nor do nutritional deficiencies seem to be responsible for fatty liver. The condition is found just as often among those alcoholics who do eat as among those who do not eat while drinking, reports Dr. Olin. "This finding tends to support the thesis that alcohol, acting as a direct toxin, is the important factor producing liver damage."

Another unexpected finding was that 10% of the chronic alcoholics were color-blind. This discovery partly supports earlier reports by a group in Chile. But though the Chileans found yellow-blue deficiencies, the Toronto group detected red-green deficiencies. Whether these patients will recover from their color blindness if they abstain from alcohol remains to be seen.

Treating the alcoholic patient poses special problems if the doctor, like those in the Toronto unit, sees him while he is suffering from acute intoxication or from acute withdrawal. But, even though the intoxicated patient may be irrational and violent, he is usually handled at the unit without the aid of sedatives and tranquilizers.

Since alcohol itself is a central nervous system depressant, giving the patient another CNS depressant while he is drunk may lead to unpredictable results—even death, says Dr. Devenyi. "We find that most intoxicated patients can be managed by avoiding argument and getting them gently to bed. Left alone, they will fall asleep without any medication. We meticulously avoid any CNS-depressing drugs in patients whose blood alcohol level exceeds 0.15%.

Theoretically, the patient would benefit from a drug that would speed up the metabolism of alcohol. A number of agents—including triiodothyronine, insulin, and glucose—have been tried. But Dr. Devenyi knows of nothing that can accelerate alcohol metabolism reliably.

"Although sedatives are avoided during acute intoxication, they are the key to effective management of the patient during the withdrawal stage," says the Toronto physician. At the alcoholic unit, benzodiazepines such as chlordiazepoxide (*Librium*) and diazepam (*Valium*) are preferred to the phenothiazines, which may cause a sudden drop in blood pressure and, in some cases, convulsions. Barbiturates are avoided in all phases of alcoholism treatment, notes Dr. Devenyi, because alcoholic patients also show a high incidence of barbiturate abuse.

He says chlordiazepoxide is given in fairly high doses—100 mg intramuscularly or sometimes intravenously—every hour or two for about 12 hours. Then the drug is administered orally, the dosage gradually being reduced to 50 mg and then 25 mg three or four times a day.

Room for 'Hair of the Dog'?

One of the most popular remedies for alcohol withdrawal symptoms—the one used most often by alcoholics—is alcohol itself. Dr. Devenyi does not hold with the theory that a hair of the dog that bit you is a good remedy. "It only serves to perpetuate the vicious round of drinking."

Once the medical doctor has dealt with the acute phases of alcoholism, other professionals must assume an increasing role in maintaining the patient's sobriety, says Dr. Devenyi. But, he says, the doctor should not step out of the picture completely. Medical care—judicious use of antidepressants and tranquilizers, administration of disulfiram (Antabuse)—may still be needed. "One should make an effort to see that the patient is not discharged with nowhere to go, but that he will get some sort of support, supervision, psychotherapy, or whatever he may need."

rehabilitation notes

Osteoarthritis of the Hip

Arthritis Foundation Series
The Arthritis Foundation
(Maryland Chapter, 12 West 25th St., Balto., Md. 21218)
is arranging a series of articles by experts on arthritis to appear from time to time in Rehabilitation Notes.

NORTON I. GETTES, MD
Instructor in Orthopaedic Surgery
Johns Hopkins University

Osteoarthritis of the hip is a condition which usually develops when, for one reason or another, articular cartilage is caused to be worn away or destroyed on either the weight-bearing surface of the head of the femur or the acetabulum or both. The arthritis can develop as a result of a circulatory disturbance producing avascular necrosis of the head of the femur or from old sepsis, old trauma, or excessive "wear and tear." It can also result from a generalized joint disease process or from a congenital or developmental disorder, such as congenital dislocation of the hip, Legg-Perthes disease, or slipping of the capital femoral epiphysis. As a result of any of the foregoing disturbances, deformity in the joint develops. The usually congruous joint becomes incongruous. The deformity ultimately results in narrowing of the joint space, osteophyte formation, and superior and lateral subluxation of the femoral head. This then produces pain and loss of motion. This combination of pain and loss of motion in a major weight-bearing joint is particularly disabling.

The diagnosis is made on the basis of the history, and the physical and X-ray examinations. Pain resulting from hip joint disease is frequently present in the knee or anterior thigh. It tends to be aggravated by activity and relieved by rest. As hip motions become restricted, fixed deformities begin to develop, usually consisting of losses of internal rotation and extension and abduction. The patient most usually presents with a fixed flexion deformity, and with the hip in adduction and external rotation. Such a patient will often complain that the sound leg feels too long. Atrophy of the thigh musculature is always found. The differential diagnosis of disease in the lumbar spine or the sacro-iliac joints must be considered, but usually can be ruled out when the finding of specific limitation of motion in the hip joint is established.

Some of the X-ray findings have already been mentioned. The most common is narrowing of the hip joint space. Other changes to follow are sub-

chondral bone sclerosis with areas of cyst formation in both the femoral head and the acetabulum, and deformity of the femoral head with osteophyte formation and areas of bony collapse. Characteristically, one sees superior and lateral subluxation of the femoral head which is secondary to the defomity in the head and also to the formation of bonc within the acctabulum.

There are no specific laboratory findings in osteoarthritis. Studies to rule out gout, rheumatoid arthritis, and the connective tissue disorders should be carried out.

Once the diagnosis of osteoarthritis has been established, then the problem of management and treatmcnt arises. Many factors must then bc taken into consideration: the age, sex, occupation, body habitus, and the wants and desires of the patient. In any patient with established osteoarthritis of the hip, medications in common usage such as, indomethacin *(Indocin),* phenylbutazone *(Butazolidin),* and similar compounds are of no permanent benefit, although they may afford temporary relief. The use of systemic corticosteroids is specifically contraindicated in this condition.

The basic cornerstone of treatment should be to put the hip to rest and to provide appropriate analgesic medication, usually in the form of aspirin or aspirin-containing compounds. The hip is best put to rest in bed, until the symptoms subsidc. Traction, using skin straps, is sometimes necessary. Once the pain has been relieved and muscle spasm subsides, then the patient can be ambulated with crutches, using a three point gait if one hip is involved, or a four point gait if both hips are involved. Physical therapy in the form of moist heat and assisted active exercises is helpful. Special attention should be directed toward the prevention of fixed deformities and the preservation of strength in the important abductor muscles of the hip. Hydrotherapy, the usc of a warm pool, and swimming are all helpful adjuncts in treatment. Once the symptoms have been controlled, then the patient often can be advanced to a canc which is best carried in the hand opposite the affected hip. When this patient cannot achieve sufficient freedom from pain or when limited motion or deformity is so severe as to be disabling, then surgery usually becomes necessary.

At the prescnt time, the two basic approaches to the surgical treatment of osteoarthritis of the hip are osteotomy and arthroplasty. Osteotomy means to cut a bone, and arthroplasty means to make a joint. For the sake of completeness, two othcr procedures have been employed in the treatment of osteoarthritis of the hip. These are hip fusion and hip joint resection with or without osteotomy.

Hip fusion has been recommended in younger patients where there is unilateral disease without the likelihood of arthritis developing in the other hip. This is most likely to occur in those situations where the arthritis in the involved hip is secondary to trauma, or to some other older developmental condition which has run its course. Hip fusion can be accomplished by a variety of methods. When the hip is fused, then excess strain is imposed upon the other joints in the weight bearing chain, in order to allow the patient to be sufficiently mobile. These other joints are the lumbar spine, the sacro-iliac joints, and the knees. To some extent, the opposite hip is also involved. Successful fusion can be guaranteed to relicve pain, but loss of motion is the price that must be paid.

Joint rcsection, with or without osteotomy, involves removing the head and neck of the femur. When this is done without ostcotomy, it is known as a Girdlestone procedure, and when it is done with an abduction osteotomy (abducting the distal fragment), it is known as the Milch or Batchelor procedure. Both procedures are effective in relieving pain and producing mobilc hips, but stability of the joint for weight bearing is lost to a great degree. These procedures are most often performed in older patients who would not have the strength to tolerate the others, or they are performed as "salvage" procedures when other operations on the hip have failed.

The ostcotomy most frequently cmployed is a displacement intertrochanteric, one called a McMurray osteotomy. Here the femur is cut across just proximal to the lesser trochanter and thc distal fragment is displaced medially for a distance of one third to one half the diameter of thc shaft. Then the fragments are fixed with a device called a spline, which has a blade that penctrates the trochanteric bone, and a side plate that is screwed to the distal shaft.

The most successful form of arthroplasty is that where thc hip joint, or what is left of it, is opened and dislocated. Then the head of the femur and the acetabulum are reshaped with special tools so that they will be concentric with one another. Then a device called a cup or hip mold, which is made of vitallium steel, is interposed between the two bony surfaces. This cup is not fixed either to the femur or the acetabulum, but is free to move on the femoral head and in the acetabulum. The cup sits on the femoral head much in the way that a thimble fits on a thumb. The operation is combined with a total capsulectomy, debridement of the joint, and release of any contracted and deforming muscles such as the psoas. This muscle is not dicarded, but instead is moved to a more favorable position so that its function will not be lost.

The indications for osteotomy require, in addition to those for hip surgery, that the joint have a reasonable range of motion, usually more than 70 degrees of flexion and extension, and that the joint

be fairly congruous. If these conditions cannot be met, then arthroplasty is the procedure of choice. Pain relief is usually immediate following arthroplasty, but may require several months following osteotomy. The osteotomy usually requires three months to unite, during which time the patient uses crutches. After bony union has occurred, full weight bearing is allowed with the aid of a cane. Arthroplasty requires a period of protected weight bearing for at least one year, the first six months on crutches and the last six months with a cane. The range of motion does not usually improve or increase following osteotomy, but is expected to do so after a successful arthroplasty. Arthroplasty requires more of a patient than does osteotomy, because the patient has to learn to use his new hip and to care for it. This requires periods of exercise and rest, and patience. Chronological age is not a contraindication to arthroplasty, and there have been many successful arthroplasties performed on patients in their seventies.

The patient with osteoarthritis of the hip, by judicious management employing physical and medical aids, and by surgery when indicated, need not be consigned to a life of immobility and pain, or the confines of a wheelchair, but can look forward to relief of pain with restoration of the use and motion of that joint.

JUDGE ANTIBIOTIC OINTMENTS HERE

Results on skin are final proof of any topical antibiotic's effectiveness

No in vitro test can duplicate a clinical situation on living skin. 'Neosporin' (polymyxin B—bacitracin—neomycin) Ointment has consistently proven its effectiveness in thousands of cases of bacterial skin infection. The spectra of the three antibiotics overlap in such a way as to provide bactericidal action against most pathogenic bacteria likely to be found topically. Diffusion of the antibiotics from the special petrolatum base is rapid since they are insoluble in the petrolatum, but readily soluble in tissue fluids. The Ointment is bland and nonirritating.

Caution: As with other antibiotic preparations, prolonged use may result in overgrowth of nonsusceptible organisms and/or fungi. Appropriate measures should be taken if this occurs. Articles in the current medical literature indicate an increase in the prevalence of persons allergic to neomycin. The possibility of such a reaction should be borne in mind.

Contraindications: This product is contraindicated in those individuals who have shown hypersensitivity to any of its components.

Supplied: Tubes of 1 oz., ½ oz. with applicator tip, and ⅛ oz. with ophthalmic tip.

Complete literature available on request from Professional Services Dept. PML.

'NEOSPORIN'®
brand

POLYMYXIN B-BACITRACIN-NEOMYCIN OINTMENT

BURROUGHS WELLCOME & CO. (U.S.A.) INC., Tuckahoe, N.Y.

Mild ulcerative colitis may be triggered here...

In mild ulcerative colitis, a number of factors can precipitate an attack: for instance, dietary indiscretion, such as eating raw foods, or emotional overreaction, such as that aroused by financial difficulties. No matter what causes the patient's sensitive colon to "act up," he soon suffers from acute discomfort...and often, from anxiety and apprehension as well. Such patients frequently respond well to adjunctive dual-action Librax® therapy.

Librax combines, in a single convenient capsule, the well-known antianxiety effect of Librium® (chlordiazepoxide HCl) and the dependable anticholinergic/antispasmodic effect of Quarzan® (clidinium Br). Therefore, as Librax helps to relieve the patient's excessive anxiety and reduce his overreaction to stress, it also, at the same time, helps to control hypersecretion and hypermotility, thus relieving spasm and abdominal discomfort.

With Librax, the dosage schedule is simple: 1 or 2 capsules, t.i.d. or q.i.d., will in most cases bring the patient significant relief of both the emotional and physical elements that contribute to his psychovisceral disorder.

Before prescribing, please consult complete product information, a summary of which follows.

INDICATIONS: Indicated as adjunctive therapy to control emotional and somatic factors in gastrointestinal disorders.

CONTRAINDICATIONS: Patients with glaucoma; prostatic hypertrophy and benign bladder neck obstruction; known hypersensitivity to chlordiazepoxide HCl and/or clidinium bromide.

WARNINGS: Caution patients about possible combined effects with alcohol and other CNS depressants. As with all CNS-acting drugs, caution patients against hazardous occupations requiring complete mental alertness (*e.g.*, operating machinery, driving). Though physical and psychological dependence have rarely been reported on recommended doses, use caution in administering Librium (chlordiazepoxide hydrochloride) to known addiction-prone individuals or those who might increase dosage; withdrawal symptoms (including convulsions), following discontinuation of the drug and similar to those seen with barbiturates, have been reported. Use of any drug in pregnancy, lactation, or in women of childbearing age requires that its potential benefits be weighed against its possible hazards. As with all anticholinergic drugs, an inhibiting effect on lactation may occur.

PRECAUTIONS: In elderly and debilitated, limit dosage to smallest effective amount to preclude development of ataxia, oversedation or confusion (not more than two capsules per day initially; increase gradually as needed and tol-

or here.

(ated). Though generally not recommended, if combination therapy with other psychotropics seems indicated, carefully consider individual pharmacologic effects, particularly in use of potentiating drugs such as MAO inhibitors and phenothiazines. Observe usual precautions in presence of impaired renal or hepatic function. Paradoxical reactions (*e.g.*, excitement, stimulation and acute rage) have been reported in psychiatric patients. Employ usual precautions in treatment of anxiety states with evidence of impending depression; suicidal tendencies may be present and protective measures necessary. Variable effects on blood coagulation have been reported very rarely in patients receiving the drug and oral anticoagulants; causal relationship has not been established clinically.

ADVERSE REACTIONS: No side effects or manifestations not seen with either compound alone have been reported with Librax. When chlordiazepoxide hydrochloride is used alone, drowsiness, ataxia and confusion may occur, especially in the elderly and debilitated. These are reversible in most instances by proper dosage adjustment, but are also occasionally observed at the lower dosage ranges. In a few instances syncope has been reported. Also encountered are isolated instances of skin eruptions, edema, minor menstrual irregularities, nausea and constipation, extrapyramidal symptoms, increased and decreased libido—all infrequent and generally controlled with dosage reduction; changes in EEG patterns (low-voltage fast activity) may appear during and after treatment; blood dyscrasias (including agranulocytosis), jaundice and hepatic dysfunction have been reported occasionally with chlordiazepoxide hydrochloride, making periodic blood counts and liver-function tests advisable during protracted therapy. Adverse effects reported with Librax are typical of anticholinergic agents, *i.e.*, dryness of mouth, blurring of vision, urinary hesitancy and constipation. Constipation has occurred most often when Librax therapy is combined with other spasmolytics, and/or low residue diet.

two good reasons for prescribing LIBRAX®

Each capsule contains 5 mg chlordiazepoxide HCl and 2.5 mg clidinium Br.

ROCHE
LABORATORIES

Nutley, New Jersey 07110

Nose clear as a whistle

(THANKS TO DIMETAPP®)

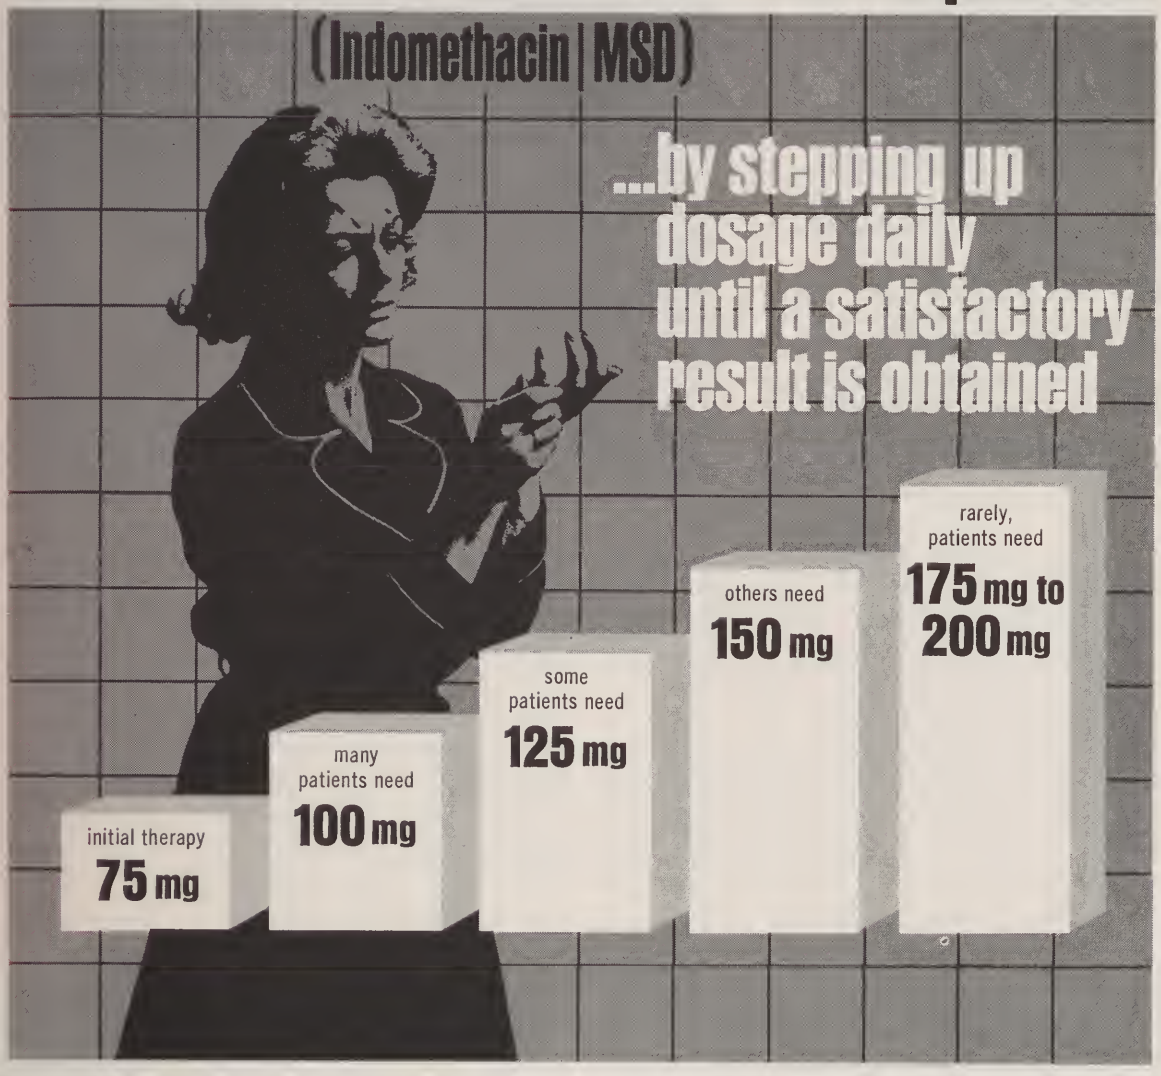
Dimetapp Extentabs® does an outstanding job of helping to clear up the stuffiness, drip and congestion of colds and upper respiratory allergies and infections. Each Extentab keeps working up to 12 hours. And for most patients drowsiness or overstimulation is unlikely. Try Dimetapp. It clearly works.

FOR UPPER RESPIRATORY ALLERGIES AND INFECTIONS

Dimetapp Extentabs®

Dimetane® (brompheniramine maleate), 12 mg.; phenylephrine HCl, 15 mg.; phenylpropanolamine HCl, 15 mg.

UP TO 12 HOURS CLEAR BREATHING ON ONE TABLET



Indications: Dimetapp is indicated for symptomatic relief of the allergic manifestations of respiratory illnesses, such as the common cold and bronchial asthma, seasonal allergies, sinusitis, rhinitis, conjunctivitis, and otitis.
Contraindications: Hypersensitivity to antihistamines. Not recommended for use during pregnancy.
Precautions: Until patient's response has been determined, he should be cautioned against engaging in operations requiring alertness. Administer with care to patients with cardiac or peripheral vascular diseases or hypertension.
Side Effects: Hypersensitivity reactions including skin rashes, urticaria, hypotension and thrombocytopenia, have been reported on rare occasions. Drowsiness, lassitude, nausea, giddiness, dryness of the mouth, mydriasis, increased irritability or excitement may be encountered.
Dosage: 1 Extentab morning and evening.
Supplied: Bottles of 100 and 500.

RICHMOND, VA. 23220

A·H·ROBINS

In selected cases of rheumatoid arthritis with acute symptoms

Response to INDOCIN® is often improved...

Many patients with acute rheumatoid arthritis or acute episodes of chronic rheumatoid arthritis can be controlled by increasing the dosage 25 mg *per day* (to the allowable maximum) until the episode subsides; the dosage should then be reduced gradually to maintenance levels. Few require the maximum (175–200 mg).

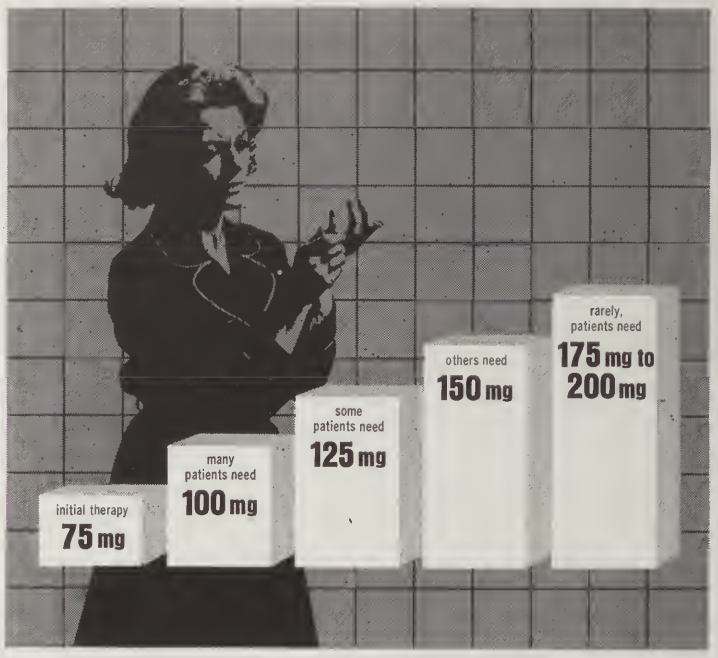
In the event the patient develops adverse effects, dosage should be reduced to tolerated levels for 2 or 3 days and then gradually increased by 25 mg every few days as tolerated. G.I. effects may be minimized by giving INDOCIN with food, antacids, or immediately after meals.

Now in two strengths
25 mg and 50 mg

Actual Size

INDOCIN®
(Indomethacin | MSD)

IMPORTANT NOTE: INDOCIN (Indomethacin, MSD) cannot be considered a simple analgesic and should not be used in conditions other than those recommended under *Indications*. The drug should not be prescribed for children because safe conditions for use have not been established.



CONTRAINDICATED:

- in aspirin-sensitive asthmatics
- during pregnancy or lactation
- in children
- INDOCIN may mask the signs and symptoms of peptic ulcer and may cause ulceration or irritation of the G.I. tract. Therefore, do not give in active peptic ulcer, gastritis, regional enteritis, ulcerative colitis, and use with caution if there is a history of these disorders.

For additional prescribing information, please see following page.

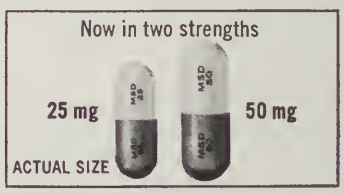
In selected cases
of rheumatoid arthritis
with acute symptoms

Response to INDOCIN® (Indomethacin | MSD) is often improved by stepping up dosage daily until a satisfactory result is obtained

IMPORTANT NOTE: INDOCIN (Indomethacin, MSD) cannot be considered a simple analgesic and should not be used in conditions other than those recommended under Indications. The drug should not be prescribed for children because safe conditions for use have not been established.

Indications: For the symptomatic treatment of rheumatoid arthritis, rheumatoid (ankylosing) spondylitis, degenerative joint disease (osteoarthritis) of the hip, and gout.

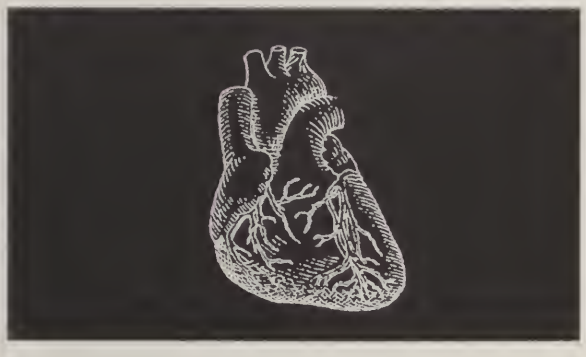
Contraindications: INDOCIN may mask the signs and symptoms of peptic ulcer and may itself cause peptic ulceration or irritation of the G.I. tract. For these reasons it should not be given to patients with active peptic ulcer, gastritis, regional enteritis, or ulcerative colitis (use with caution if there is history of these disorders); aspirin-sensitive asthmatics. Safe use during pregnancy or during lactation has not been established. Should not be prescribed for children because safe conditions for use have not been established. In a few cases of severe juvenile rheumatoid arthritis receiving INDOCIN along with other drugs, severe reactions, including fatalities, have been reported.



Warnings: Patients who experience dizziness, lightheadedness, or feelings of detachment on INDOCIN should be cautioned against operating motor vehicles or machinery, climbing ladders, etc. Use cautiously in patients with psychiatric disturbances, epilepsy, or parkinsonism since it may aggravate these conditions.

Precautions: Use cautiously in patients with a history of peptic ulcer, gastritis, regional ileitis, or ulcerative colitis because of its potential for causing G.I. bleeding. May cause single or multiple ulceration of the esophagus, stomach, duodenum, or small intestine, and, in a few Instances, severe bleeding and perforation with a few fatalities have been reported. May potentiate the ulcerogenic effect of steroids, salicylates, or phenylbutazone. Gastrointestinal bleeding with no obvious ulcer formation has also been noted; the drug should be discontinued if G.I. bleeding occurs. As a result of obvious or occult G.I. bleeding, some patients may manifest anemia, and for this reason periodic hemoglobin determinations are recommended. G.I. effects may be minimized by giving the drug with food or with antacids or immediately after meals. In common with other drugs that have anti-inflammatory, analgesic, and antipyretic properties, indomethacin may mask the signs and symptoms of infection; avoid undue delay in initiating appropriate treatment of the infection; use cautiously in patients with existing, but controlled, infections. As with any new drug, patients should be followed carefully to detect unusual manifestations of drug sensitivity.

Adverse Reactions: Starting therapy with low doses, with gradual increases when necessary, will minimize adverse reactions. *Central Nervous System:* Most commonly, headache (usually more severe in morning), dizziness, and lightheadedness; infrequently observed reactions include mental confusion, drowsiness, convulsions, coma, depression, and other psychic disturbances, such as depersonalization; CNS effects are often transient and frequently disappear with continued treatment or reduced dosage. The severity of these effects may occasionally require cessation of therapy. *Gastrointestinal:* Most commonly, nausea, anorexia, vomiting, epigastric distress, abdominal pain, and diarrhea; others that may develop are ulceration, single or multiple, of esophagus, stomach, duodenum, or small intestine, including perforation and hemorrhage with a few fatalities having been reported; G.I. bleeding without obvious ulcer formation, increased abdominal pain in patients with preexisting ulcerative colitis; less commonly, stomatitis; gastritis; bleeding from the sigmoid colon, occult in type or from a diverticulum, and perforation of preexisting sigmoid lesions (diverticulum, carcinoma); G.I. reactions not known definitely to be attributable to indomethacin include development of ulcerative colitis and of regional ileitis. *Hepatic:* Rarely, jaundice and hepatitis. *Cardiovascular-Renal:* Infrequently, edema, elevation of blood pressure, and hematuria. *Dermatologic-Hypersensitivity:* Infrequently, pruritus, urticaria, angioneurotic edema, angiitis, skin rashes, loss of hair, and acute respiratory distress including sudden dyspnea and asthma. *Hematologic:* Infrequently, leukopenia, purpura, and thrombocytopenia; rarely, agranulocytosis and bone marrow depression have been reported, but a definite relationship to the drug has not been established; since some patients may manifest anemia secondary to obvious or occult G.I. bleeding, periodic hemoglobin determinations are recommended. *Eye-Ear:* Infrequently, tinnitus, blurred vision, hearing disturbance, and orbital and periorbital pain. *Miscellaneous:* Rarely, vaginal bleeding, hyperglycemia, and glycosuria.



Supplied: Capsules containing 25 mg indomethacin each, in bottles of 100 and 1000; capsules containing 50 mg indomethacin each, in bottles of 100.

Antibiotic Chemoprophylaxis in Cardiac Surgery

MORTON I. RAPOPORT, MD
Assistant Professor of Medicine

ROLENDO SABUNDAYO, MD
Fellow in Medicine

Division of Infectious Diseases
Department of Medicine
University of Maryland School of Medicine

Infection remains the most serious complication of modern cardiovascular surgery. The factors, which in large measure contribute to this problem, include cardiopulmonary bypass, use of synthetic graft materials, ambitious corrective procedures requiring prolonged surgery, and massive transfusions. However, infectious complications are not to be viewed as reasons for not performing cardiovascular surgery, but rather as undesirable sequels which, presumably, can be prevented.

The most feared and clearly the most catastrophic form of postoperative infection is that of endocarditis. This infection may occur as a result of bacteremia induced either from the bypass apparatus itself, intravenous catheters, or from numerous other sites. On the other hand, the occurrence of bacteremia cannot be invoked as the primary cause of postoperative endocarditis since it has been established that numerous host factors are altered in these patients. Impaired phagocytic functions, lysosomal disruption, and white cell destruction have all been observed to varying degrees in patients after cardiopulmonary bypass.

The organisms most frequently encountered in this form of infection have been staphylococci, although streptococci, pneumococci, and gram-negative organisms (including salmonella, klebsiella and E. coli) have been seen with increased frequency. Isolated reports of postoperative endocarditis due to various species of diphtheroids are also appearing with increased frequency. Finally, fungal infections, especially candidiasis, have been encountered in this setting.

Once endocarditis has become an established fact in the postoperative cardiac surgery patient, the disease assumes a fulminant course. In spite of early specific antimicrobial administration, the mortality rate remains high. Frequently reoperation, requiring removal or replacement of prosthetic valves, and removal of suture material or other graft material, is necessary in order to assure success of the chemotherapeutic program.

While the issue has not been settled with any degree of finality, it does seem that antibiotic chemoprophylaxis may be efficacious in preventing infectious complications of cardiac surgery. Most investigators agree that a significant reduction in the incidence of postoperative endocarditis can be achieved by a program of antibiotic administration beginning 12-24 hours preoperatively and lasting five to ten days postoperatively. A study in progress at our hospital has tended to confirm this observa-

tion. Our own observations, in agreement with others, have established that different chemoprophylactic regimens are effective. However, the inclusion of a penicillinase resistant penicillin seems to be most important, since the most commonly isolated organisms in this form of endocarditis have been penicillin-resistant staphylococci. Virtually all of the chemotherapeutic programs in use stress the importance of effective antibiotic blood levels at the time of surgery, since this appears to be the most vulnerable period during which the infecting organisms become engrafted.

Unfortunately, the data accumulated, regarding endocarditis in post-cardiac-surgery patients and the efficacy of chemoprophylaxis, have been erroneously applied to other forms of cardiovascular manipulation. Some clinicians have suggested that data obtained in post-cardiac-surgery patients are relevant to patients undergoing cardiac catheterization, pacemaker insertions, etc. This is clearly not the case, since no data thus far have been able to establish any effectiveness for antibiotics in this setting.

In summary, while the data should at this time be interpreted with some degree of caution, it would appear that cardiac surgery is one of those few forms of surgery in which antibiotic chemoprophylaxis may play a role in infection prevention.

College To Establish Registry Of Organ Transplantations

The American College of Surgeons has been requested by the National Institutes of Health to establish and administer a registry of human transplantation cases performed in the United States. Transplantations performed abroad may also be included, pending negotiations now being conducted between the college and federal agencies.

The transplantation registry, which will be housed at college headquarters under the supervision of a transplant coordinator, will include the heart, liver, lungs, spleen, pancreas, thymus, gonads, and bone marrow. Kidney transplants, which are already being monitored by an effective kidney transplant registry, will not be included.

The broad objectives of the transplantation registry are: to provide a firm, reliable mechanism for recording biologic information on transplantations already performed; to share rapidly accumulating transplant data on a worldwide basis; to avoid widespread repetition of individual misadventures, and to point out favorable avenues for further investigation.

An ad hoc committee appointed by the Board of Regents will assist the college and NIH in the development of the registry. The committee consists of C. Rollins Hanlon, St. Louis, chairman; J. Englebert Dunphy, San Francisco, and William P. Longmire, Jr., Los Angeles.

FOOD AND DRUG ADMINISTRATION

Bureau of Medicine
IS SEEKING

- **PHYSICIANS**—Board certified or Board eligible in various specialties.
- **The Board of Medicine,** one of the major divisions of FDA, is responsible for developing medical policy on the efficacy and safety of drugs, medical devices, and substances used in foods, drugs, cosmetics, and hazardous household products. The individual physician is assigned to one of four major subdivisions of the Bureau and reviews and evaluates scientific and clinical data relating to safety and efficacy of drugs, medical devices, and substances.
- **Starting salary $19,771** with assured periodic increases; excellent fringe benefits; professional development programs; equal opportunity; U.S. citizenship required. (The proposed pay increase would raise the starting salary to approximately $21,600 in July 1969 if approved.)
- **Located in Arlington, Virginia** in modern office-apartment-shopping complex.
- Major relocation expenses reimbursed.
- Submit brief resume or for complete information submit inquiry to:

What makes a

A man?
Another woman?
Three kids?
No kids at all?
Wrinkles?
You name it.

Is she truly depressed?

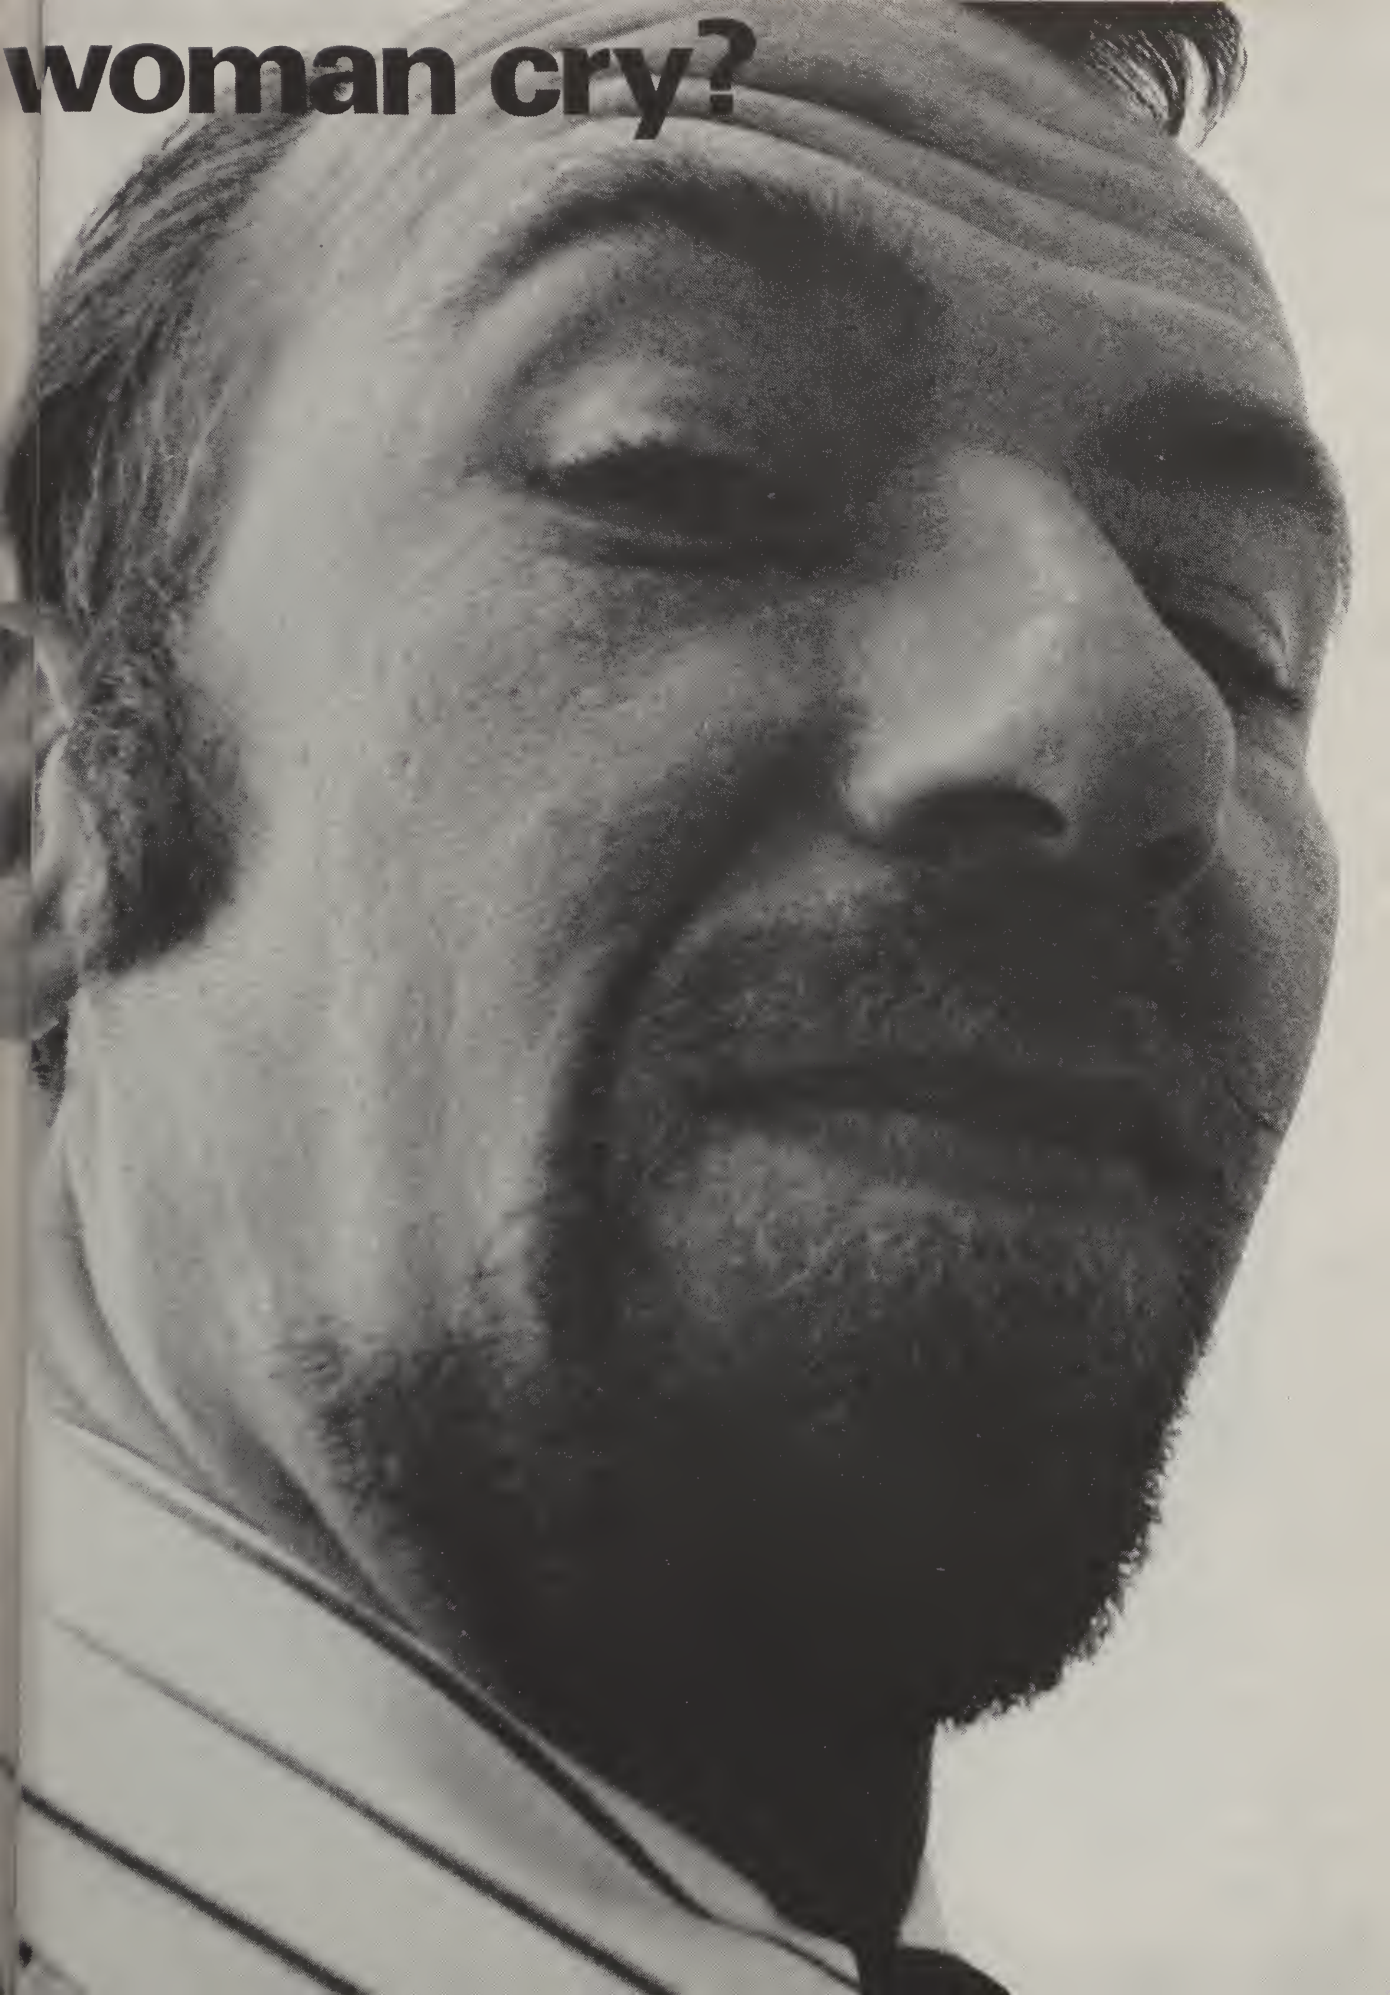
Is that why she lets go in your office?

You comfort her.
Talk to her.
And, if she is depressed, consider Pertofrane.
Because
in 3 to 5 days
she can often begin
to cope,
work,
maybe play,
even enjoy.

Pertofrane®

desipramine hydrochloride
In depression...
when words are not enough

But before you prescribe Pertofrane, please see the full prescribing information and especially note Contraindications, Precautions, Warning, Adverse Reactions and Dosage. A brief summary of that information is included here.



Pertofrane® desipramine hydrochloride

Indications: For relief of depression.
Contraindications: Do not use drugs of the M.A.O.I. class with Pertofrane. Hyperpyretic crises or severe convulsive seizures may occur; potentiation of adverse effects can be serious or even fatal. When substituting this drug in patients receiving an M.A.O.I., allow an interval of at least 7 days. Initial dosage in such patients should be low and increases should be gradual and cautiously prescribed.
Warning: Activation of psychosis may occasionally be observed in schizophrenic patients. Do not use in patients under 12 years old, and do not use in women who are or may become pregnant unless the clinical situation warrants the potential risk.
Precautions: Careful supervision and protective measures for potentially suicidal patients are necessary. Discontinuation of therapy or adjunctive use of a sedative or tranquilizer may be necessary in the presence of increased anxiety or agitation, hypomania or manic excitement. However, phenothiazines may aggravate the condition. Atropine-like effects may be more pronounced (e.g. paralytic ileus) in susceptible patients and in those receiving anticholinergic drugs (including antiparkinsonism agents). Carefully observe patients with increased intraocular pressure. Prescribe cautiously in hyperthyroid patients and in those receiving thyroid medications. Cardiovascular complications (myocardial infarction and arrhythmias) are potential risks since they have occasionally occurred with imipramine, the parent compound. Desipramine may block the pharmacologic activity of guanethidine and related adrenergic neuron-blocking agents. Hypertensive episodes have been observed during surgery in patients on desipramine therapy.
Before prescribing the drug, the physician should be thoroughly familiar with prescribing information, with the literature, with all adverse reactions, with the diagnosis and management of depression, and with the relative merits of all measures for treating the condition.
Adverse Reactions: Dry mouth, constipation, disturbed visual accommodation, anorexia, perspiration, insomnia, drowsiness, dizziness, headache, nausea, epigastric distress, and skin rash (including photosensitization) may appear. Since orthostatic hypotension has occurred, carefully observe patients requiring concomitant vasodilating therapy, particularly during the initial phases. Other adverse reactions include tachycardia, changes in EEG patterns, tremor, falling, mild extrapyramidal activity, neuromuscular incoordination, epileptiform seizures. A confusional state (with such symptoms as hallucinations and disorientation) occurs occasionally and may require reduced dosage or discontinuance of therapy. Rarely, transient eosinophilia, slight elevation in transaminase levels, transient jaundice, or liver damage have occurred. If abnormalities occur in liver function tests, discontinue drug and investigate. Occasional hormonal effects, particularly decreased libido or impotence and instances of gynecomastia, galactorrhea and female breast enlargement have been observed. Urinary frequency or retention may occur. The drug should be discontinued if agranulocytosis, bone marrow depression, jaundice, thrombocytopenia, or purpura occur.
Dosage: 25 to 50 mg. t.i.d. The maximum daily dose is 200 mg. Continue maintenance dosage for at least 2 months after obtaining satisfactory response. Generally, elderly and adolescent patients should be given low doses.
Availability: Pink capsules of 25 mg. in bottles of 100 and 1000. (B) 46-530-E

OCEAN CITY CONVENTION HALL UNDER WAY

Completion of the Convention Hall now under construction will provide Ocean City with one of the most beautiful facilities of its kind on the east coast. Long favored as a convention center because of its many fine hotels and motels, Ocean City will now have ideal accommodations for large conventions, sales meetings, trade shows, private parties and banquets, as well as cultural and sporting events.

The Convention Hall will accommodate 3100 people for a convention, and approximately 2000 for a banquet. On either side of the main arena will be ten meeting rooms seating from 50 to 300. Exhibit space is provided both in a large hall and individual booths. Parking area for 950 cars, with sheltered loading is to be provided. Completely modern, air-conditioned and heated, Convention Hall will undoubtedly be a busy center of activity in all seasons.

Drownproofing

Teach your child drownproofing.

Drownproofing, according to the Health Insurance Institute, consists of a series of arm and leg movements that help a person move up and down instead of forward.

Detailed instructions for teaching this technique to youngsters are now being provided on a new wallet-sized card published free of charge by the U.S. Public Health Service.

If performed correctly, reports the PHS, it will allow a child to survive in the water for hours, even if it is rough.

The PHS card, "Safety Tips In-Out-and-Around the Water" may be obtained free in quantities up to 100 by writing to the Injury Control Program, National Center for Urban and Industrial Health, 222 East Central Parkway, Cincinnati, Ohio 45202.

A little Hygroton

chlorthalidone

MY-6674

an work a long diuretic day

the way from one daily tablet to the next
help control edema and hypertension

prolonged action usually provides smooth, sustained diuretic
ectiveness; real one-a-day dosage, right from the start; convenience
d economy.

ygroton, chlorthalidone, can cause side effects. And it's contra-
dicated in hypersensitivity to the drug and severe renal and
epatic diseases.

heck the prescribing information. It's summarized on the next page.

Geigy

A little Hygroton® can work a long diuretic day

chlorthalidone

Indications: Hypertension and many types of edema involving retention of salt and water.

Contraindications: Hypersensitivity and most cases of severe renal or hepatic diseases.

Warning: With the administration of enteric-coated potassium supplements, which should be used only when adequate dietary supplementation is not practical, the possibility of small-bowel lesions (obstruction, hemorrhage, and perforation) should be kept in mind. Surgery for these lesions has been required frequently and deaths have occurred. Discontinue enteric-coated potassium supplements immediately if abdominal pain, distention, nausea, vomiting, or gastrointestinal bleeding occur.

Use with caution in pregnant women and nursing mothers since the drug may cross the placental barrier and appear in cord blood and since thiazides may appear in breast milk. The drug may result in fetal or neonatal jaundice, thrombocytopenia, and possibly other adverse reactions which have occurred in the adult. When used in women of childbearing age, balance benefits of drug against possible hazards to fetus.

Precautions: Antihypertensive therapy with this drug should always be initiated cautiously in postsympathectomy patients and in patients receiving ganglionic blocking agents, other potent antihypertensive drugs or curare. Reduce dosage of concomitant antihypertensive agents by at least one-half. Because of the possibility of progression of renal damage, periodic determination of the BUN is indicated. Discontinue if the BUN rises or liver dysfunction is aggravated. Hepatic coma may be precipitated.

Electrolyte imbalance, sodium and/or potassium depletion may occur. If potassium depletion should occur during therapy, the drug should be discontinued and potassium supplements given, provided the patient does not have marked oliguria.

Take special care in cirrhosis or severe ischemic heart disease and in patients receiving corticosteroids, ACTH, or digitalis. Salt restriction is not recommended.

Adverse Reactions: Nausea, gastric irritation, vomiting, anorexia, constipation and cramping, dizziness, weakness, restlessness, hyperglycemia, glycosuria, hyperuricemia, headache, muscle cramps, orthostatic hypotension, which may be potentiated when chlorthalidone is combined with barbiturates, narcotics or alcohol, aplastic anemia, leukopenia, thrombocytopenia, agranulocytosis, impotence, dysuria, transient myopia, skin rashes, urticaria, purpura, necrotizing angiitis, acute gout, and pancreatitis when epigastric pain or unexplained G.I. symptoms develop after prolonged administration. Other reactions reported with this class of compounds include: jaundice, xanthopsia, paresthesia, and photosensitization.

Average Dosage: 50 or 100 mg. with breakfast daily or 100 mg. every other day.

Availability: White, single-scored tablets of 100 mg. and aqua tablets of 50 mg., in bottles of 100 and 1000.

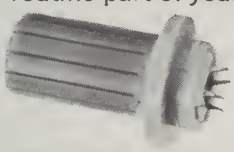
Skilled Hands For The O.R.

The shortage of professional nurses to assist the surgeon at the operating table is an old story now. There is no reason to hope that it will ever be overcome. In fact, with the closing of many hospital based schools for nurses and the reduced time alloted for actual operating room experience in the remaining nurses training courses, it is certain that this personnel shortage will grow worse.

It is vitally important that satisfactory replacements be found if the welfare of patients is not to be placed in jeopardy by exposure to unqualified personnel, and if operating suites in hospitals are to operate at full capacity.

There is too much at stake to permit the introduction of untrained people into the operating team with the expectation that they can be adequately trained on the job. A basic course of education and indoctrination must be completed before these aides, recruited from outside sources, can be trusted in the aseptic environment of the operating room. The military services have amply demonstrated that personnel drawn from civilian occupations can be trained by the nursing corps of the services to become thoroughly adequate and trustworthy operating room technicians. Many surgeons became aware of this during World War II and in Korea, and began to question why the lesson might not be applied to peacetime civilian hospitals. There was need for specifications for such training, position openings in this category, and a national sponsoring body.



A committee of the Board of Governors of the American College of Surgeons devoted much time and study to this problem from 1962 to 1965. From the outset they were aware that the leadership and the actual instruction of these technicians must be assumed by professional nurses. There was initially an unfortunate misunderstanding that surgeons were intruding into the nurses' sphere. The Association of Operating Room Nurses, however, accepted the challenge and at the end of 1967 produced an excellent training manual entitled "Teaching the Operating Room Technician."

In the meantime, even in the absence of a standardized curriculum, training courses had been developed in various areas under the auspices of individual hospitals, often in collaboration with a nearby junior college giving academic credits. The quality of these courses is still uneven and there is, at present, no good way of evaluating the training and experience of an operating room technician who may have been trained elsewhere. The AORN is presently attempting to rectify this situation. It is giving support and guidance to an organization known as the Association of Operating Room Technicians (AORT) whose members qualify by examination or training in meeting the standards of the AORN. (There are other organizations of surgical technicians which do not have this endorsement.)

Copies of the manual "Teaching the Operating Room Technician," and lists of training programs meeting its standards, may be obtained from the Educational Director, Association of Operating Room Nurses, 575 Madison Avenue, New York, N.Y. 10022. Fellows of the ACS are urged to give their support to this commendable undertaking.

TB is still around.

In 1967 almost 45,000 new active cases were reported. Isn't that a good reason to make tuberculin testing with the white LEDERTINE™ Applicator a routine part of your physical examinations?

TUBERCULIN TINE TEST
(Rosenthal) with Old Tuberculin

Precautions: With a positive reaction, consider further diagnostic procedures. Use with caution in persons with active tuberculosis or known allergy to acacia. Vesiculation, ulceration, or necrosis may occur at the test site in highly sensitive persons.

Lederle LEDERLE LABORATORIES
A Division of American Cyanamid Company, Pearl River, N.Y.

Convalescing . . . but still a long way to go. Anxiety can make it even longer.

Convalescence following medical or surgical procedures may be almost endless to an anxious patient. And, indeed, anxiety with some patients actually retards progress—for example, by inducing insomnia and reducing cooperation.

As physicians have found during nearly 15 years of widespread use, Equanil may be a beneficial part of aftercare. It helps relieve anxiety and tension, thus often aiding your primary therapy.

Indications: For use in management of anxiety and tension occurring alone or as accompanying symptom complex to medical and surgical disorders and procedures. Though not a hypnotic, fosters normal sleep through antianxiety and related muscle-relaxant properties.

Contraindications: History of sensitivity to meprobamate.

Important Precautions: Carefully supervise dose and amounts prescribed, especially for patients prone to overdose themselves. Excessive prolonged use has been reported to result in dependence or habituation in susceptible persons, as alcoholics, ex-addicts, and other severe psychoneurotics. After prolonged excessive dosage, reduce dosage gradually to avoid possibly severe withdrawal reactions. Abrupt discontinuance of excessive doses has sometimes resulted in epileptiform seizures.

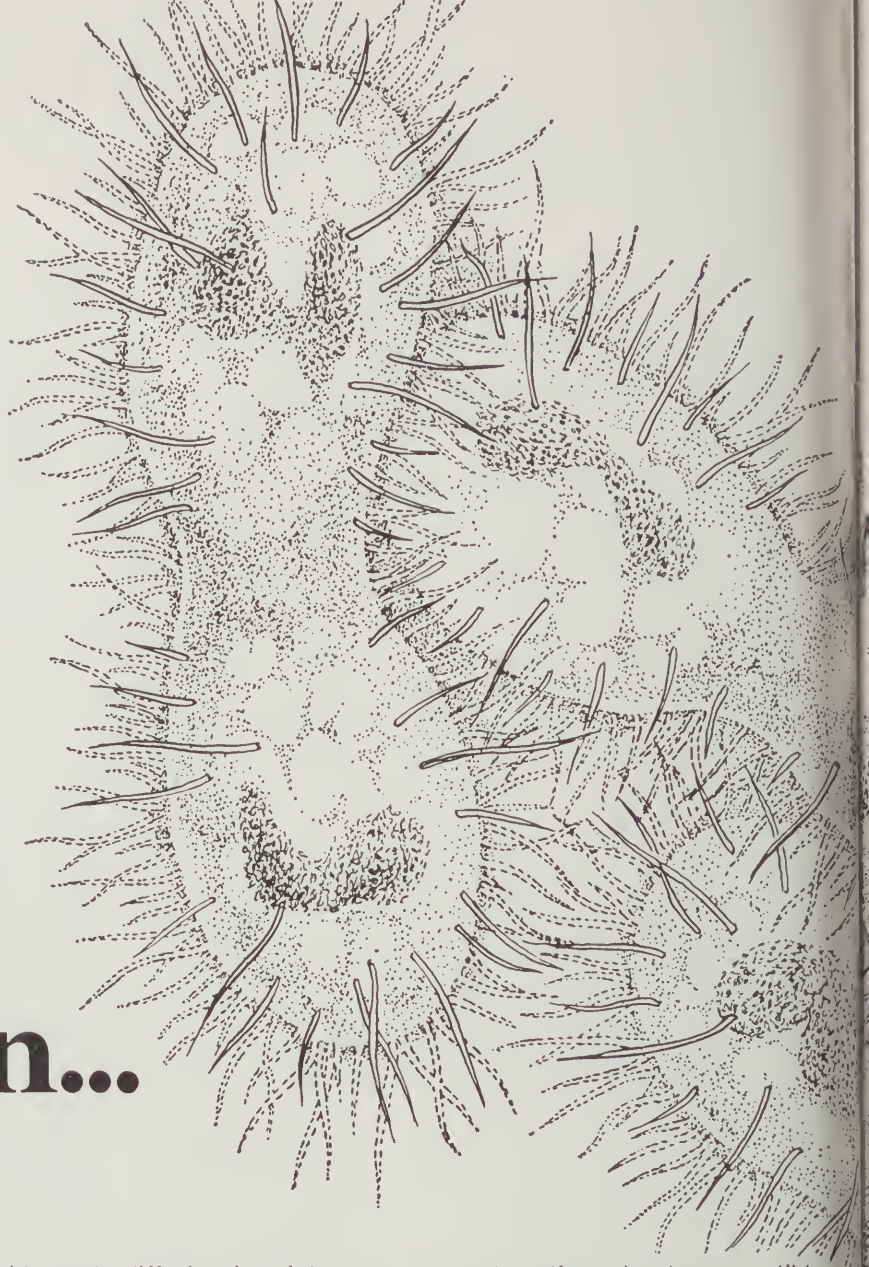
Warn patients of possible reduced alcohol tolerance, with resultant slowing of reaction time and impairment of judgment and coordination.

Reduce dose if drowsiness, ataxia or visual disturbance occurs; if persistent, patients should not operate vehicles or dangerous machinery.

Side Effects include drowsiness, usually transient; if persistent and associated with ataxia, usually responds to dose reduction; occasionally concomitant CNS stimulants (amphetamine, mephentermine sulfate) are desirable. Allergic or idiosyncratic reactions are rare, but such reactions, sometimes severe, can develop in patients receiving only 1 to 4 doses who have had no previous contact with meprobamate. Previous history of allergy may or may not be related to incidence of reactions. Mild reactions are characterized by itchy urticarial or erythematous maculopapular rash, generalized or confined to groin. Acute nonthrombocytopenic purpura with cutaneous petechiae, ecchymoses, peripheral edema and fever have been reported. One fatal case of bullous dermatitis following intermittent use of meprobamate with prednisolone has been reported. If allergic reaction occurs, meprobamate should be stopped and not reinstituted. Severe reactions, observed very rarely, include angioneurotic edema, bronchial spasms, fever, fainting spells, hypotensive crises (1 fatal case), anaphylaxis, stomatitis and proctitis (1 case) and hyperthermia. Treat symptomatically as with epinephrine, antihistamine and possibly hydrocortisone. Aplastic anemia (1 fatal case), thrombocytopenic purpura, agranulocytosis and hemolytic anemia have occurred rarely, almost always in presence of known toxic agents. A few cases of leukopenia, usually transient, have been reported on continuous administration.

Meprobamate may sometimes precipitate grand mal attacks in patients susceptible to both grand and petit mal. Extremely large doses can produce rhythmic fast activity in the cortical pattern. Impairment of accommodation and visual acuity has been reported rarely. After excessive dosage for weeks or months, withdraw gradually (1 or 2 weeks) to avoid recurrence of pretreatment symptoms (insomnia, severe anxiety, anorexia). Abrupt discontinuance of excessive doses has sometimes resulted in vomiting, ataxia, tremors, muscle twitching and epileptiform seizures. Prescribe very cautiously and in small amounts for patients with suicidal tendencies. Suicidal attempts have resulted in coma, shock, vasomotor and respiratory collapse and anuria. Excessive doses have resulted in prompt sleep; reduction of blood pressure, pulse and respiratory rates to basal levels; and occasionally hyperventilation. Treat with immediate gastric lavage and appropriate symptomatic therapy. (CNS stimulants and pressor amines as indicated.) Doses above 2400 mg./day are not recommended.

Composition: Tablets, 200 mg. and 400 mg. meprobamate. Coated Tablets, WYSEALS® EQUANIL (meprobamate) 400 mg. (All tablets also available in REDIPAK® [strip pack], Wyeth.) Continuous-Release Capsules, EQUANIL L-A (meprobamate) 400 mg.



EQUANIL®
(meprobamate)

Wyeth®

A high index of suspicion... E. coli

How high is the "index of suspicion" for *E. coli* in urinary tract infections?

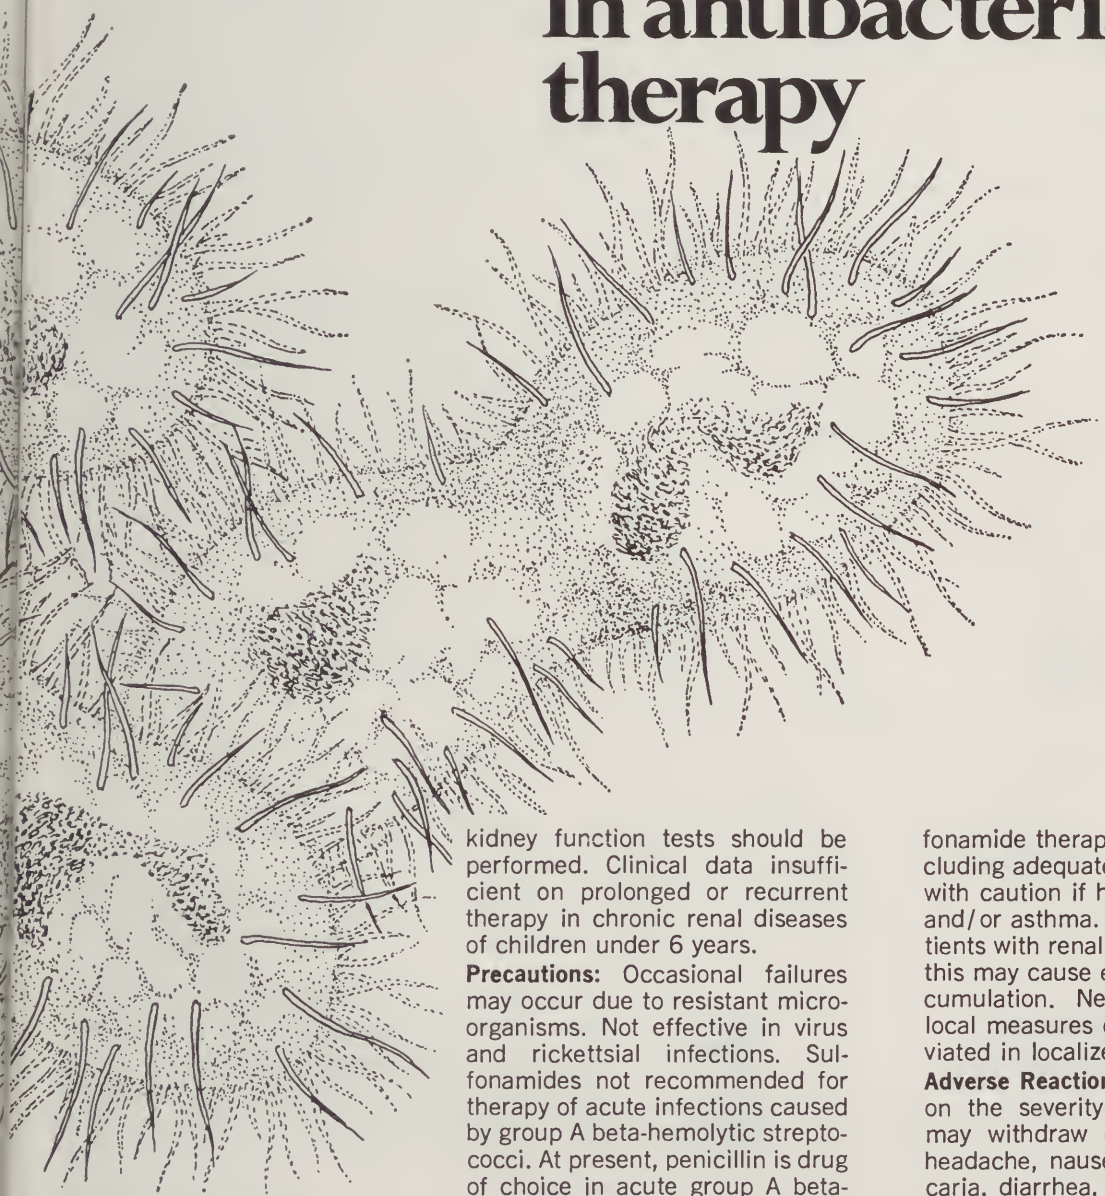
Recently it has been estimated that about 86 per cent of positive cultures in first attacks of urinary tract infection are *E. coli*.[1] It has also been noted that "The coliform group, especially *E. coli*, accounts for approximately 90 per cent of initial infections...."[2]

Consider wide-spectrum Gantanol® (sulfamethoxazole) for its high "index of confidence"—its proven effectiveness against *E. coli* and other sensitive gram-negative and gram-positive organisms. Therapeutic levels of Gantanol in blood and urine are achieved within 2 hours after a 2-Gm starting dose, with ready diffusion into interstitial fluids. Responsive infections generally clear within 5 to 7 days, with relief of symptoms usually seen within 24-48 hours.

Gantanol also earns its high "index of confidence" because Gantanol therapy is relatively free from complications, including the problem of bacterial resistance or superinfection.

Convenient, economical dosage schedule: *b.i.d.*

References: 1. Vernier, R. L., in Patient Care Feature: *Patient Care, 1*:20 (Feb.) 1967. **2.** Beeson, P. B.: "The Infectious Diseases," in Beeson, P. B., and McDermott, W. (eds.): *Cecil-Loeb Textbook of Medicine*, ed. 12, Philadelphia, W. B. Saunders Company, 1967, p. 230.



Before prescribing, please consult complete product information, a summary of which follows:

Indications: Acute and chronic urinary tract, respiratory and soft tissue infections due to susceptible microorganisms; prophylactically following diagnostic instrumental procedures on genitourinary tract.

Contraindicated in sulfonamide-sensitive patients, pregnant females at term, premature infants, or newborn infants during first 3 months of life.

Warnings: Use only after critical appraisal in patients with liver or renal damage, urinary obstruction or blood dyscrasias. Deaths reported from hypersensitivity reactions, Stevens-Johnson syndrome, agranulocytosis, aplastic anemia and other blood dyscrasias. In closely intermittent or prolonged therapy, blood counts and liver and

For a high index of confidence... Gantanol® (sulfamethoxazole) in antibacterial therapy

Artist's rendition of E. coli. As with most strains of E. coli, these have flagella and are motile.

kidney function tests should be performed. Clinical data insufficient on prolonged or recurrent therapy in chronic renal diseases of children under 6 years.

Precautions: Occasional failures may occur due to resistant microorganisms. Not effective in virus and rickettsial infections. Sulfonamides not recommended for therapy of acute infections caused by group A beta-hemolytic streptococci. At present, penicillin is drug of choice in acute group A beta-hemolytic streptococcal infections; although Gantanol has produced favorable bacteriologic conversion rates in this infection, data insufficient on long-term follow-up studies as to its effect on sequelae of rheumatic fever or acute glomerulonephritis. If other treatment cannot be used and Gantanol is employed in such infections, *important that therapy be continued in usual recommended dosage for at least 10 days.* Observe usual sulfonamide therapy precautions, including adequate fluid intake. Use with caution if history of allergies and/or asthma. Follow closely patients with renal impairment since this may cause excessive drug accumulation. Need for indicated local measures or surgery not obviated in localized infections.

Adverse Reactions: Depending upon the severity of the reaction, may withdraw drug in event of headache, nausea, vomiting, urticaria, diarrhea, hepatitis, pancreatitis, blood dyscrasias, neuropathy, drug fever, Stevens-Johnson syndrome, skin rash, injection of the conjunctiva and sclera, petechiae, purpura, hematuria and crystalluria.

When disease is ruled out and psychic tension is implicated

Valium® (diazepam) helps relax the patient and relieve his somatic symptoms

Before prescribing, please consult complete product information, a summary of which follows:

Indications: Tension and anxiety states; somatic complaints which are concomitants of emotional factors; psychoneurotic states manifested by tension, anxiety, apprehension, fatigue, depressive symptoms or agitation; acute agitation, tremor, delirium tremens and hallucinosis due to acute alcohol withdrawal; adjunctively in skeletal muscle spasm due to reflex spasm to local pathology, spasticity caused by upper motor neuron disorders, athetosis, stiff-man syndrome, convulsive disorders (not for sole therapy).

Contraindicated: Known hypersensitivity to the drug. Children under 6 months of age. Acute narrow angle glaucoma.

Warnings: Not of value in psychotic patients. Caution against hazardous occupations requiring complete mental alertness. When used adjunctively in convulsive disorders, possibility of increase in frequency and/or severity of grand mal seizures may require increased dosage of standard anticonvulsant medication; abrupt withdrawal may be associated with temporary increase in frequency and/or severity of seizures. Advise against simultaneous ingestion of alcohol and other CNS depressants. Withdrawal symptoms have occurred following abrupt discontinuance. Keep addiction-prone individuals under careful surveillance because of their predisposition to habituation and dependence. In pregnancy, lactation or women of childbearing age, weigh potential benefit against possible hazard.

Precautions: If combined with other psychotropics or anticonvulsants, consider carefully pharmacology of agents employed. Usual precautions indicated in patients severely depressed, or with latent depression, or with suicidal tendencies. Observe usual precautions in impaired renal or hepatic function. Limit dosage to smallest effective amount in elderly and debilitated to preclude ataxia or oversedation.

Side Effects: Drowsiness, confusion, diplopia, hypotension, changes in libido, nausea, fatigue, depression, dysarthria, jaundice, skin rash, ataxia, constipation, headache, incontinence, changes in salivation, slurred speech, tremor, vertigo, urinary retention, blurred vision. Paradoxical reactions such as acute hyperexcited states, anxiety, hallucinations, increased muscle spasticity, insomnia, rage, sleep disturbances, stimulation, have been reported; should these occur, discontinue drug. Isolated reports of neutropenia, jaundice; periodic blood counts and liver function tests advisable during long-term therapy.

How much does illness and lost time cost you?

KEX FLOOR PLAN PACKAGE —SERVICED BY RENTEX— IS EFFECTIVE AGAINST INFECTIOUS GERMS!

Read this Important News Now: — The U.S. Dept. of Agriculture has accepted the following claims for KEX Services:

- "KEX" Walk-Off-Mats are chemically treated with an anti-microbial additive to inhibit the growth and spread of environmental bacteria in a mat and to reduce contamination in the areas serviced by Walk-Off-Mats.
- "KEX" Walk-Off-Mats are effective against Staph Aureus.
- "KEX" Walk-Off-Mats reduce populations of air and dust-borne Staph Aureus in the areas serviced by Walk-Off-Mats.
- "KEX" Walk-Off-Mats reduce the introduction of bacterial populations in rooms serviced by Walk-Off-Mats.

Help clean the air for you and your employees. Let your Rentex Service expert show you how to minimize air borne bacteria with KEX Services. Act Now — TODAY! Call CE. 3-5700.

LACTINEX®

TABLETS & GRANULES

■ **to help restore and stabilize the intestinal flora**

■ **for fever blisters and canker sores of herpetic origin**

Lactinex contains both *Lactobacillus acidophilus* and *L. bulgaricus* in a standardized viable culture, with the naturally occurring metabolic products produced by these organisms.

Lactinex has been shown to be useful in the treatment of gastrointestinal disturbances, and for relieving the painful oral lesions of fever blisters and canker sores of herpetic origin.[1,2,3,4,5,6,7,8]

No untoward side effects have been reported to date.

Literature on indications and dosage available on request.

DECLOSTATIN® 300

Demethylchlortetracycline HCl 300 mg
and Nystatin 500,000 units
CAPSULE-SHAPED TABLETS Lederle

b.i.d.

To guard susceptible patients against intestinal monilial overgrowth during broad-spectrum therapy—the protection of nystatin is combined with demethylchlortetracycline in DECLOSTATIN.

For your susceptible candidates, prescribe DECLOSTATIN—the broad-spectrum therapy that prevents monilial overgrowth.

Effectiveness: Because its antibacterial component is DECLOMYCIN Demethylchlortetracycline, DECLOSTATIN should be equally or more effective therapeutically than other tetracyclines in infections caused by tetracycline-sensitive organisms. The antifungal component, Nystatin, protects against superinfection by antibiotic-resistant fungal overgrowth (particularly monilia) in the intestinal tract.

Contraindication: History of hypersensitivity to demethylchlortetracycline or nystatin.

Warning: In renal impairment, usual doses may lead to excessive accumulation and liver toxicity. Under such conditions, lower than usual doses are indicated, and, if therapy is prolonged, serum level determinations may be advisable. A photodynamic reaction to natural or artificial sunlight has been observed. Small amounts of drug and short exposure may produce an exaggerated sunburn reaction which may range from erythema to severe skin manifestations. In a smaller proportion, photoallergic reactions have been reported. Patients should avoid direct exposure to sunlight and discontinue drug at the first evidence of skin discomfort. Necessary subsequent courses of treatment with tetracyclines should be carefully observed.

Precautions: Overgrowth of nonsusceptible organisms may occur. Constant observation is essential. If new infections appear, appropriate measures should be taken. In infants, increased intracranial pressure with bulging fontanels has been observed. All signs and symptoms have disappeared rapidly upon cessation of treatment.

Side Effects: Gastrointestinal system—anorexia, nausea, vomiting, diarrhea, stomatitis, glossitis, enterocolitis, pruritus ani. Skin—maculopapular and erythematous rashes; a rare case of exfoliative dermatitis has been reported. Photosensitivity; onycholysis and discoloration of the nails (rare). Kidney—rise in BUN, apparently dose related. Transient increase in urinary output, sometimes accompanied by thirst (rare). Hypersensitivity reactions—urticaria, angioneurotic edema, anaphylaxis. Teeth—dental staining (yellow-brown) in children of mothers given this drug during the latter half of pregnancy, and in children given the drug during the neonatal period, infancy and early childhood. Enamel hypoplasia has been seen in a few children. If adverse reaction or idiosyncrasy occurs, discontinue medication and institute appropriate therapy. Demethylchlortetracycline may form a stable calcium complex in any bone-forming tissue with no serious harmful effects reported thus far in humans.

Average Adult Daily Dosage: 150 mg q.i.d. or 300 mg b.i.d. Should be given 1 hour before or 2 hours after meals, since absorption is impaired by the concomitant administration of high calcium content drugs, foods and some dairy products. Treatment of streptococcal infections should continue for 10 days, even though symptoms have subsided.

Maryland State Medical Journal

VOLUME 18 JULY 1969 NUMBER 7

CONTENTS:

What is a Psychiatrist? Walter Weintraub, MD 75

"In attempting to describe the responsibilities and areas of competence of the psychiatrist, one is tempted to simplify the task by creating the best possible image for the profession, and by avoiding controversial issues. To do so, however, would not only be an insult to the intelligence of a sophisticated audience, but would hardly advance the purposes of promoting interdisciplinary relationships."

Clergy-Physician Dialogues 77

"The particular interest and value of these discussions is that they come out of the experience of clergymen and physicians dealing with patients daily. The problems encountered are concrete, immediate, and very real to those involved. There is a determination to make Christian concern relevant to the lives of suffering people in hospitals."

ON THE COVER: In the spirit of Independence Day we have selected an original painting by **Robert Yealdhall,** a Baltimore artist. The JOURNAL staff offers no aesthetic interpretation except to say that if we don't start looking after our nation a bit better, the United States will begin to resemble the tree on the far-right panel—sparse, bare, broken, and devoid of life. The painting is from the collection of **Mr. and Mrs. John Sargeant.**

IMPORTANT DATES

THURSDAY, FRIDAY, SATURDAY, SEPTEMBER 4, 5, 6, 1969

SEMIANNUAL MEETING OF THE MEDICAL AND CHIRURGICAL FACULTY

at the

HOTEL HERSHEY, HERSHEY, PENNSYLVANIA

The Semiannual Meeting in Hershey has been geared to many scientific and social functions:

Thursday, September 4

Executive Committee and Council Meetings

Fun for all—MONTE CARLO NIGHT—For physicians, their wives and guests

Friday, September 5

MEETINGS: House of Delegates
Woman's Auxiliary

Scientific program on "DRUG ABUSE—SOME ALTERNATIVES"
(Of interest to physicians, their wives and guests)

MMPAC Luncheon (Maryland Medical Political Action Committee)—"WHAT'S IT ALL ABOUT?"

Cocktail Party and Semiannual Banquet

TOURS: Hershey Medical Center (Devoted to the production of Family Physicians)
Chocolate Town and Factory

Saturday, September 6

MEETINGS: College of Surgeons
Diabetes Association
Psychiatric Society
Rheumatic Diseases
Nursing Home Physicians
Board of Directors, Maryland Academy of General Practice

TOURS: Amish Country, including a "Pennsylvania Dutch" lunch

GOLF TOURNAMENT

ENTERTAINMENT—A surprise evening

If your hotel reservation has not been made, fill in the reservation form and mail today. September 4-6 will be a weekend of worthwhile postgraduate education, as well as one of relaxation and fun for all. The complete program will be mailed the first week in August to all members, and to others upon request.

DeWitt E. DeLawter, MD, Chairman
Committee on Program and Arrangements

For reservation form, see next page.

AUGUST 14-15, 1969
GERMANTOWN ACADEMY

3rd Annual Germantown Academy Symposium on Sports Medicine: Academy's Fort Washington, Pa. campus. The symposium is designed for and open to physicians, nurses, trainers, coaches, administrators, and all others interested or involved in school medicine, sports, and conditioning. Frank J. Tornetta, MD, president of the Montgomery County Medical Association, will deliver a welcoming address. For further information, contact: William R. Talbot, Jr., Tel. MI 6-3300, Ext 34 (Fort Washington, Pa.)

SEPTEMBER 25-27, 1969
CHICAGO COMMITTEE ON TRAUMA/AMERICAN COLLEGE OF SURGEONS

3rd Annual Postgraduate Course for Emergency Room Nurses: Palmer House Hotel, Chicago. Advance registration is required and should be accompanied by the tuition fee of $60, which covers three full days of scientific sessions and the chairman's reception and banquet. Address registration fees and inquiries to: George T. Anast, MD, Chairman, 55 East Washington St., Chicago, Ill. 60602.

1 out of 3 Marylanders belongs to BLUE SHIELD®

Today more than one million Marylanders are Blue Shield members. Last year alone, they received more than $20 million in medical and surgical care benefits. And since there are more than four thousand Maryland groups now offering this form of coverage to their employees, there must be a good reason—or reasons—for the preference for Blue Shield.

One very important reason is the unselfish devotion of you and your colleagues to the Blue Shield concept.

To find out more about Blue Shield, just use the convenient coupon.

DATES TO REMEMBER

Deadline for Resolutions for Semiannual Meeting:

FRIDAY, JULY 11, 1969

Reference Committee Hearing (for resolutions up for consideration at the Semiannual Meeting):

Thursday, August 14, 1969, 7:30 p.m.

Semiannual Meeting, Hershey, Pa., September 4, 5, 6, 1969

Charter trip to Spain, October 12-21, 1969 (tentative)

Annual Meeting, Baltimore, Md., April 1, 2, 3, 1970

Charter trip to the Far East, May 1, 1970 (14 days)

REPORTS IN THE WORKS

In the near future, look for reports from the Faculty on Drug Addiction... Multiphasic Screening...Admission policies for Coronary Care and Intensive Care Units... Legal rulings on Consent Forms...and Medical Care for the Emancipated Minor.

All of these and more are under study within Faculty ad hoc groups working towards solutions of these problems.

STANDARDS FOR RENAL DIALYSIS AND TRANSPLANT

A recently appointed Ad Hoc Committee is developing Standards for Renal Dialysis and Transplantation and is anxious to hear the views of interested parties.

The group is planning to develop guidelines for medical ethics in this field as well. Also included will be consideration of locations for centers throughout the State where such Dialysis and Transplantation can best be performed.

Let the Faculty office know of your interest in serving with this Committee.

MEDIC IN FIFTH YEAR

On Friday, September 26, 1969, MEDIC will begin its fifth year of operation. Full programs have been developed and are at the printers. The opening session

MEDIC IN FIFTH YEAR (cont'd)

will be on Uses and Abuses of Antibiotics, presented by Patricia Charache, MD, Assistant Professor of Medicine, The Johns Hopkins University School of Medicine, and will originate at Frederick Memorial Hospital, where the system was first initiated.

NEW FACULTY PUBLICATION

In the course of preparation is a booklet which will combine various Faculty opinions, Guidelines, Regulations and Laws of Maryland with which physicians should be familiar; and in some cases, must comply.

Copies will be mailed to all Faculty members when it is available. Additional copies will be available in limited quantities on individual request.

RUBELLA VACCINE

Guidelines for the use of Rubella Vaccine have been jointly developed with the Faculty's Immunization Subcommittee and the State Health Department.

Copies have been mailed to all Faculty members. Physicians are urged to read these principles carefully and evaluate their application to their patients.

HERSHEY MEETING

While the Hershey Hotel is more than half-filled, it is still not too late to make your reservations for a fun-filled weekend at the time of the Semiannual Session.

Reservation blanks for the various activities, including the Golf Tournament for Men and Ladies, will be mailed shortly.

GOVERNOR'S HEALTH CONFERENCE

Russell S. Fisher, MD, Faculty President; John F. Schaefer, MD, Council Chairman; Henry A. Briele, MD President-elect; and Mr. John Sargeant were all in attendance at the Governor's Health Conference held in June.

The first of its kind in Maryland (and we understand in the Nation) prime attention was given to the health manpower shortage and methods of delivery of health care services.

It was chaired by the newly appointed Secretary of Health and Mental Hygiene, Neil Solomon, MD.

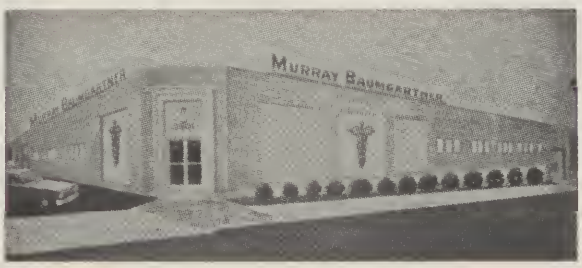
Featherlite
Contour-Shaped
Surgical Two-Way



SEAMLESS ELASTIC HOSIERY

Now! . . . a new concept in elastic hosiery achieves excellent cosmetic effect and provides the necessary therapeutic qualities of surgical weight. Using a patented inlay method to insure proper lateral support, fine gauge nylon-covered rubber thread is knitted with MAGILOFT (stretch nylon) yarn to produce a lightweight elastic two-way stretch stocking highly resistant to runs and snags.

For the FIRST time in this field, both STOCK and SPECIALS are available; thus you may offer your patients complete selection of elastic two-way stretch stockings with proper compression, regardless of size or shape.

The Contour-Shape, combined with a MAGILOFT SOFT TOP and knitted-in heel, has eliminated wrinkles at ankle and all tendency to slip down at the top.

The SUPPORT of surgical weight is retained with the advantages of light weight, and all the desirable features of fine gage hosiery.

The AMBAR® SCRAPBOOK of Obesity Oddities
FACT & LEGEND

CONTROL FOOD AND MOOD ALL DAY LONG WITH A SINGLE MORNING DOSE

AMBAR #2 EXTENTABS®

methamphetamine HCl 15 mg., phenobarbital 64.8 mg. (1 gr.) (Warning: may be habit forming).

One Ambar Extentab before breakfast can help control most patients' appetite for up to 12 hours. Methamphetamine, the appetite suppressant, gently elevates mood and helps overcome dieting frustrations. Phenobarbital, the sedative in Ambar, controls irritability and anxiety...helps maintain a state of mental calm and equanimity. Both work together to ease the tensions that erode the willpower during periods of dieting.

Also available: Ambar #1 Extentabs®—methamphetamine hydrochloride 10 mg., phenobarbital 64.8 mg. (1 gr.) (Warning: may be habit forming).

BRIEF SUMMARY/**Indications:** Ambar suppresses appetite and helps offset emotional reactions to dieting. **Contraindications:** Hypersensitivity to barbiturates or sympathomimetics; patients with advanced renal or hepatic disease. **Precautions:** Administer with caution in the presence of cardiovascular disease or hypertension. **Side Effects:** Nervousness or excitement occasionally noted, but usually infrequent at recommended dosages. Slight drowsiness has been reported rarely. See package insert for further details.

A. H. ROBINS COMPANY, RICHMOND, VA. 23220 A·H·ROBINS

SCIENTIFIC EXHIBITS

The scientific exhibits are an integral part of the Annual Meeting of the Medical and Chirurgical Faculty. All physicians who have a scientific exhibit are urged to fill in the application below for the next Annual Meeting, which will be held

APRIL 1, 2, 3, 1970

The Alcazar, Baltimore

As space is limited, it is suggested that applications be submitted as soon as possible.

RULES GOVERNING SCIENTIFIC EXHIBITS

The following rules govern the selection and conduct of scientific exhibits:

1. Each exhibitor shall be fully responsible for the content, arrangement, presentation, setting up, and dismantling of his exhibit.
2. Cost of transportation of exhibit to and from the meeting must be borne by the exhibitor.
3. The Medical and Chirurgical Faculty will provide, without cost to the exhibitor, a backdrop and side rails for the booth, and 1000 watt electric current outlets.
4. MOTION AND SOUND MAY BE USED ONLY IF THEY DO NOT DETRACT FROM OTHER EXHIBITS, DISTURB THOSE IN ROOM, OR INTERFERE WITH TELEPHONES.
5. No reference to, or credit for, financial aid shall be shown on the exhibit.
6. Only generic names may be used, and shall not exceed one inch in height. NO TRADE NAMES are permissible.
7. Each exhibit should be manned at all times by someone thoroughly familiar with its content.
8. Exhibitors are urged to discuss their displays and work with the physicians and students.
9. The Medical and Chirurgical Faculty reserves the right to approve or reject any exhibit without recourse.

APPLICATION FOR SCIENTIFIC EXHIBIT SPACE

Fill in and mail to: Chairman, Exhibit Subcommittee
Medical and Chirurgical Faculty
1211 Cathedral Street, Baltimore, Md. 21201

1. Title of exhibit: _____

_____

2. Please attach a 50-100 word description of the exhibit: _____

3. Give amount of space required, depth, width, and height: _____

If exhibit has side panels, are depth and width included above? _____

If not, what additional space is required? _____

4. Electrical or other requirements: _____

_____

5. Has exhibit been shown at other medical meetings? _____

_____

6. Name and title of exhibitor: _____

_____

7. Name of institution cooperating in the exhibit: _____

_____

8. Address of exhibitor: _____

_____

SEE RULES GOVERNING SCIENTIFIC EXHIBITS

Computer Monitoring of Expectant Mothers

A small computer is now being used in the Lying-In Hospital of the University of Chicago hospitals and clinics in a preliminary study to monitor the condition of expectant mothers where probable complications are indicated.

The computer can maintain a constant vigil over the patient and analyze and display its observations. Subtle patho-physiologic deviations from normal labor can now be more easily interpreted by the obstetrician. The computer, called LINC-8, samples incoming signals from electrodes attached to the patient and produces a visual screen display showing: 1) the uterine pressure curve, 2) a graphic representation of the contraction's normality, 3) the interval between the last two contractions, and 4) the amplitude of the last contraction and the work done by that contraction. The computer display is sent via closed circuit television to the patient's room for the obstetrician to study.

—The lowest priced tetracycline—nystatin combination available—

Treating vaginitis is as easy as AVC

Trichomonads...Monilia...Bacteria

You can depend on AVC—the comprehensive therapy that acts against all three major vaginal pathogens.

Monilia emerging as a major therapeutic problem—
recent studies report increased incidence, attributed in part to the use of oral contraceptives,[1-4] broad-spectrum antibiotics[5-9] and prolonged use of corticosteroids.[7]
recent evidence establishes high rate of microbiological and clinical cure with AVC.[9-11]

Comprehensive — Effective

The published record and more than two decades of clinical experience clearly establish the therapeutic value of AVC in vaginitis/cervicitis and vaginal surgery.

Easy as AVC

Contraindications: Known sensitivity to sulfonamides.
Precautions/Side Effects: The usual precautions for topical and systemic sulfanamides should be observed because of the passibility of absarption. Burning, increased local discomfort, skin rash or other manifestations of sulfanamide toxicity are reasons to discontinue treatment.
Dosage: One applicatarful or one suppasitary intravaginally once or twice daily.
Supplied: Cream—Four-ounce tube with or without applicator. Suppasitaries—Box of 12 with applicator.

new Orenzyme® Bitabs

One tablet q.i.d.

Trypsin: 100,000 N.F. Units, Chymotrypsin: 8,000 N.F. Units.; equivalent in tryptic activity to 40 mg. of N.F. trypsin

DOUBLE STRENGTH

Proteolytic enzyme therapy specifically indicated for the rapid resolution of inflammation and edema as adjunctive therapy in accidental and surgical trauma.

1 tablet q.i.d. provides recommended therapeutic dose at lower cost.

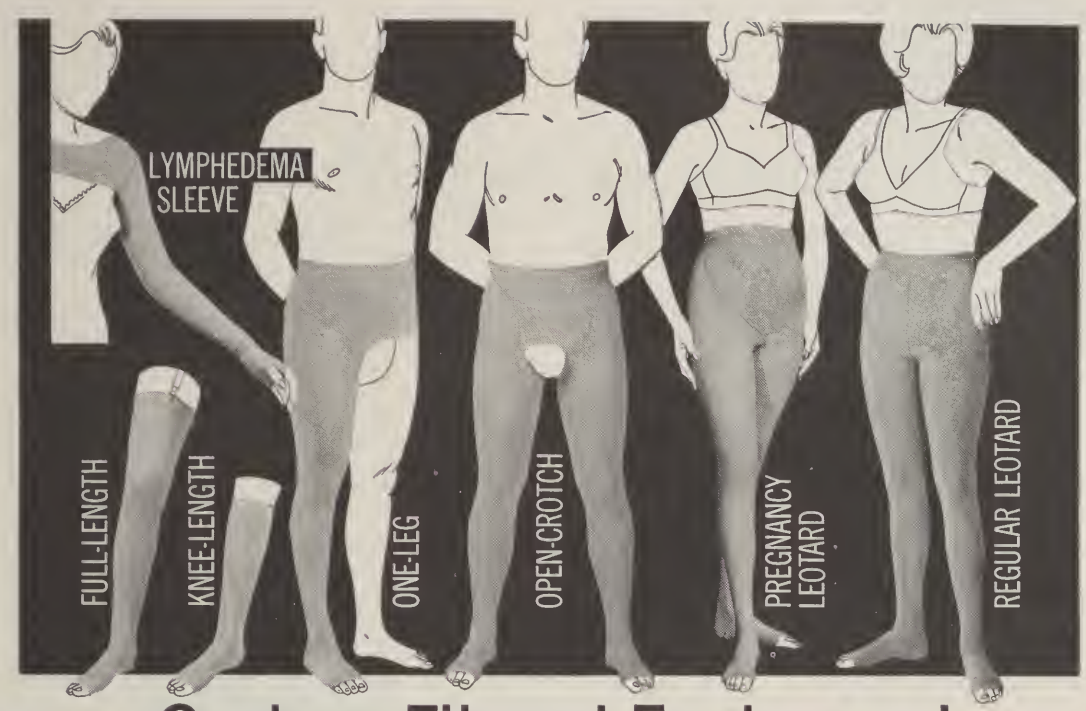
Description: ORENZYME BITABS offers the theropeutic effects of trypsin in an oral form as adjunctive therapy for the rapid resolution of inflammation and edema. ORENZYME BITABS is convenient to use, promotes patient cooperation and is ideally suited for maintenance therapy following parenteral trypsin.

Indications: When used as adjunctive therapy for the rapid resolution of inflammation and edema, good results have been obtained in:

- ☐ Accidental Trauma
- ☐ Postoperative Tissue Reactions.

Other conventional measures of treatment should be used as indicated. In infection, appropriate anti-infective therapy should be given.

Contraindications: ORENZYME BITABS should not be given to patients with a known sensitivity to trypsin or chymotrypsin.



Precautions: It should be used with caution in patients with abnormality of the blood clotting mechanism such as hemophilia, or with severe hepatic or renal disease. Safe use in pregnancy has not been established.

Adverse Reactions: Adverse reactions with ORENZYME have been reported infrequently. Reports include allergic manifestations (rash, urticaria, itching), gastrointestinal upset and increased speed of dissolution of animal-origin surgical sutures. There have been isolated reports of anaphylactic shock, albuminuria and hematuria. Increased tendency to bleed has also been reported but, in controlled studies, it has been seen with equal incidence in placebo-treated groups. (See Precautions.) It is recommended that if side effects occur medication be discontinued.

Dosage: One tablet q.i.d.

TRADEMARK: BITABS U.S. PATENT NO. 3,004,893 4/69 0-821A

Custom-Fit, and Engineered For Your Individual Patient

Jobst Venous Pressure Gradient® supports are custom-made and precisely fitted to the contour of the affected extremity of the individual patient in a series of careful measurements.

Even more *important* than the perfect fit, are the exact counterpressures built-in according to your own prescription!

Jobst Venous Pressure Gradient® elastic stockings are a treatment of *choice* for leg ulcers, varicose veins, stasis dermatitis, postmastectomy lymphedema, post-phlebitis syndrome, post-fracture, post-operative and injury edema.

For full information, have your secretary mail the coupon below. Or just call the number shown. You will find out why we named them "Service" Centers.

Booklet on Drug Abuse

"In the final analysis, playing games with the truth has historically been demonstrated to be a mistake."

These are the words of a psychologist at the National Institute of Mental Health in Washington, speaking about the need to communicate honestly with young people on the use of drugs. This statement also provides the basis for a 48-page book on drug abuse published by the National Association of Blue Shield Plans. It is offered free by most Blue Shield Plans throughout the United States.

Drug Abuse: The Chemical Cop-Out is primarily aimed at dispelling the romantic illusions of drugs, and separating the facts from the myths for both adults and young people. While authorities generally agree that most people suffer from misinformation, they also concede that parents are perhaps more lacking in knowledge about drugs than their teenagers. John Finlator, associate director of the Federal Bureau of Narcotics and Dangerous Drugs, states, "There is one thing I think we are all missing the boat on. That is, we, who are in authority, find ourselves pretty ignorant about the drug problem around us. The school teacher, the parent, the school administrator, the businessman, and the housewife are all ignorant about the problem. Thus, when a young person starts talking about drugs, neither his parents nor his teachers are really able to keep up with him. If we are going to solve the drug problem, we must do so through an effective educational process, and one that can be accepted."

The four-color booklet features many photographs taken during the filming of three television specials on drug abuse being sponsored on television stations by local Blue Shield Plans. The three films are narrated by Robert Mitchum, Paul Newman, and Rod Steiger respectively.

In addition to providing a comprehensive description of popular drugs being abused, *Chemical Cop-Out* explains many of the physical and psychological effects of such drugs as marijuana, the amphetamines, LSD, mescaline, and others. It also explores some of the sociological and psychological reasons for abusing drugs and how society is reacting to the use of chemicals as a means for escape. In the booklet, Dr. Robert Petersen of the National Institute of Mental Health observes: "Parents are frightened, and you can certainly understand why they are concerned, if for no other reason than they tend to believe the notion that a joint of marijuana is the first step to becoming a hopeless junkie, or something of this sort, to the very realistic dangers of the kid getting arrested."

Dr. Alfred Freedman of the New York Medical College comments on one unfortunate aspect of youth's involvement with drugs.

"It's not so much the physical dangers of drugs, which do exist, or that they (the users) will become criminally insane, which is ridiculous, but rather it's the fact that they are developing an inward reality that is most meaningful to them, rather than maintaining a concern with society in general. We are in very difficult times, it seems to me, and the participation of everyone, particularly the younger people, is extremely important. If the focus of their lives becomes centered upon drugs, which often happens, then I think we are losing something."

The booklet also explores the distribution system of drugs including highly profitable heroin and somewhat less lucrative, but nonetheless popular, marijuana. For example, it is pointed out that a kilo of marijuana, which starts out selling for $2, may wind up bringing as much as $500.

Methods for treating hard drug addicts are also explored. The work at various research and therapeutic centers, including the federally-operated hospital in Lexington, Kentucky, and Daytop Village in New York city are discussed.

Concluding chapters present realistic insight into the problem by prominent men in the fields of law enforcement, medicine, and psychology. It is pointed out that society must take the initiative in seeking to change those factors in the environment which are conducive to using drugs as a means for escape.

For copies of the booklet, contact your local Blue Shield office.

"Shall I order Maalox?"

"Yes. Patients respond well to it, and seem to take it more faithfully."

Works well · Doesn't constipate · Tastes good · Economical

Supplied: Maalox Suspension (12 fl. oz.). *Also available:* Maalox No. 1 Tablets (0.4 Gm.) : no sugar, low sodium content. Maalox No. 2 Tablets (0.8 Gm.) : double strength for double antacid action.

HIGHLAND HOSPITAL

Asheville, North Carolina
Founded 1904
A DIVISION OF THE DEPARTMENT OF PSYCHIATRY OF DUKE UNIVERSITY
Accredited by the Joint Commission on Accreditation and Certified for Medicare

Complete facilities for evaluation and intensive treatment of psychiatric patients, including individual psychotherapy, group therapy, psychodrama, electro-convulsive therapy, Indoklon convulsive therapy, drugs, social services work with families, family therapy, and an extensive and well organized activities program, including occupational therapy, art therapy, athletic activities and games, recreational aotivities and outings. The treatment program of each patient is carefully supervised in order that the therapeutic needs of each patient may be realized.
High school facilities for a limited number of appropriate patients are now available on grounds. The School Program is fully integrated into the hospital treatment program and is accredited through the Asheville School System.
Complete modern facilities with 85 acres of landscaped and wooded grounds in the city of Asheville.

The burdened heart...

The burdened heart, psychic tension, and adjunctive therapy with Valium® (diazepam):

Before prescribing, please consult complete product information, a summary of which follows:

Indications: Tension and anxiety states; somatic complaints which are concomitants of emotional factors; psychoneurotic states manifested by tension, anxiety, apprehension, fatigue, depressive symptoms or agitation; acute agitation, tremor, delirium tremens and hallucinosis due to acute alcohol withdrawal; adjunctively in skeletal muscle spasm due to reflex spasm to local pathology, spasticity caused by upper motor neuron disorders, athetosis, stiff-man syndrome, convulsive disorders (not for sole therapy).

Contraindicated: Known hypersensitivity to the drug. Children under 6 months of age. Acute narrow angle glaucoma.

Warnings: Not of value in psychotic patients. Caution against hazardous occupations requiring complete mental alertness. When used adjunctively in convulsive disorders, possibility of increase in frequency and/or severity of grand mal seizures may require increased dosage of standard anticonvulsant medication; abrupt withdrawal may be associated with temporary increase in frequency and/or severity of seizures. Advise against simultaneous ingestion of alcohol and other CNS depressants. Withdrawal symptoms have occurred following abrupt discontinuance. Keep addiction-prone individuals under careful surveillance because of their predisposition to habituation and dependence. In pregnancy, lactation or women of childbearing age, weigh potential benefit against possible hazard.

Precautions: If combined with other psychotropics or anticonvulsants, consider carefully pharmacology of agents employed. Usual precautions indicated in patients severely depressed, or with latent depression, or with suicidal tendencies. Observe usual precautions in impaired renal or hepatic function. Limit dosage to smallest effective amount in elderly and debilitated to preclude ataxia or oversedation.

Side Effects: Drowsiness, confusion, diplopia, hypotension, changes in libido, nausea, fatigue, depression, dysarthria, jaundice, skin rash, ataxia, constipation, headache, incontinence, changes in salivation, slurred speech, tremor, vertigo, urinary retention, blurred vision. Paradoxical reactions such as acute hyperexcited states, anxiety, hallucinations, increased muscle spasticity, insomnia, rage, sleep disturbances, stimulation, have been reported; should these occur, discontinue drug. Isolated reports of neutropenia, jaundice; periodic blood counts and liver function tests advisable during long-term therapy.

Nutley, New Jersey 07110

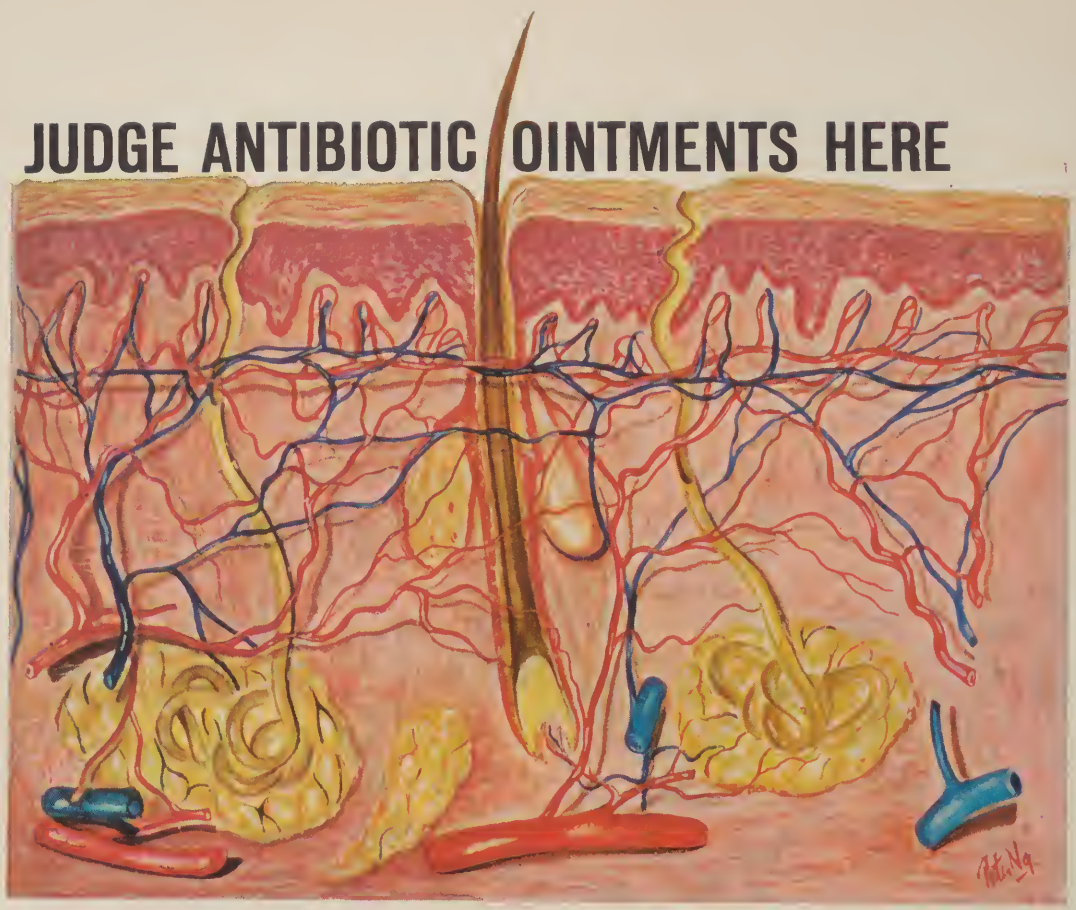
Artist's conception schematically showing varying ischemic ventricular muscle tissue.

To help lift psychic tension from the already burdened heart

When the cardiac patient shows signs of panic-like reactions following initial diagnosis—a daily regimen of 10-mg Valium (diazepam) tablets *t.i.d.* or *q.i.d.* can help control *severe* psychic tension, anxiety, apprehension and agitation. For *less severe* emotional stress, the 5-mg tablet usually provides the desired calming effect.

When the cardiac patient's outlook impedes convalescence—Valium, as it relieves psychic tension, can help the patient regain a realistic perspective... help him deal more rationally with convalescence by countering excessively anxious attitudes towards the future.

When the cardiac patient can't adjust emotionally to post-recovery limitations—Valium, through its prompt and pronounced calming action on psychic tension, may help avoid exacerbation or aggravation of cardiac symptoms.



On proper maintenance dosage, Valium seldom dulls the senses or interferes with functioning.

Should anxiety-induced insomnia be a problem— an *h.s.* dose added to the *t.i.d.* schedule usually helps permit a night of restful sleep.

Valium®
(diazepam)

2-mg, 5-mg and 10-mg tablets
t.i.d. and *h.s.*

JUDGE ANTIBIOTIC OINTMENTS HERE

Results on skin are final proof of any topical antibiotic's effectiveness

No in vitro test can duplicate a clinical situation on living skin. 'Neosporin' (polymyxin B—bacitracin—neomycin) Ointment has consistently proven its effectiveness in thousands of cases of bacterial skin infection. The spectra of the three antibiotics overlap in such a way as to provide bactericidal action against most pathogenic bacteria likely to be found topically. Diffusion of the antibiotics from the special petrolatum base is rapid since they are insoluble in the petrolatum, but readily soluble in tissue fluids. The Ointment is bland and nonirritating.

Caution: As with other antibiotic preparations, prolonged use may result in overgrowth of nonsusceptible organisms and/or fungi. Appropriate measures should be taken if this occurs. Articles in the current medical literature indicate an increase in the prevalence of persons allergic to neomycin. The possibility of such a reaction should be borne in mind.

Contraindications: This product is contraindicated in those individuals who have shown hypersensitivity to any of its components.

Supplied: Tubes of 1 oz., ½ oz. with applicator tip, and ⅛ oz. with ophthalmic tip.

Complete literature available on request from Professional Services Dept. PML.

'NEOSPORIN'®

brand

POLYMYXIN B-BACITRACIN-NEOMYCIN OINTMENT

BURROUGHS WELLCOME & CO. (U.S.A.) INC., Tuckahoe, N.Y.

a broad-spectrum antibiotic for the diabetic:

threat or therapy?

Disordered metabolism makes her prone to bacterial infection —and to moniliasis.

When she needs tetracycline, she may also need protection against the threat of fungal overgrowth. And Tetrex-F can provide both.

Each capsule contains 250 mg. of tetracycline phosphate complex to control sensitive bacterial pathogens...and nystatin, 250,000 units, as a precautionary measure against troublesome vaginitis, proctitis or other monilial infections. However, superinfection with other, nonsusceptible organisms may occur.

Tetrex-F®
(tetracycline phosphate complex-nystatin)

PRESCRIBING INFORMATION: Tet-F. 5—2/23/67. For complete information consult Official Package Circular.
Indications: Infections of respiratory, gastrointestinal and genitourinary tracts and skin and soft tissues due to tetracycline-sensitive organisms, in patients with increased susceptibility to monilial infections.
Contraindications: The drug is contraindicated in patients hypersensitive to its components.
Warnings: Photodynamic reactions have been produced by tetracyclines. Natural and artificial sunlight should be avoided during therapy. Stop treatment if skin discomfort occurs. With renal impairment, systemic accumulation and hepatotoxicity may occur. In this situation, lower doses should be used. Tooth staining and enamel hypoplasia may be induced during tooth development (last trimester of pregnancy, neonatal period and childhood).
Precautions: Bacterial superinfections may occur. Infants may develop increased intracranial pressure with bulging fontanels. In gonorrheal therapy, serologic tests for syphilis should be conducted initially and monthly for 3 months.
Adverse Reactions: Glossitis, stomatitis, nausea, diarrhea, flatulence, proctitis, vaginitis, dermatitis, and allergic reactions may occur.
Usual Adult Dosage: 1 capsule q.i.d. Continue for 10 days in Beta-hemolytic streptococcal infections. Administer one hour before or two hours after meals.
Supplied: Capsules, bottles of 16 and 100. Each capsule contains tetracycline phosphate complex equivalent to 250 mg. tetracycline HCl activity and 250,000 units of nystatin.

For Oral Suspension, 125 mg. tetracycline and 125,000 u. nystatin/5 ml., 60 ml. bottles. **A.H.F.S. Category 8:12**

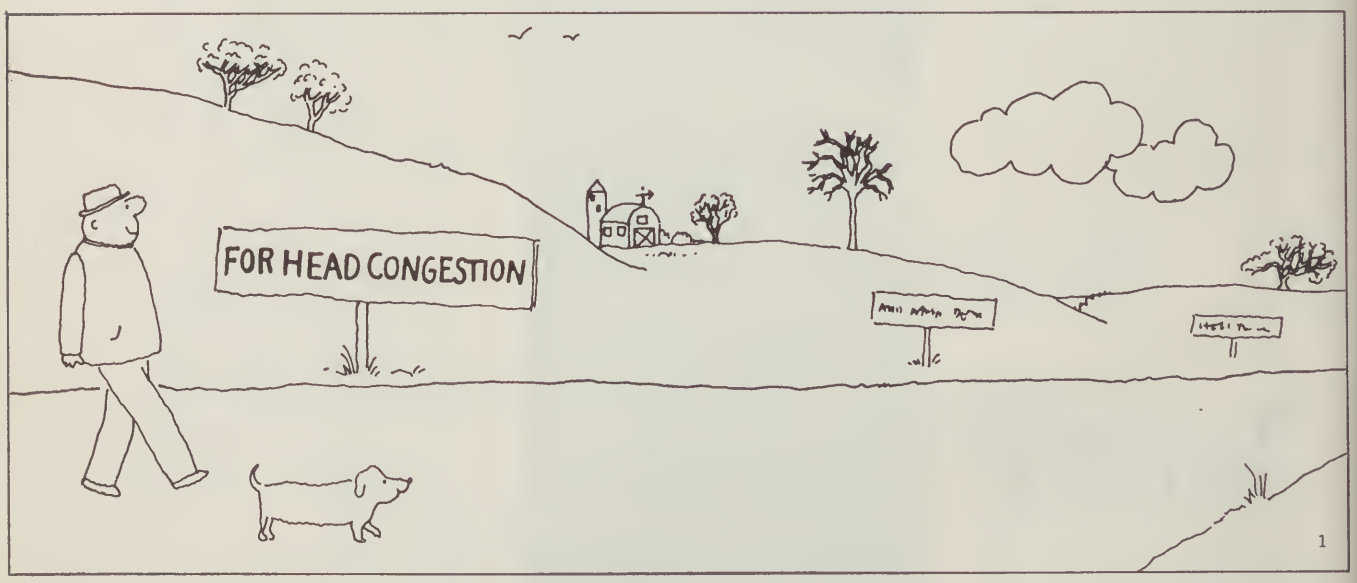
Syracuse, New York 13201

Pharmacy School Shows Dangers of Drug Abuse

"The pharmacist is in the best position to counsel the general public on the dangers of drug abuse," says David A. Blake, MD, "and the School of Pharmacy should be a resource for educational programs geared to that end."

Dr. Blake, assistant professor of pharmacology, is actively engaged in making such an educational program a reality.

Movies showing the effects of drugs on animals will be incorporated into the lecture presentation Dr. Blake designed for high school showing. Eventually there will be five films dealing with the effects of the five different classes of drugs.



The idea is to provide a graphic representation of the dangers, both emotional and physical, involved in nonmedical drug experimentation.

Since last year Dr. Blake has been presenting drug-abuse programs at area high schools with the aid of Dr. C. T. Ichniowski, professor and head of the department of pharmacology, and pharmacy student volunteers.

The films are the first step in creating a new role for the pharmacy school, that of a drug information center. In addition to the films, the school hopes to be able to provide lecture outlines, slides, and refresher courses for pharmacists, to equip them with the most up-to-date information on the dangers of drug abuse.

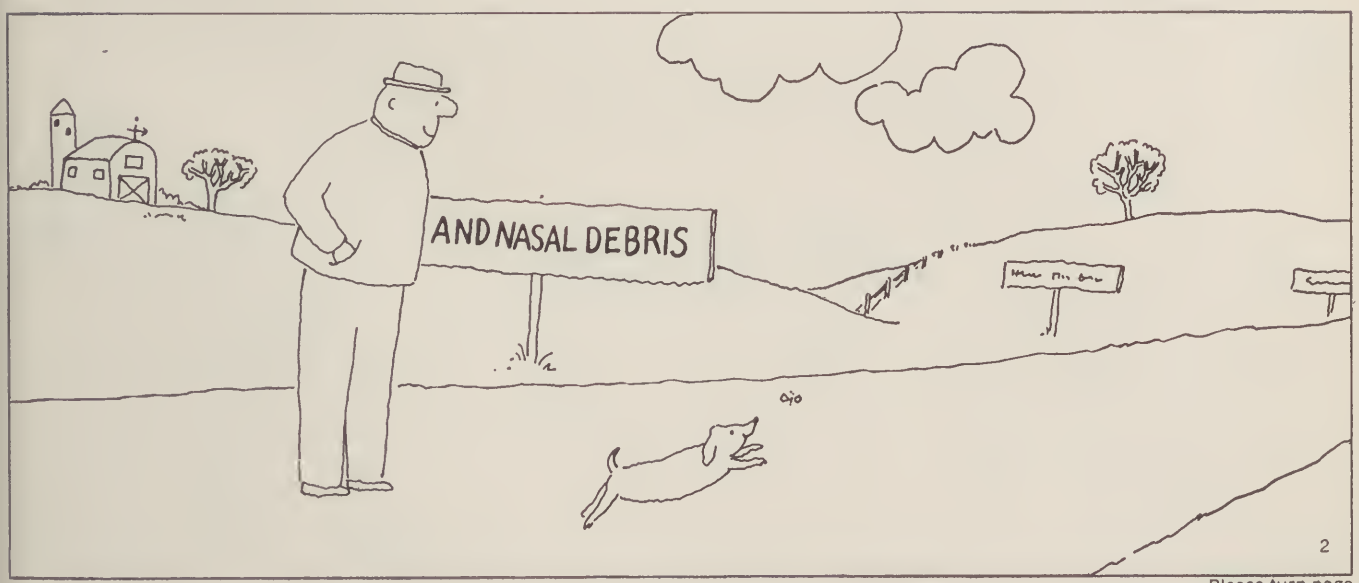
"In this way the community pharmacist can expand his role as counselor to the public," Dr. Blake stated.

Advertisement

THE MONTH

IN WASHINGTON

The American Medical Association has offered to cooperate in a Senate investigation of large medicare and medicaid payments to physicians and other health practitioners.



The offer followed a Senate speech by Sen. John J. Williams, (R., Del.), in which he reported that the staff of the Senate Finance Committee had found that several thousand doctors, dentists, and others had received $25,000 or more for their services under the two government programs in 1968.

In a second Senate speech, Williams expressed appreciation for the AMA offer to cooperate.

"This is the type of cooperation we need, and I appreciate this support from the American Medical Association," Williams told the Senate. "I sincerely hope that we shall have similar pledges of support from representatives of the other groups affected.

"I can assure each of these groups that our study will not result in a blanket indictment against any segment of the industry involved. We fully recognize that the overwhelming percentage of those who are in any way connected or working with this program are trying to do a good job; however, when instances of exploitation or excessive charges are discovered they must be exposed and properly dealt with."

Williams, who has announced he will not seek re-election next year, is a member of the Senate Finance Committee which is making an extensive study of the operation of medicaid and medicare.

Please turn page

Williams said that, although a staff report would not be ready until later this summer, the committee's investigation already had shown:

"First, in 1968 the medicare program paid $25,000 or more to each of at least 5,000 physicians.

"Second, thousands of health practitioners—doctors, dentists, optometrists, and others—were each paid $25,000 or more under the welfare health care programs in 1968. . . . A surprising note is the large number of dentists appearing on the lists from welfare agencies. . . .

"Data has also been gathered, and detailed tables prepared, comparing the average medicare payments for the most common surgical procedures for older people with the maximum payments allowed under the most widely held Blue Shield contract in the same geographical area.

"The results are startling. Medicare's average payments run as much as two to four times as high as Blue Shield maximums. For example, in two areas of the country, medicare's average payment for a cataract operation is more than four times as much as the Blue Shield allowance. These are not isolated cases. There is a pronounced pattern of inflated payments by medicare.

"The report to the committee will include pinpointing the causes underlying these extremely generous handouts of public funds.

"Another unusual situation has occurred in Social Security's pressing carriers to pay for so-called supervisory services rendered by a teaching physician, even though the actual care is provided by an intern or resident. Before medicare, virtually no insurer paid for such services. . . .

"The investigation has expanded the evaluation of carrier and intermediary performance to determine whether the Government is getting what it is certainly paying for, and the extent to which intermediaries and carriers are carrying out specific functions assigned to them by the medicare statute.

"Thus far, a wide variance and level of performance has been observed. . . .

"The law requires intermediaries and carriers to exercise effective controls on utilization of services. . . .

"Yet some carriers and intermediaries appear virtually to ignore performance of this vital function while others seem to be doing a reasonably effective job."

Following Williams' first speech, the AMA issued a statement saying that it shared with the Senator a concern over the rising costs of medicare and medicaid. The Association offered to cooperate with the Senate Finance Committee or any other congressional committee studying the problem of rising health care costs. The AMA earlier had made the same offer to Health, Education and Welfare Secretary Robert H. Finch.

The AMA statement said:

"For some time the AMA has been giving national leadership in coordinating the efforts of state and county medical societies in the establishment and effective functioning of local review and utilization committees checking on the health care services rendered under the medicare and medicaid programs. Close liaison also has been established between carriers and

many medical societies in reviewing disbursements under the government programs.

"All investigations so far have indicated that an overwhelming majority of physicians, participating in medicare and medicaid, are charging reasonable fees. The charges of only about 2% of the physicians receiving payments from the programs have been challenged. Of course, the AMA favors appropriate action in any of the cases where physicians are found to receive improper payments. Last June, the AMA Board of Trustees urged all state and local medical societies 'to act swiftly and firmly in all instances of known exploitation, and excessive charges for health care that may occur in their jurisdiction.' In 1967, the AMA said 'any reports of abuses by physicians or by any other health care program should be thoroughly and promptly investigated and action taken where indicated.' Several medical societies have expelled members where it has been proved that a physician's charges were excessive or he in some other way exploited the program.

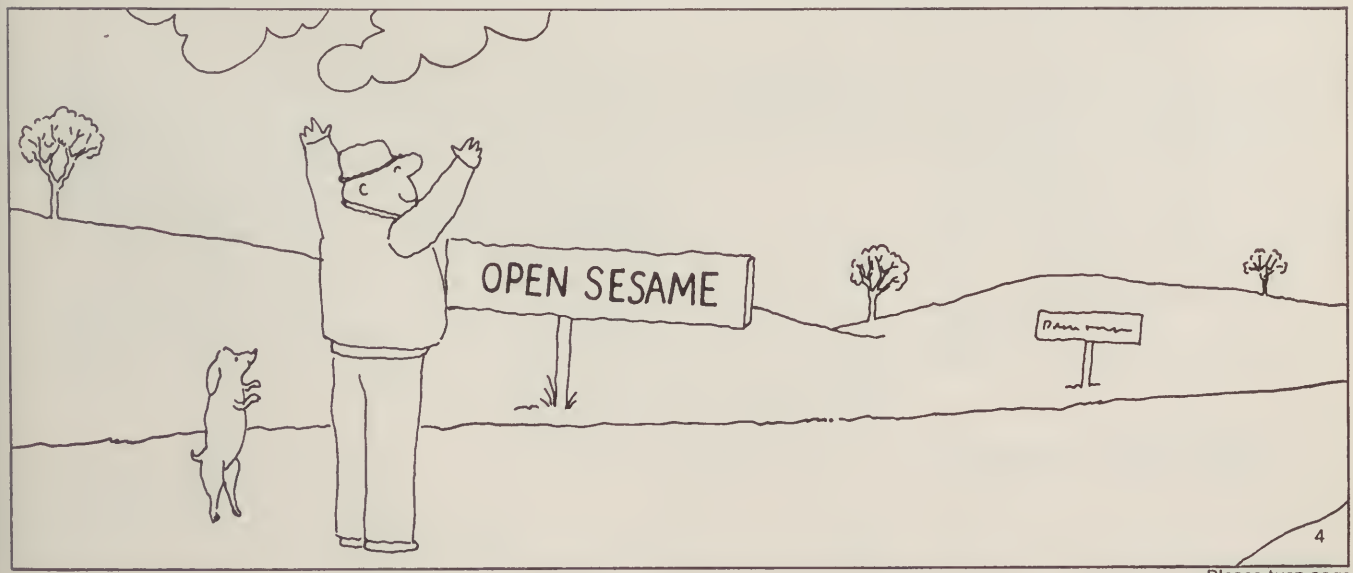
"The AMA, through its publications and speeches by its officials, has been emphasizing to physicians the responsibility they have to hold down the health care costs of their patients both under and outside government programs. In an April 17 letter to Finch, Dr. Wilbur said the AMA 'is eager to make available to your office the composite experience and judgment of the nation's physicians, who are the principal providers of health care to all the people.'

" 'The knowledge and judgment of the nation's physicians—as well as of the prepayment plans, health insurance industry, hospitals, the allied health professions, the actuaries and others—must be enlisted in your battle against the health-care portion of the inflation problem,' Dr. Wilbur said."

* * *

The House passed and sent to the Senate a three-year $937 million extension of the Hill-Burton Act under which the federal government has helped finance construction of hospitals and nursing homes with 425,000 beds.

Members approved the measure on a 351 to 0 roll call after turning down a series of amendments designed to channel more of the matching hospital grants to big cities than urban areas, and into modernization rather than new hospital construction.



In addition to extending existing aid, the bill provides new loan guarantees, as requested by the Nixon Administration, and interest subsidies, which the Administration opposed.

The bill, as passed, authorizes appropriations (over three years) up to $405 million for hospital construction; $165 million for modernization; and $300 million in guaranteed loans, toward which the government would contribute up to $37 million in 3% interest subsidies. In addition, grants up to $30 million could be made for emergency room modernization.

* * *

The American Medical Association urged that Congress approve full appropriations for medical education programs.

C. H. William Ruhe, MD, director of the AMA's Division of Medical Education, testified be-

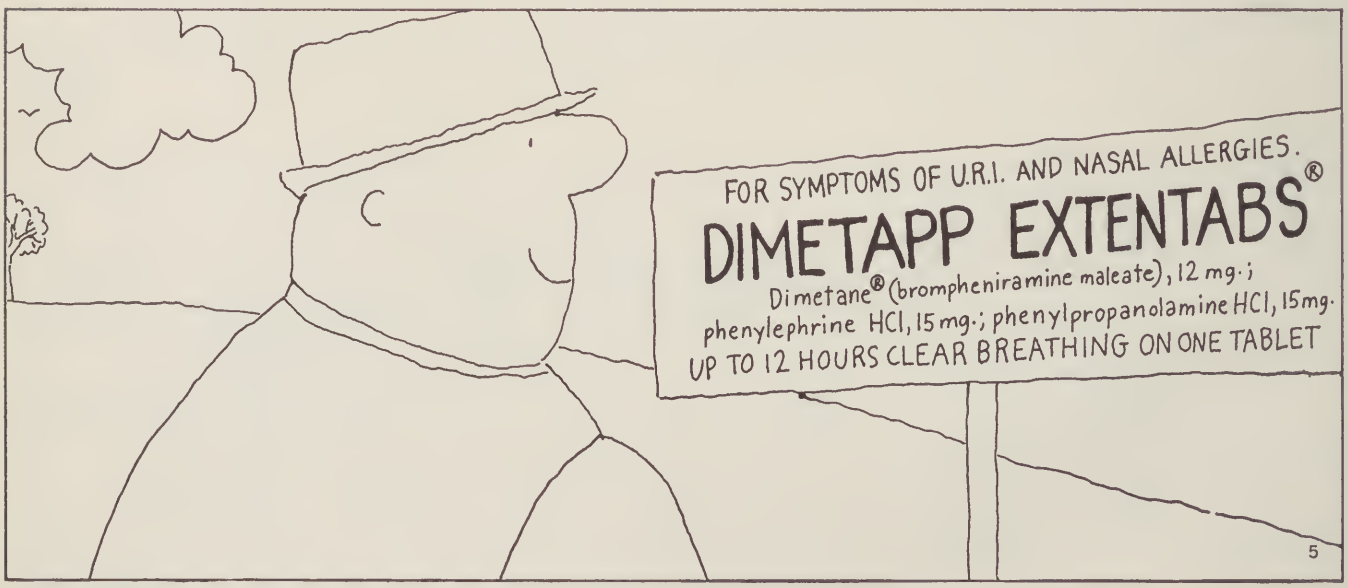
Please turn page

fore a House appropriations subcommittee that the nation's urgent need for more physicians could "only be met effectively by a major increase in the capacity of American medical schools to educate more physicians.

"It is, therefore, appropriate to emphasize again that full funding, in the amounts authorized by the Health Manpower Act of 1968, is necessary to permit the construction of new and expanded facilities before major enrollment increases will be feasible," Dr. Ruhe said.

In a letter to the House Public Health and Welfare Subcommittee, the AMA also supported extension of the Medical Library Assistance Act. **Ernest B. Howard, MD,** AMA executive vice-president, said that "we cannot exaggerate the importance to the health professions and the public they serve" of the many beneficial services supported through the programs.

* * *



President Nixon created the cabinet-level Environmental Quality Council to begin a major attack on pollution of the environment. He also named a companion 15-member Citizens' Advisory Committee on the recommendations of Lee A. Dubridge, PhD, his chief science adviser.

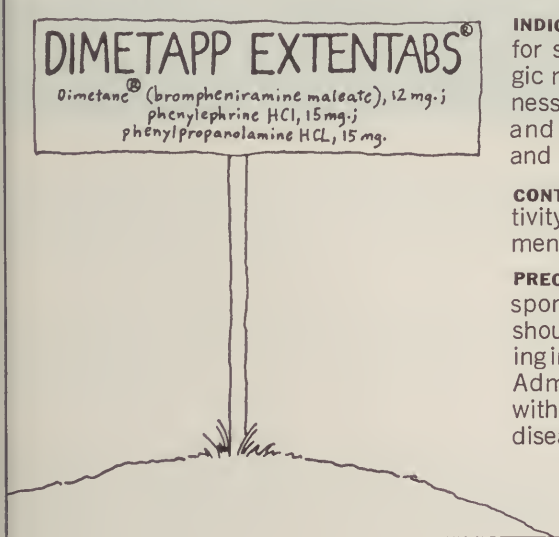
The President said the council, serving as an advisory board on a par with the National Security Council and the Urban Affairs Council, "will provide the focal point for this Administration's efforts to protect all of our natural resources."

Dubridge stated that "the problem is how we can make maximum use of our environment . . . without despoiling it." He said the council would move promptly on the problems of disposal of waste products—a key factor in deterioration of the environment.

The President will head the council, which also will include the Vice-President, and the Secretaries of Agriculture, Commerce, Health, Education and Welfare, Housing and Urban Development, Interior and Transportation.

Laurence S. Rockfeller, one of the nation's leading conservationists and a key figure in Lady Bird Johnson's National Beautification Campaign, will be chairman of the Citizens' Advisory Committee.

Pamphlet on Leukemias, Lymphomas, and Myelomas Offered



Leukemias, lymphomas, and multiple myelomas are cancers of the blood-forming and lymphoid organs. Because these cancers involve abnormal growth of cells with similar functions and origins, they are considered related.

Symptoms, treatment, and research on these diseases are discussed in a pamphlet, "Leukemias, Lymphomas, and Multiple Myeloma," issued recently by the U. S. Department of Health, Education, and Welfare. It is the latest in a series of pamphlets on cancer prepared for the general public by the National Cancer Institute, NIH.

Encouraging progress has been made in extending the survival of acute leukemia patients, according to the pamphlet. This improvement is due to chemotherapy (treatment with drugs), and the development of better methods of patient care. At present, a number of anticancer drugs can bring about complete remissions (absence of any symptoms of the disease) in patients with acute leukemia; the drugs are particularly useful in childhood leukemia.

Lymphoma and multiple myeloma are responsive to both radiotherapy and drug treatment. To achieve better control of these diseases, physicians and scientists throughout the country have been cooperating in a number of research and planning efforts sponsored by the National Cancer Institute.

Single copies of "Leukemia, Lymphoma, and Multiple Myeloma" (PHS Publication No. 1768) are available without charge from the Department of Health, Education, and Welfare, Washington, D. C. 20402. The pamphlet may be purchased from the Superintendent of Documents, U. S. Government Printing Office, Washington, D. C. 20402 at 10¢ a copy or $5 per 100 copies.

INDICATIONS: Dimetapp is indicated for symptomatic relief of the allergic manifestations of respiratory illnesses, such as the common cold and bronchial asthma, hayfever and conjunctivitis.

CONTRAINDICATIONS: Hypersensitivity to antihistamines. Not recommended for use during pregnancy.

PRECAUTIONS: Until patient's response has been determined, he should be cautioned against engaging in operations requiring alertness. Administer with care to patients with cardiac or peripheral vascular diseases or hypertension.

SIDE EFFECTS: Hypersensitivity reactions including skin rashes, urticaria, hypotension and thrombocytopenia, have been reported on rare occasions. Drowsiness, lassitude, nausea, giddiness, dryness of the mouth, mydriasis, increased irritability or excitement may be encountered.

DOSAGE: 1 Extentab morning and evening.

SUPPLIED: Bottles of 100 and 500.

A-H-ROBINS A. H. ROBINS COMPANY RICHMOND, VIRGINIA 23220

A little Hygroton

chlorthalidone

HY-6674

can work a long diuretic day

ll the way from one daily tablet to the next
o help control edema and hypertension

s prolonged action usually provides smooth, sustained diuretic ffectiveness; real one-a-day dosage, right from the start; convenience nd economy.

Hygroton, chlorthalidone, can cause side effects. And it's contra-ndicated in hypersensitivity to the drug and severe renal and epatic diseases.

Check the prescribing information. It's summarized on the next page.

Geigy

A little Hygroton® can work a long diuretic day

chlorthalidone

Indications: Hypertension and many types of edema involving retention of salt and water.

Contraindications: Hypersensitivity and most cases of severe renal or hepatic diseases.

Warning: With the administration of enteric-coated potassium supplements, which should be used only when adequate dietary supplementation is not practical, the possibility of small-bowel lesions (obstruction, hemorrhage, and perforation) should be kept in mind. Surgery for these lesions has been required frequently and deaths have occurred. Discontinue enteric-coated potassium supplements immediately if abdominal pain, distention, nausea, vomiting, or gastrointestinal bleeding occur.

Use with caution in pregnant women and nursing mothers since the drug may cross the placental barrier and appear in cord blood and since thiazides may appear in breast milk. The drug may result in fetal or neonatal jaundice, thrombocytopenia, and possibly other adverse reactions which have occurred in the adult. When used in women of childbearing age, balance benefits of drug against possible hazards to fetus.

Precautions: Antihypertensive therapy with this drug should always be initiated cautiously in postsympathectomy patients and in patients receiving ganglionic blocking agents, other potent antihypertensive drugs or curare. Reduce dosage of concomitant antihypertensive agents by at least one-half. Because of the possibility of progression of renal damage, periodic determination of the BUN is indicated. Discontinue if the BUN rises or liver dysfunction is aggravated. Hepatic coma may be precipitated.

Electrolyte imbalance, sodium and/or potassium depletion may occur. If potassium depletion should occur during therapy, the drug should be discontinued and potassium supplements given, provided the patient does not have marked oliguria.

Take special care in cirrhosis or severe ischemic heart disease and in patients receiving corticosteroids, ACTH, or digitalis. Salt restriction is not recommended.

Adverse Reactions: Nausea, gastric irritation, vomiting, anorexia, constipation and cramping, dizziness, weakness, restlessness, hyperglycemia, glycosuria, hyperuricemia, headache, muscle cramps, orthostatic hypotension, which may be potentiated when chlorthalidone is combined with barbiturates, narcotics or alcohol, aplastic anemia, leukopenia, thrombocytopenia, agranulocytosis, impotence, dysuria, transient myopia, skin rashes, urticaria, purpura, necrotizing angiitis, acute gout, and pancreatitis when epigastric pain or unexplained G.I. symptoms develop after prolonged administration. Other reactions reported with this class of compounds include: jaundice, xanthopsia, paresthesia, and photosensitization.

Average Dosage: 50 or 100 mg. with breakfast daily or 100 mg. every other day.

Availability: White, single-scored tablets of 100 mg. and aqua tablets of 50 mg., in bottles of 100 and 1000.

ARTHUR E. COCCO, MD
Journal Representative

Baltimore City Medical Society

MEETING NOTES

The Board of Directors of the Baltimore City Medical Society met on May 13, 1969 at 4:30 PM. The meeting was called to order by the President, Raymond C. V. Robinson, MD.

The minutes of the April 1, 1969 meeting were approved.

The first item on the agenda was a financial report by the Treasurer, Emmanuel A. Schimunek, MD. Dr. Schimunek has reviewed and discussed the financial status of the Society with persons knowledgeable in the field of finance, and he presented two proposals to the Board. These were, first, that the treasurer be bonded, and secondly, that the finances of the Society be placed with the trust department of a bank or with an investment firm. It was agreed that a bond for the treasurer should be purchased and that Dr. Schimunek should investigate further the idea of placing the Society's funds with an investment company. This would assure periodic review and updating of the Society's investments, providing a better return on the funds invested.

The subject of collection of fees for laboratory services by physicians had been discussed previously, and it had been proposed that a letter be sent to the Section on Internal Medicine asking its opinion. However, Edward F. Cotter, MD, reported that he had spoken with Gordon Cader, MD, president of the Section on Internal Medicine, and the Section had decided that as long as the physician was allowed to charge a fee for taking laboratory specimens, no further action would be initiated.

The next item on the agenda was a report submitted by Edward F. Cotter, MD, Chairman of the Committee to Study Hospital Privileges. Dr. Cotter submitted for approval a questionnaire designed by his Committee. This questionnaire will be mailed to all city physicians in the fall.

In addition, it was suggested that this type of questionnaire might well be utilized by the Board of Medical Examiners for the computation of similar information on a state-wide basis. This subject will be discussed with the Secretary of the Board.

A copy of the questionnaire with a brief prelude is as follows:

Since there is a shortage of physicians and hospital beds, it is reasonable to question whether both are being utilized most effectively and efficiently for the benefit of the community. The answer to this question can best be obtained by a survey of physicians in Baltimore. This information is necessary before appointing a larger committee to study in more detail and make recommendations to the Board of the Baltimore City Medical Society.

The Committee believes that there can and should be a meaningful exchange of information and services in the area of primary care existing between hospitals and all practicing physicians in the community, especially those physicians in the immediate neighborhood or area of the hospital. Would you express any ideas you may have on this?

The following questionnaire is proposed:

NAME: .....

Office address: .....

Postgraduate education:

The action of the House of Delegates regarding the Report of the Bylaws Committee was then discussed. The report, as originally presented, would have amended the Bylaws of Med-Chi to state that all councilors would be elected on a district basis, without guaranteeing any specific number of councilors to any component society. The Amendment, presented by the Baltimore City Medical Society delegation, proposed that a specific number of councilors should be guaranteed to certain components. After heated debate in the House of Delegates, both the original report and the suggested amendment were referred back to the Bylaws Committee for further study and report at the next meeting of the House.

A list of proposed general meeting dates of the Society for the remainder of 1969 and 1970 were presented and approved by the Board. The dates approved are as follows:

GENERAL MEETINGS 1969 and 1970
Thursday, October 2, 1969, 8:30 PM.
Thursday, November 6, 1969, 8:30 PM.
Thursday, December 4, 1969, 8:30 PM.
Friday, January 2, 1970, 8:30 PM.
(first Thursday is New Year's Day)
Thursday, February 5, 1970, 8:30 PM.
Thursday, March 5, 1970, 8:30 PM.
Thursday, April 9, 1970, 8:30 PM.
(Med-Chi Annual Meeting April 1, 2, 3)
Thursday, October 1, 1970, 8:30 PM.
Thursday, November 5, 1970, 8:30 PM.
Thursday, December 3, 1970, 8:30 PM.

Two of these dates require some explanation. The first Thursday in January is New Year's Day and the first Thursday in April falls on the same date of the Med-Chi Annual Meeting. Therefore, these two meeting dates had to be changed.

The Board agreed to suspend the July and August meetings of the Board of Directors in accordance with past practice. In the event that urgent, pressing matters should arise, a meeting of the Board will be called.

The next item considered by the Board was a discussion of the addition of an extra telephone line to the Baltimore City Medical Society business office. The reason for the suggestion was that the telephone load, incoming and outgoing from the office, has increased tremendously during recent years. The Board unanimously agreed that an extra private line should be installed.

Philip F. Wagley, MD, then presented the proposed Health Sciences Consortium for the approval of the Board. This committee was to help establish scientific courses within the existing community colleges which might be interrelated. The ultimate purpose of this consortium is to broaden the over-all availability for the training of paramedical personnel within the existing facilities. Sanction by the City Medical Society was requested in order to strengthen the application for approval of such a program by federal agencies and to obtain support from the National Institutes of Health. After brief discussion, the Board agreed to lend its support to such a program, however, it was noted that many problems in the organization and delivery of such a concept were obviously forthcoming.

The Board of Directors was asked for help in obtaining payment of delinquent loans offered through the "Student Loan Fund" operated by the Woman's Auxiliary. The Board agreed to write the delinquent physicians a letter urging them to repay the fund in the manner originally agreed upon. If results are not achieved through such a reminder, the Board recommended that national and local medical societies, to which these physicians belong, be informed of this delinquent obligation.

The subject of the disposition of an unfortunate physician with the problem of narcotic addiction was discussed by the Board, but since the physician has voluntarily surrendered his narcotics license and entered a psychiatric institution for therapy, no action was necessary.

The Board was then beset with an arduous task presented by the Baltimore City Health Department to investigate one of the Society's members with regard to an allegedly unsanitary atmosphere in which he practices medicine. The Board decided to write a letter urging "the physician in question" to comply with the standards set by the Baltimore City Health Department.

John B. De Hoff, MD, Director of Local Health Services for the Baltimore City Health Department, requested the Board to recommend means of providing pre-camp and pre-employment physical examinations. Several of the members of the Board were of the opinion that in the past this experience has been extremely unpleasant, and it was agreed to suggest to Dr. De Hoff that these patients, who for the most part are under the age of 18, be referred to the "600 Series Project" within their individual location.

The meeting was adjourned at 6:15 PM.

For elderly patients
in need of a mild tranquilizer
consider **Tybatran®**
brand of tybamate

(When you consult
the Prescribing Information
you may agree
it makes good sense)

PRESCRIBING INFORMATION

Indications: Tybatran (tybamate) has afforded symptomatic improvement in a variety of psychoneurotic disorders, especially in the treatment of the anxiety and tension components of psychoneuroses. Anxiety states manifested somatically have responded to Tybatran (tybamate).

Tybatran (tybamate) has been useful in the control of agitation in the aged and in the alleviation of some of the adverse emotional accompaniments of senility.

Tybatran (tybamate) has been used with benefit in the treatment of depressive symptoms associated with anxiety and other symptoms of psychoneuroses. However, it is not indicated for primary treatment of depressive states. It is not an antipsychotic agent, although it has been used as adjunctive therapy in some psychotic patients.

Dosage: One 350 mg. capsule, 3 times daily and two at bedtime is suggested as the adult starting dose. Adjust to suit individual requirements. Daily doses above 3000 mg. are not recommended.

Contraindications: Known hypersensitivity to tybamate. Since no studies have been done with this drug in human pregnancy, it should not be used in pregnancy unless the potential benefit outweighs the risk.

Warnings: Administer cautiously to patients receiving phenothiazines or other CNS depressants or having history of convulsive seizures (See Adverse Reactions). Consider possibility of additive actions with alcohol or other psychotropic agents, particularly phenothiazines or MAO inhibitors.

Precautions: Avoid abrupt withdrawal after prolonged use, although withdrawal symptoms have not been reported to date. Exercise caution in addiction-prone individuals. If symptoms of hypersensitivity occur, discontinue at once and initiate appropriate symptomatic treatment. Avoid activities requiring optimal mental alertness if drowsiness or vertigo are present. As with any new drug, use cautiously in patients with history of drug allergies, blood dyscrasias, and hepatic or renal disease; periodic measurements of hepatic, hematopoietic and renal function should accompany prolonged and/or high doses.

Adverse Reactions: Most frequent reactions, rarely requiring discontinuation of tybamate, include drowsiness, dizziness, nausea, insomnia, and euphoria. There have been a few reports of skin rash, urticaria, and pruritus. Rare side effects include hyperactivity, fidgetiness, flushing, and tachycardia, suggesting excessive stimulation; also ataxia, unsteadiness, confusion, feeling of unreality, "panic reaction," fatigue, headache, paresthesias, vertigo, gastrointestinal disturbances, glossitis, and dry mouth. Grand mal or petit mal seizures have been reported in a few hospitalized psychotic patients receiving tybamate (up to 6000 mg. daily) together with phenothiazines and other psychotropic agents, but not with tybamate alone. Consider the possibility of rare, serious adverse reactions such as may occur with the related drug, meprobamate. If excessive amounts are ingested, gastric lavage and symptomatic therapy, including central stimulants as necessary, are recommended. Before prescribing, consult package circular.

Supply: Tybatran (tybamate) is available in green, sealed capsules of three strengths: 350 mg., 250 mg., and 125 mg. Each strength is supplied in bottles of 100 and 500.

Dulcolax®...so predictable you can almost set patients by it.

Dulcolax works so effectively that the time of bowel evacuation can often be predicted.

Dulcolax tablets taken at night will usually result in a convenient bowel movement the following morning. Dulcolax suppositories generally work within 15 minutes to an hour.

Dulcolax may be given to the aged, pregnant or nursing women, and children. It may be particularly helpful in conditions in which straining should be avoided. The drug, however, is contraindicated in the acute surgical abdomen.

Dulcolax® bisacodyl

Clues to PVD The geriatric smoker

In studies on peripheral vascular disease—a common by-product of the degenerative aging process—considerable attention has focused on the important role of smoking in the progression of the disease. Although it may not be etiologic, smoking is widely recognized as a prominent contributing factor.[1]

Skin blood flow—significant factor in PVD. Cutaneous digital vasoconstriction caused by nicotine has been observed both in normal subjects and in patients with peripheral vascular disorders.[1,2] Among patients with peripheral vascular disease, however, age and the severity of the disease appear to modify the effects of nicotine. For example, in a study of older patients with *marked* peripheral vascular disease,[3] changes induced by smoking were not statistically significant for the group as a whole. This was explained on the basis of decreased skin reactivity. *Smoking is not permissible in any stage of the disease,* since even "... minimal reduction in blood flow in patients with ischemic limbs may produce a further reduction in tissue nutrition, and thus may be another case of the proverbial straw on the camel's back."[3]

In another study of patients with peripheral vascular disease,[4] the investigators stress that decreased skin blood flow during smoking "... is the factor of most importance to the patient with peripheral vascular disease." *While such patients may adjust to the discomfort of vascular insufficiency in skeletal muscle, decreased skin blood flow may often lead to severe symptomatology.*

More and more physicians have adopted the practice of investigating for peripheral vascular disorder when confronted with a geriatric patient who is a habitual smoker. Once a diagnosis is established, therapeutic measures are directed toward increasing the peripheral circulation and appropriate management of the patient's general medical needs. These include the important safeguards of keeping warm and refraining from smoking.

Professional model posed for illustration.

Important in total management of peripheral vascular disease, vascular spasm or chilblains

Roniacol® Timespan®

(nicotinyl alcohol tartrate)

for relief of ischemic symptoms

Convenience of b.i.d. dosage—sustained-release Timespan Tablets usually provide prolonged relief of ischemic symptoms with two doses daily.
Smoothness of onset—the action of Roniacol (nicotinyl alcohol) is smooth and gradual in onset, rarely causing severe flushing.
Selectivity of action—relaxes the musculature of peripheral blood vessels.
High degree of safety—side effects seldom require discontinuation of therapy.

Before prescribing, please consult complete product information, a summary of which follows:
Indications: Conditions associated with deficient circulation; *e.g.*, peripheral vascular disease, vascular spasm, varicose ulcers, decubital ulcers, chilblains, Meniere's syndrome and vertigo.
Caution: Roche Laboratories endorses caution in the administration of any therapeutic agent to pregnant patients.
Side Effects: Transient flushing, gastric disturbances, minor skin rashes and allergies may occur in some patients, seldom requiring discontinuation of the drug.
Dosage: 1 or 2 Timespan Tablets morning and night.
How Supplied: Timespan Tablets—150 mg nicotinyl alcohol in the form of the tartrate salt, bottles of 50.

"All Registered Nurses are Alike"

It stands to reason. They all go through the same training; they all have to pass the same tests; they all have to measure up to the same standards. Therefore, all registered nurses are alike.

That's nonsense, of course. But it's no more nonsensical than what some people say about aspirin. Namely: since all aspirin is at least supposed to come up to certain required standards, then all aspirin tablets must be alike.

Bayer's standards are far more demanding. In fact, there are at least *nine specific differences* involving purity, potency and speed of tablet disintegration. These Bayer® standards result in significant product benefits including gentleness to the stomach, and product stability that enables Bayer tablets to *stay* strong and gentle until they are taken.

So next time you hear someone say that all aspirin tablets are alike, you can say, with confidence, that it just isn't so.

You might also say that all registered nurses aren't alike, either.

ANNUAL FINANCIAL STATEMENT
of the
Medical and Chirurgical Faculty
of the State of Maryland

April 23, 1969

CERTIFICATE

The Medical and Chirurgical Faculty
of the State of Maryland,
1211 Cathedral Street,
Baltimore, Maryland 21201

Gentlemen:

We have made an audit of the records of the Treasurer of The Medical and Chirurgical Faculty of the State of Maryland for the year ended December 31, 1968. Our examination was made in accordance with generally accepted auditing standards, and accordingly included such tests of the accounting records and such other auditing procedures that we considered necessary in the circumstances.

In our opinion, the balance sheet, together with the supporting statements, present fairly the financial position of the Faculty as of December 31, 1968 and the results from operations for the year then ended, in conformity with generally accepted accounting principles applied on a basis consistent with that of the preceding year.

Let's be specific about Campbell's Soups... and *reducing diets*

There are more than 30 million people in America who are overweight. During the next year, you probably will see more than 1,000 of them in your own practice.

One good way to help these patients is to give them a reducing diet based on ordinary eating patterns.

Campbell has prepared a sensible plan for weight control based on ordinary eating patterns. The plan consists of a patient instruction booklet and a set of menus which provide approximately 1,400 calories daily. The menus are balanced to provide the minimum daily requirements of nutrients.

To obtain a supply for your office write to:
Campbell Soup Company, Box 265, Camden, N. J. 08101

NOW IS THE TIME... TO GIVE HER TIME WITH OVULEN-21®

Each tablet contains ethynodiol diacetate 1 mg., mestranol 0.1 mg.

The new mother needs time . . .
to adjust to motherhood,
to give her new baby all the love
and attention he requires.
She needs time for her husband . . .
and for herself as well . . .
so that she can come to terms
with the increased cares
and responsibilities now facing her.
She needs time to decide
when she will have additional children
and how many she will have.

OVULEN-21®

Each tablet contains ethynadiol diacetate 1 mg., mestronol 0.1 mg.

GIVES HER TIME

Your prescription for Ovulen-21 gives the new mother time to meet her family's present needs...to plan for her family's future.

She can take Ovulen-21 confidently and comfortably month after month. Its dependability is enhanced by its simplicity of use. A woman needs little or no time to learn the simple Ovulen-21 regimen: three weeks on—one week off. And the automatic record-keeping of the petite, virtually "patient-proof" Ovulen-21 Compack® helps to maintain her schedule...helps put time on her side.

Immediately post partum is the time

It is the time when motivation is highest—when a new mother needs expert advice for the future, so she can space her children and limit her family.

It is also the most opportune time, since she is conveniently present in the hospital, for her to be given both instructions and a prescription.

Non-nursing mothers may begin Ovulen-21 immediately after delivery, on the day of departure from the hospital or at the first postpartum visit, as desired. It is recommended that nursing mothers begin Ovulen-21 four weeks after delivery.

A small fraction of the hormonal agents in oral contraceptive pills has been identified in the milk of mothers receiving these drugs. The long-range effect on the nursing infant cannot be determined at this time.

Indication—Oral contraception.

Contraindications—Thrombophlebitis, thromboembolic disorders, cerebral apoplexy or a post history of these conditions, markedly impaired liver function, known or suspected carcinoma of the breast, known or suspected estrogen-dependent neoplasia, undiagnosed abnormal genital bleeding.

Warnings—Watch for the earliest manifestations of thrombotic disorders (thrombophlebitis, cerebrovascular disorders, pulmonary embolism, retinal thrombosis); if present or suspected discontinue the drug immediately.

British studies reported in April 1968[1,2] estimate there is a seven- to tenfold increase in mortality and morbidity due to thromboembolic diseases in women taking oral contraceptives. In these controlled retrospective studies, involving 36 reported deaths and 58 hospitalizations due to "idiopathic" thromboembolism, statistical evaluation indicated that the differences observed between users and non-users were highly significant. The conclusions reached in the studies are summarized in the table below:

Comparison of Mortality and Hospitalization Rates Due to Thromboembolic Disease in Users and Non-Users of Oral Contraceptives in Britain.

Category	*Mortality Rates*		*Hospitalization Rates (Morbidity)*
	Age 20-34	*Age 35-44*	*Age 20-44*
Users of Oral Contraceptives	1.5/100,000	3.9/100,000	47/100,000
Non-Users	0.2/100,000	0.5/100,000	5/100,000

No comparable studies are yet available in the United States. The British data, especially as they indicate the magnitude of the increased risk to the individual patient, cannot be applied directly to women in other countries in which the incidences of spontaneously occurring thromboembolic disease may differ.

Discontinue medication pending examination if there is sudden partial or complete loss of vision, or sudden onset of proptosis, diplopia or migraine. Withdraw medication if papilledema or retinal vascular lesions are found.

Since the safety of Ovulen in pregnancy has not been demonstrated, it is recommended that pregnancy be ruled out for any patient who has missed two consecutive periods before continuing the contraceptive regimen. If the patient has not adhered to the prescribed schedule the possibility of pregnancy should be considered at the first missed period.

A small fraction of the hormone agents in oral contraceptives has been identified in the milk of mothers receiving these drugs. The lang-range effect an the nursing infant cannot be determined at this time.

Precautions—Pretreatment physical examination should include special reference to the breasts and pelvic organs, and a Papanicolaou smear.

Endocrine and possibly liver function tests may be affected by Ovulen. Therefore, it is recommended that such tests if abnormal be repeated after the drug has been withdrawn for two months.

Pre-existing uterine fibromyomas may increase in size under the influence of progestogen-estrogen preparations.

Because these agents may cause some degree of fluid retention, conditions which might be influenced by this factor, such as epilepsy, migraine, asthma, cardiac or renal dysfunction, require careful observation.

In breakthrough bleeding, and all irregular vaginal bleeding, consider nonfunctional causes. Adequate diagnostic measures are indicated in undiagnosed vaginal bleeding.

Carefully observe patients with a history of psychic depression and discontinue the drug if severe depression recurs.

Any possible influence of prolonged Ovulen therapy on pituitary, ovarian, adrenal, hepatic or uterine function awaits further study.

A decrease in glucose tolerance has occurred in a significant percentage of patients on oral contraceptives. The mechanism of this decrease is obscure. For this reason, diabetic patients should be observed carefully while receiving Ovulen.

Because of the effects of estrogens on epiphyseal closure Ovulen should be used judiciously in young patients in whom bone growth is not complete.

The age of the patient constitutes no absolute limiting factor, although Ovulen therapy may mask the onset of the climacteric.

The pathologist should be informed of Ovulen therapy when relevant specimens are submitted.

Adverse Reactions—A statistically significant association has been shown between use of oral contraceptives and the following serious adverse reactions: thrombophlebitis, pulmonary embolism.

Although available evidence is suggestive of an association, such a relationship has been neither confirmed nor refuted for the following serious adverse reactions: cerebrovascular accidents, neuro-ocular lesions, e.g., retinal thrombosis and optic neuritis.

The following adverse reactions are known to occur in patients receiving oral contraceptives: nausea, vomiting, gastrointestinal symptoms (such as abdominal cramps and bloating), breakthrough bleeding, spotting, change in menstrual flow, amenarrhea during and after treatment, edema, chloasma or melasma, breast changes (tenderness, enlargement, secretion), change in weight, changes in cervical erosion and cervical secretions, suppression of lactation when given immediately post partum, cholestatic jaundice, migraine, allergic rash, rise in blood pressure in susceptible individuals, mental depression.

Although the following adverse reactions have been reported in users of oral contraceptives, an association has been neither confirmed nor refuted: anovulation post treatment, premenstrual-like syndrome, changes in libido, changes in appetite, cystitis-like syndrome, headache, nervousness, dizziness, fatigue, backache, hirsutism, loss of scalp hair, erythema multiforme and nodosum, hemorrhagic eruption, itching. The following laboratory results may be altered by oral contraceptives: hepatic function: increased sulfobromophthalein and other tests; coagulation tests: increase in prothrombin, Factors VII, VIII, IX and X; thyroid function: increase in PBI and butanol extractable protein bound iodine, and decrease in T^3 uptake values; metyrapone test; pregnanediol determination.

Does your patient have periods of unconsciousness or amnesia?

RUTH W. BALDWIN, MD

Director

Clinic for Exceptional Child

University of Maryland Dept. of Pediatrics

School of Medicine

Periods of unconsciousness or amnesia may be due to

- Hypoglycemia related to insulin reactions, pancreatic cysts or tumors
- Epilepsy—petit mal, grand mal, focal, psychomotor
- Sensitive carotid sinus
- Hypocalcemia
- Parathyroid deficiency
- Central nervous system degeneration
- Emotional upset
- Syncopy
- Cardiovascular disorders

If any of the above are fully controlled in a responsible individual, he should be able to drive without difficulty. However, the individual who refuses to accept the diagnosis that he has one of the above, or who is careless about his medical treatment should not be allowed to operate a motor vehicle. In order to gain an operator's license, many patients who have been denied the privilege to operate a motor vehicle have taken better care of their health, followed their physician's instructions and advice and, thus, have not only gained their permits, but also have learned the benefits of better medical treatment.

So, advising your patients not to drive if any of the above uncontrolled conditions are present, may not only prevent an accident which could result in death, severe injury, or damaged property, but may be the incentive for him to follow your advice and instructions for better health and life.

From the Subcommittee on Traffic Safety of the Medical and Chirurgical Faculty of the State of Maryland

"I'm sick of spinning"

When vertigo began, her life took a turn for the worse.
Either she spins and the room stands still,
or the other way around... and around and around.
Even when she lies down, the spinning
continues. Sometimes there's nausea and vomiting, too.
It's just one thing after another.

You can help stop the spin with

BONINE®

(MECLIZINE HCl)

Bonine protects most patients against vertigo and nausea up to 24 hours with a single dose. Pleasant-tasting Bonine tablets are chewable and can be taken anytime, anywhere, without water. In difficult cases, multiple daily doses may be necessary for maximum response.

Precautions: Although the incidence of drowsiness and atropine-like side effects such as dry mouth and blurring of vision is low, the physician should alert the patient to the need for due precautions when engaging in activities where alertness is mandatory. *Use in women of childbearing age:* In weighing potential benefits vs. risk in women of childbearing age, consider the fact that a review of available animal data reveals that meclizine exerts a teratogenic response in the rat. In one study a dose of 50 mg./kg./day (50 times the maximum recommended human dose) produced cleft palate in 2 of 87 fetuses when administered to the rat at critical times during the first 15 days of gestation. At doses of 125 mg./kg./day, meclizine will produce 100% incidence of cleft palate in the rat. At doses of 25 mg./kg./day, decreased calcification of the vertebrae and relative shortening of the limbs were also produced in the rat, but experts disagree as to whether this is a teratogenic response. While available clinical data are inconclusive, scientific experts are of the opinion that this drug may possess a potential for adverse effects on the human fetus. Consequently, consideration should be given to initial use of a nonphenothiazine agent that is not suspected of having a teratogenic potential. In any case, the dosage and duration of treatment should be kept to a minimum.
Supply: 25 mg. scored tablets.

MEDICAL NEWS

The Signing of Senate Bill 149:

Photo by Stuart Whelan

Senate Bill 149 was enacted into law on July 1st of this year. This bill stipulates that individuals may incorporate and take advantage of tax situations that previously were not available to professional persons. Signers of the bill are (from left): Senator William James, President of the Maryland Senate; Governor Marvin Mandel; and Thomas Hunter Lowe, Speaker of the House of Delegates. Witnesses include: James Poland, OD, President of the Maryland Optometric Association; W. Manning Alden, MD, Vice-President of the Council of the Medical and Chirurgical Faculty; Arnold Feldman, DDS, Secretary of the Maryland State Dental Association, and Manley Davis, Esq., Executive Director of the Maryland State Bar Association.

The Johns Hopkins University School of Medicine has received a Commonwealth Fund grant of $280,000 to continue its assistance to the development of the medical schools of the American University of Beirut (AUB), Lebanon, and the Peruvian University Cayetano Heredia, Lima.

At both AUB and the Peruvian school, Hopkins has concentrated on building up postdoctoral education. The program has been conducted through exchange visits of senior faculty, and postdoctoral education at Hopkins for prospective young teachers from the overseas schools. Thus far, nine Hopkins professors and seven foreign professors have taken part, and fourteen postdoctoral fellows have been sent to Hopkins.

Hopkins' work with AUB has been coordinated by **Samuel P. Asper, Jr., MD,** Associate Dean for Postdoctoral Education, while **A. McGehee Harvey, MD,** Director of Hopkins' Department of Medicine, has organized the collaboration with the Peruvian University Cayetano Heredia in Lima.

On June 5, 1969, **William B. Kouwenhoven, PhD,** professor emeritus of electrical engineering at The Johns Hopkins University, received an honorary degree of Doctor of Medicine at The Johns Hopkins commencement exercise. The award is unique in that it is the first honorary degree to have been given at Johns Hopkins, and it is believed that only one or two other persons have ever received it from an American university.

Dr. Kouwenhoven is known for his work in developing two methods of treating fibrillating hearts. These are the external heart massage and use of electrical defibrillators, which have saved the lives of hundreds of persons after heart attacks.

Dr. Kouwenhoven was dean of the Hopkins School of Engineering from 1938 until his retirement in 1954. Presently, he is a lecturer in surgery at The Johns Hopkins School of Medicine.

* * *

J. M. Sanchez, MD, has been accepted as a fellow member in the American College of Surgeons.

* * *

Leon L. Mann, MD, James A. Prichard, MD, and David Symmes, PhD, from the Behavioral Biology Branch, National Institute of Child Health and Human Development, Bethesda, Maryland, received the Second President's Award for their paper, "EEG, EKG, and Acid-Base Observations During Acute Fetal Hypoxia." The Award, given for the best papers presented at the fall 1968 District Meetings by Fellows or Junior Fellows, was presented at the Business Session of the 17th Annual Clinical Meeting of the American College of Obstetricians and Gynecologists.

* * *

The Higher Education Loan Program (HELP) of the American College of Obstetricians and Gynecologists has $153,000 ready to be loaned out.

The loans are made to residents in approved obstetric-gynecologic training programs, interns already accepted for such a residency, and physicians in the first year of ob-gyn practice who have completed their residencies.

For further details, write: The American College of Obstetricians and Gynecologists, 79 West Monroe St., Chicago, Ill. 60663.

On June 17, 1969, **the Professional Forum** observed its Fourth Anniversary with a dinner and a series of seminars at the Baltimore Country Club. Established in June 1965 for the purpose of communication with all of the disciplines, members of the organization are drawn from accounting, dentistry, law, medicine, engineering, the clergy, the academic community, and the social sciences.

Presently, plans are being made to establish a Committee on Architecture. When these are completed, the all-male organization will have achieved its goal of being the only group in the United States representing all of the professions.

The American Medical Association's Speakers Program has been awarded a Golden Trumpet Award in competition sponsored by the Publicity Club of Chicago. The award cites the Speakers Program as the best public relations special program conducted by a non-profit organization during the past year.

* * *

Governor Marvin Mandel has announced the appointment of **Neil Solomon, MD,** to the newly created cabinet-level post of Secretary of Health and Mental Hygiene.

Dr. Solomon has been serving since February as the Health and Scientific Advisor to the Governor, having taken leave of absence from his positions at the University of Maryland, Baltimore City Hospitals, and The Johns Hopkins University.

* * *

Solomon C. Goldberg, MD, assistant chief of the Psychopharmacology Research Branch of the National Institute of Mental Health (NIMH), Chevy Chase, shared with two former NIMH scientists the Lester N. Hofheimer Prize for Research, conferred at the recent 125th anniversary meeting of the American Psychiatric Association at Bal Harbour, Florida.

Winners of the prize were cited for their collaborative research, under the auspices of the Psychopharmacology Research Center of the NIMH, in delineating the positive and negative effects of phenothiazines on various aspects of schizophrenic illness, and in correlating the symptom profiles of patients with the degree of response to drug treatment.

* * *

Frank J. Ayd, Jr., MD, internationally known lecturer, writer, and psychiatrist from Baltimore, was awarded the honorary degree of Doctor of Laws at Mount Saint Mary's College commencement exercises on June 1, 1969.

Dr. Ayd received his medical degree from the University of Maryland School of Medicine in 1945. In 1951, the American Board of Psychiatry and Neurology certified him as a Diplomate in Psychiatry. He has lectured in Europe, Asia, Africa, the Orient, Australia, New Zealand, and North America. Dr. Ayd has published more than 200 scientific articles, has contributed to more than 30 books, and is editor and publisher of several newsletters.

* * *

William M. Gatewood, MD, chief radiologist at Harford Memorial Hospital, has been elected President of the Maryland Radiological Society.

After graduating from the University of Virginia in 1950 with a BA degree, Dr. Gatewood entered the University of Louisville Medical School, where he received his medical degree in 1956.

* * *

A nucleus of physicians, both from full-time and part-time emergency care groups in Michigan, chartered the **American College of Emergency Physicians** and have organized the college on a nation-wide basis.

The college has been formed in recognition of the need for a new type of physician, a specialist in emergencies: the Emergency Physician. One of the main purposes of the college is to improve emergency services rendered to the patient.

* * *

The American Medical Association has announced the formation of an ad-hoc committee whose purpose is to establish a **National Society of Police and Fire Surgeons.** For further information write to: Howard Schneider, MD, Chairman, 75 Lee Ave. (at Mclean) Yonkers, New York 10705.

* * *

Dean David Rogers, of The Johns Hopkins University, traveled to Italy as part of a survey team to attend a conference on Italian Medical Education, sponsored by the Josiah Macy, Jr. Foundation.

* * *

Harriet L. Haskins, MD, of the department of environmental medicine, has been promoted to the rank of Associate Professor at The Johns Hopkins University.

* * *

Appointed to the rank of Professor at The John Hopkins University School of Medicine is **George H. Connor, MD,** department of laryngology and otology, and **Richard T. Johnson, MD,** neurology. In neurology also, **Daniel B. Drachman, MD, John M. Freeman, MD, and Robert M. Herndon, MD,** were appointed to the rank of Associate Professor.

* * *

Mr. and Mrs. Harry Waller have donated $50,000 to The Johns Hopkins University School of Medicine to establish in their names the Anne and Harry Waller Fund for the partial support of a Samuel Livingston Scholarship in Epilepsy Research.

Samuel Livingston, MD, is an Associate Professor of pediatrics and Director of the epilepsy clinic at Johns Hopkins.

* * *

John B. Imboden, MD, has been appointed Psychiatrist-in-Chief at Sinai Hospital and assumed his duties at the hospital in the beginning of the summer.

Dr. Imboden received his MD from The Johns Hopkins University School of Medicine in 1950. Currently, he is in private practice and is supervisor of residents in psychiatry at The Johns Hopkins Hospital, Sheppard and Enoch Pratt Hospital, and the Veterans Administration Hospital at Perry Point.

* * *

William A. Holbrook, MD, and James T. Estes, MD, have announced their association in the practice of Vascular Surgery at the Washington Hospital Center, the Physicians Office Building in Washington, DC.

* * *

Charles D. Connor, MD, was certified in both Anatomical and Clinical Pathology in May 1968, and was elected a Fellow of the American Society of Clinical Pathologists in the same year. In May 1969, Dr. Connor also was elected a Fellow in the College of American Pathologists.

* * *

A Two-year grant of $121,600 from the W. K. Kellogg Foundation will aid the **Association of American Medical Colleges** (AAMC) to develop an educational program for business officers in the nation's medical schools. The project is a logical sequence to previous assistance to the association by the founda-

tion for the improvement of cost accounting and management at these institutions.

* * *

Samuel P. Asper, MD, of Baltimore, was installed as President of the American College of Physicians at the College's 50th Annual Session at the Conrad Hilton in Maryland in April 1969.

Dr. Asper, Associate dean and professor of medicine at The Johns Hopkins University School of Medicine, succeeds H. Marvin Pollard, MD, of Ann Arbor, Michigan, as head of the international society for nearly 15,000 specialists in internal medicine and related specialities.

* * *

A vision screening program to find children living in Northeast Baltimore who may require diagnostic, preventive, or corrective treatment was held in April 1969 at the Telephone Pioneers Activities Center in Baltimore.

The community service program is sponsored by the Maryland Chapter, Telephone Pioneers of America, with the assistance of the Maryland Society for the Prevention of Blindness, a United Appeal agency.

* * *

Edward M. Holmes, Jr., MD, MPH, has been named Director of the Medical Center's Rehabilitation Programs and the Rehabilitation Research and Training Center, and Professor in the Department of Public Health and Epidemiology at the University of Alabama.

Dr. Holmes received his medical degree from Georgetown University. He was awarded his MPH from The Johns Hopkins School of Hygiene and Public Health.

* * *

The Senate Finance Committee has considered, and subsequently adopted, a bill which would repeal the medicaid provision in existing law which prohibits the Secretary of HEW from approving a Title 19 state plan that results in a reduction of any of its public assistance programs.

George E. Schreiner, MD, (right), international authority on medical and surgical care, Professor of Medicine at Georgetown University, and President of the National Kidney Foundation, presented a renewal charter for service to Edward J. Hinman, MD, President of the Kidney Foundation of Maryland, during a meeting of the Maryland trustees of the Kidney Foundation held in Baltimore.

* * *

The effect of this change will be that states can reduce the scope of some of their public assistance programs and still receive federal financial assistance. The bill will also repeal the requirement in existing law that the state must provide, by 1975, comprehensive care and services to substantially all individuals who meet the eligibility requirements of state plans with respect to income and resources.

* * *

The Obstetrics and Gynecology Specialty Group of the International College of Surgeons has announced a competition for an award to be given the author of a manuscript selected by the Prize Committee of the Group. This award will consist of an invitation to present the winning paper at their meeting in Paris, France, April 20-24, 1970, including a round-trip ticket, hotel expenses, and $10 per diem.

For further information, write to: Abraham F. Lash, MD, Chairman, International College of Surgeons. United States Section, 1516 Lake Shore Drive, Chicago, Ill. 60610.

* * *

William F. Towle, assistant administrator of The Johns Hopkins Hospital, has been named administrator of the organization that will plan, build, and operate the hospital and clinics in Columbia, Md.

The announcement was made by the trustees and officers of Columbia Hospital and Clinics Foundation, Inc. The Foundation is a corporation of The Johns Hopkins University and The Johns Hopkins Hospital, which are establishing a voluntary, comprehensive, prepaid health care program for Columbia residents.

Mr. Towle, who has been a resident of Columbia since last fall, opened administrative offices in the new city in June.

* * *

Gustavo A. Lugo, MD, former fellow in pediatric cardiology

at The Johns Hopkins Hospital, has joined the faculty at the University of Alabama as instructor in pediatrics.

* * *

At the 122nd Annual Meeting of the American Psychiatric Association, which was held last May in Miami, Florida, a way to reverse the increasing national dependence of the emotionally disturbed and mentally ill on "outside help and intervention" was offered by an Indianapolis psychiatrist.

Hanus J. Grosz, MD, said the secret is a national self-help organization known as Recovery, Inc. During a unique evening session, Dr. Grosz introduced members of the organization—each a nervous or former mental patient—who demonstrated their group techniques before the assembled psychiatrists.

* * *

The Johns Hopkins Hospital has named **B. Harvey Minchew, MD,** an official of the federal Food and Drug Administration, to head the internal medicine section at its planned Columbia health center.

Dr. Minchew, 37, who will become an assistant professor of medicine at the medical school, joined the FDA in 1963 and became deputy director of the Bureau of Medicine in January 1967.

* * *

The chairman of the AMA Committee on Alcoholism and Drug Dependence estimated that 5% of U.S. college students have tried LSD and 20% of high school and college-age youths have experimented with marihuana and other hallucinogenic drugs.

The chairman, Henry Brill, MD, of West Brentwood, Long Island, N.Y., made the estimate in testimony before the Senate Health Subcommittee.

"And," he added, "although no accurate count has been made, there are signs that the abuse of heroin and other so-called 'hard' narcotics is spreading into the suburbs."

Dr. Brill told the subcommittee that the nation's physicians increasingly "are being called upon to treat patients with drug problems, and to give counsel to anxious and bewildered parents who are discovering that 'it can happen' to their sons and daughters."

He emphasized the need for more research in the narcotics field.

* * *

Med-Chi's Councilors

Charles H. Ligon, MD, D. Frank Kaltreider, MD, and **Philip Franklin Wagley, MD,** have been elected Councilors of the Medical and Chirurgical Faculty of the State of Maryland.

Dr. Ligon, a Councilor from the South Central District, received his MD in 1942 from The Johns Hopkins School of Medicine. Since 1947 he has been in private practice as a general practitioner and surgeon, and he is an active staff member of Montgomery General Hospital in Olney, Maryland. Dr. Ligon also is an active member in the Montgomery County Medical Society, The Johns Hopkins Medical and Surgical Society, and various community organizations in which he has held many offices. Previously, he has held various positions in the Medical and Chirurgical Faculty, including Delegate, Vice President, and President.

* * *

Dr. Kaltreider, a Councilor from the Central District, received his AB degree from The Johns Hopkins University, and his MD from the University of Maryland School of Medicine in 1937. He completed his postgraduate training at University of Maryland Hospital and Baltimore City Hospitals. Presently, Dr. Kaltreider is a professor of obstetrics and gynecology at the University of Maryland Medical School, and chief of the Department of Obstetrics and Gynecology at the Baltimore City Hospitals. He holds membership in numerous organizations, and still finds time to involve himself in research activities which have resulted in the publication of over 40 papers in various medical journals.

Dr. Kaltreider

* * *

Dr. Wagley, a Councilor for the Central District, graduated from The Johns Hopkins School of Medicine in 1943 as a Franklin P. Mall Scholar in Anatomy. He is affiliated with various organizations, including the American College of Physicians, the

American Medical Association, and the American Society of Internal Medicine. Dr. Wagley has also published many papers, whose subjects range from neurophysiology to enzymology. At present, he is engaged in the practice of internal medicine, teaching, and clinical research.

Dr. Wagley

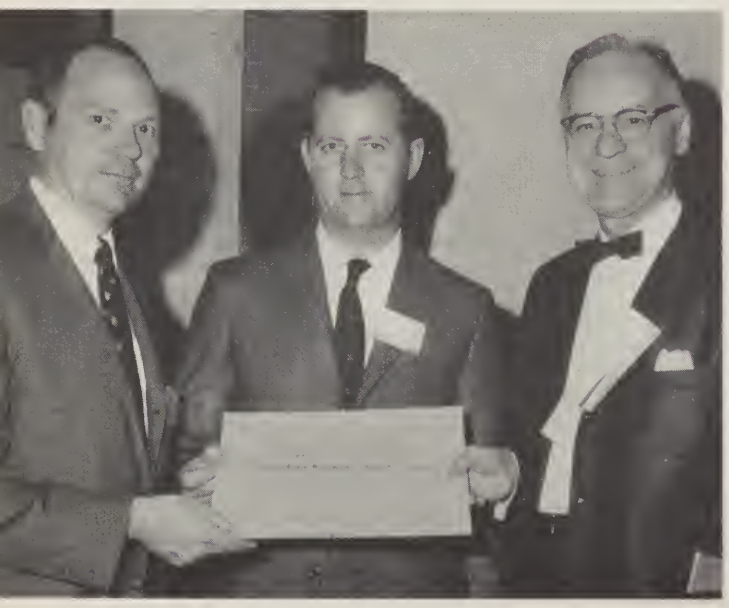
Highlights of Annual Meeting

Russell S. Fisher, MD, (left), the Faculty's new President, accepts the gavel from Arthur G. Siwinski, MD, outgoing President, during the Annual Presidential Banquet held in April in Baltimore.

THE PRESIDENTS . . .

Dr. Siwinski congratulates Richard D. Bauer, MD, immediate Past-President, during the presentation of the Past-President's plaque at the banquet.



AWARDS...

At left: William S. Stone, MD, former Dean of the University of Maryland School of Medicine, proudly displays the engraved scroll bearing the resolution presented to him by the Faculty on the occasion of his retirement as Dean. Dr. Stone was cited for his contribution in raising the educational standards of the School of Medicine; for his long and distinguished career, and for his outstanding ability in all fields of endeavor. The resolution was read during the House of Delegates meeting in April.

At Right: The 1969 recipient of the Community Service Award is Gunther D. Hirsch, MD, of Havre de Grace. Dr. Hirsch was cited for his broad community interests including everything from adequate sewage disposal to music and cultural activities. Dr. Siwinski presented the Community Service Award to Dr. Hirsch during the Annual Presidential Banquet.

At left: The Outstanding Scientific Exhibit Award this year went to Richard N. Peeler, MD, Gerald Church, MD, and DeWitt E. DeLawter, MD, for their exhibit "Coronary Care in Small Community Hospitals without House Staff."

In attempting to describe the responsibilities and areas of competence of the psychiatrist, one is tempted to simplify the task by creating the best possible image for the profession, and by avoiding controversial issues. To do so, however, would not only be an insult to the intelligence of a sophisticated audience, but would hardly advance the purposes of promoting interdisciplinary relationships.

WALTER WEINTRAUB, MD
The Psychiatric Institute
University of Maryland School of Medicine

WHAT IS A PSYCHIATRIST

Fifty years ago my assignment would have been a relatively easy one. Then, most psychiatrists worked in large public hospitals. Preoccupied with the problems of diagnosis and classification, they were modest in their therapeutic aims; basic psychiatric research at that time was pursued with the hope and expectation that the anatomicopathological basis of mental illness would soon be discovered.

If, at the turn of the century, the treatment of emotionally ill people left much to be desired, psychiatrists could derive considerable satisfaction from the fact that after two centuries of struggle, French and German clinicians had made the study of mental illness the province of the physician rather than that of the philosopher and theologian.

This moment of medical triumph was to be short-lived. Two World Wars, and the remarkable permeability of American institutions to Freudian theory and practice, loosened psychiatry from its insecure medical moorings and brought the psychiatrist out of the mental hospital into the community. In an ironic twist of fate, psychiatrists began to apply Freud's discoveries to the understanding of philosophical systems and their creators, and to teach priests, ministers, and rabbis how to talk to members of their congregations.

How is the American psychiatrist educated and what is he trained to do?

Until the completion of his internship, the education of the future psychiatrist is identical with that of all physicians. This means that the bulk of his undergraduate courses have been taken in the physical and biological sciences. His knowledge of history and philosophy is limited, and only rarely is he fluent in a classical or modern European language. It is also unfortunately true that he frequently cannot speak or write his mother language with precision and style. The American psychiatrist is, therefore, not a broadly educated person. In my judgment, much of his difficulty in working with non-psychiatrists stems from this lack of a genuine liberal arts education, rather than from shortcomings in his medical and psychiatric training.

In medical school, our future psychiatrist spends most of his time digesting huge quantities of applied scientific information. Patients are presented to him as impersonal objects to be examined, diagnosed and manipulated. That many physicians never quite outgrow this attitude towards sick people is common knowledge. It must be emphasized, however, that the ability to depersonalize patients enables the medical student and the young physician to carry out vital clinical assignments which would otherwise cause them unbearable pain.

After a one-year internship during which the attitudes assimilated in medical school are reinforced, psychiatric residency begins. In most modern training centers, the young resident is profoundly shaken by an entirely new set of expectations. All his previous medical training has conditioned him to deal with anxiety by acting decisively, giving orders, and exploiting patients' faith in his omnipotence. He soon finds these defenses to be brittle indeed.

In many centers the fledgling resident is immediately assigned extremely disturbed patients with whom he is expected to spend long periods of time in individual psychotherapy. Inexperienced though he may be, he is expected early in his psychiatric residency to assume medical leadership and coordinate teams of experienced nurses, psychologists, and social workers. If, when faced with these cumulative stresses, the young resident begins to act like his patients, he discovers that only one course of action is acceptable to his colleagues and supervisors. He is expected, through a prolonged and intensive period of psychoanalysis, to uncover and resolve the conflicts causing his anxiety.

The resident who survives this Spartan regime and completes the three years of required training, emerges with a variety of useful skills. The well-trained clinical psychiatrist is equipped to assess, by means of interviewing techniques, the over-all psychological functioning of emotionally disturbed persons. He is often able, through techniques of interviewing and physical examinations, to distinguish between somatic and psychological disability. Most important of all, he is able to offer help to individuals suffering from a wide range of psychiatric illnesses. Although individual psychotherapy is still the psychiatrist's most highly developed skill, many clinicians are experimenting with various forms of group and family therapy. Recent advances in pharmacology have given the psychiatrist additional flexibility in handling certain problems.

Various types of subspecialty training are often pursued by psychiatrists after the required three-year period of residency training is completed. Those who wish to devote their professional lives to the practice of psychoanalysis may seek further formal training at a psychoanalytic institute. Many psychiatrists are choosing careers in child and adolescent psychiatry, others in administrative and forensic work.

Whenever a profession takes upon itself the task of alleviating psychic misery, there is a risk that expectations will be aroused in the community that cannot possibly be fulfilled. The modest success that the psychiatric profession has had in alleviating neurotic pain has kindled the flame of hope in the hearts of many that its techniques can solve individual and group problems that are as old as the human race itself. Through a combination of naiveté and opportunism, some psychiatrists have fanned this flame. As a result, at a time when clinical services are said to be in short supply, many psychiatrists are attempting tasks for which their training and experience have ill prepared them.

When acting as consultants to social agencies, the schools, the courts, and industry, psychiatrists may offer opinions which are little more than rationalized biases. It is important for society to understand that the education of the psychiatrist does not prepare him to tamper with public school curricula, to reorganize communities, or to prevent nuclear warfare. His knowledge of history, government, philosophy, and economics is far too limited. It is important for psychiatrists to realize that commiting their profession to a certain point of view on major issues, before a national consensus has been achieved, is potentially suicidal.

Collaborative efforts between psychiatrists and other professionals are likely to be more constructive and cordial if the realistic limits of the psychiatrist's knowledge and skills are clearly understood by both groups.

Presented at "Psychiatry and Law," a special program for the Judges of the Municipal Court of Baltimore City. Saturday, January 20, 1968.

CLERGY—PHYSICIAN

DIALOGUES

Edited abstracts of a series of discussions held between 1961 and 1967 at the Church of Our Savior, Baltimore, Maryland.

The particular interest and value of these discussions is that they come out of the experience of clergymen and physicians dealing with patients daily. The problems encountered are concrete, immediate, and very real to those involved. The discussions are rich in specific examples. There is a determination to make Christian concern relevant to the lives of suffering people in hospitals.

A second unique feature is that the participants are Protestants. Most such discussions are carried on by "Interfaith" groups and tend to be vague, innocuous and anemic in an attempt to reach consensus. No such consensus is reached in these discussions. Views are presented with conviction, often with passion, and represent only the opinion of the speaker at the time. There are vigorous disagreements and opinions were changed. In brief, a dialogue took place. We believe that clergy-physician dialogues (whether individual, denominational or interfaith) are of increasing relevance at a time when depersonalization and "scienticism" in patient care is on the upswing. Perhaps relevance and specificity could best be served by establishing interfaith clergy-physician groups in each hospital using case presentations and discussions.

Finally, no one considered himself an expert. These discussions are offered not as answers, because we do not think there are answers to these problems. There are only individual people in trouble, cared for by fallible physicians and clergy. This insight may give other clergy and physicians of all faiths the courage and impetus to discuss their common problems in hospital practice.

Introduction

Starting in December of 1961, a group of concerned Protestant clergy and physicians got together informally to discuss common problems in the care of hospitalized patients. The following persons participated in the discussions at different times:

Richard P. Anderson, MD
Rev. Pope F. Brock
Robert Bonnor, MD
John A. Burgess, MD
Douglas Carroll, MD
David Cowey, MD
Rev. Jon Crosby
Rev. John Denham
Rev. Herman A. Di Brandi
J. William Dorman, Jr., MD
Milton T. Edgerton, MD
Warfield M. Firor, MD
James P. Gills, MD
Rev. Donald W. Gross
Rev. Charles H. Griswold
J. Alex Haller, MD
James P. Isaacs, MD
Robert Johnson, MD
Rev. David K. Johnston
Rev. Don Libby
Philip O. Littleford (Medical Student)
James McNamee (Seminarian)
Don B. Nicholson (Medical Student)
Rev. David H. Pardoe
John Payne, MD
David Sabiston, MD
Rev. Warren Skipp
Martin Singewald, MD
Richard M. Timms, Jr. (Medical Student)
William H. Talbot, PhD
Thomas E. Van Metre, Jr., MD
Charles Patten Wilkinson (Medical Student)
J. Donald Woodruff, MD
Taylor M. Wray (Medical Student)

References to specific institutions and people have been avoided. It was thought necessary to indicate whether the speaker was clergy (Rev.) or physician (Dr.), but otherwise the identity of each participant has been protected.

Mrs. Frances Grebel patiently recorded the conversations in shorthand and typed copies for each participant.

No attempt has been made to change conversational style into literary style. Minor changes have been made in the interest of clarity.

Telling People About Death

Rev. A: I have a parishioner to whom I am devoted and who is dying of cancer. Apparently, it is throughout his body, and his physician gives him next to no hope. Yet he will not tell the man that he has this disease. His family will not tell him, but I am convinced that he knows it himself. The family will not tell him because they think he will give up hope. I would like to tell him. He might be really glad to talk about it, to share it with his family, and to know that there was some kind of victory that could be wrung out of it. He probably knows that he is dying, and yet, no one will talk to him about it.

Rev. B: Your primary ministry is to the man. Instead, everyone is talking about a case. This is no longer ministering to him.

Dr. K: I think that you should talk to the doctor, and decide together whether or not to tell him.

Rev. K: How about the family?

Dr. K: I think the patient is more important than the family.

Dr. B: Do you use the technic of joint consent? We use it in the military service. The minister and the physician will discuss the question of telling the patient. I think it is a good technic.

Rev. A: The visits that the practitioner makes to the home are less and less frequent, and the man makes comments that he must have given up. The very fact that the physician has dropped off in his visits is a sign that he has given up.

Dr. D: I think it is a very common problem. I have many patients in the hospital, and it is tough to see them when you can't do anything for them.

Rev. K: Why do we not tell the patient the situation, either the clergy or doctor? It is not just because of the concern for the patient, but partly that we are not quite sure how we are going to handle it when it is in the open.

Dr. D: I do not like to tell people that they are going to die. If they are not going to be able to face it, that is a reason not to tell them. One can do damage in making a rule to tell every patient that he is going to die. I had a patient I thought would die and told the family so, but now he is well. However, there are some you have to tell.

Dr. B: I am wondering about the area of ministering to the immediately dying. What if the family tells you not to tell him he is dying, but you do and he dies. What is the legal responsibility?

Dr. G: You cannot be sued for a mistake in judg-

ment. According to law you are not liable.

Dr. B: What is the moral responsibility?

Dr. G: If your intention was to get this man oriented spiritually before he died, I think you are right. Your motive was not selfish. The only motive is to help the man prepare for death, and I think that, morally, it is all right.

Dr. S: At times your biggest responsibility is to the family and not the patient. He may be prepared to go, but the family is not prepared to let him go.

Rev. D: I had a patient who asked whether she were dying. She was in a semi-private room with a patient whom I had been visiting. My patient pretended to write to me the address of her friend to whom she wanted me to send a copy of a sermon, but when I received the paper she had written, "The patient in the next bed is dying of cancer of the throat." I began to talk to her. I continued to see her after my patient left the hospital. She was a woman of 55, very emaciated. Last Tuesday I went in and, from a layman's point of view, I felt sure that she was dying. She asked me if she were. There were two reasons I did not say, "Yes, you are." I did not know what her doctor had told her, and I did not know how he would feel about my telling her. She was very emotional, and if I told her, I felt that her death would be more violent than otherwise. I did the best I could and said, "I do not know for sure." But I was with her when she died at 7:15 P.M. This conversation had taken place at 3:00, and she was conscious until 6:30. I had intended to find the doctor, but I could not find him, and the patient did not want me to leave her.

Dr. J: Why didn't you say, "This is something that is not in my hands. Should we approach the Lord together?" And say a prayer with her. You are being totally honest.

Rev. D: I had done that two days previously. We had prayer this time also. Her husband was reading the Bible, and I asked him to read it aloud. She felt comforted because he was there reading the Gospel according to St. John.

I thought that it might be all that night and the next day. I was quite surprised when this patient went so suddenly. Could I have complicated her death by telling her? Could it have been more violent if I had said, yes?

Dr. J: I think as a clergyman you did not have to answer the question. The patient does not expect you to know. You have the advantage of not having to answer it. In a sense the patient would excuse you for saying, "I don't know."

Dr. G: When a patient asks me if he is going to die, I almost invariably ask, "Why do you ask me?" I want to know if he is afraid to die, if there is something on his mind he wants to get off. That opens up the way for an intimate conversation. If I am not absolutely certain he will die in a few minutes, I come back to the question and say, "I am glad you asked that question. When you will die is not the first thing. Let us face the first thing, the inevitability of death. Everyone has to face it." Some mean, "Am I going to die of this disease"? Find out why he asks the question.

Dr. S: I think that the patient's mental and emotional state has a tremendous bearing upon what you say. Are you dealing with a patient who is so toxic from his illness that he is really unable to grapple with anything, or are you dealing with a patient with full faculties?

Dr. G: Both physicians and clergy have an inescapable responsibility to relieve the suffering of the dying and of the relatives. The control of pain is the full duty of the physician. Alleviation of mental anguish is the responsibility of both groups. The ministry to the spiritual needs of the patient is primarily that of the clergy, but also to a degree, that of the doctor. Rigid rules cannot be laid down, but the basic principles can be:

1. There comes a time in which it is the duty of the physician to help the patient to die comfortably.
2. Treatment designed solely to prolong existence is contraindicated.
3. The question of facing the fact of death: Generally speaking, it is preferable to break the news gently to the patient. Patients can stand anything except untruth and sustained uncertainty.
4. An absolute prognosis as to time of death is nearly always inadvisable.
5. Relatives must be given rest, particularly when death is drawn out.
6. Dying patients never like to be left alone.

From the spiritual side, the Almighty alone knows the spirit-experience and status of the individual patient. All we can hope to do is to be dedicated agents so that God can work through us in each instance. If we are really dedicated persons, what difference does it make whether we are clergymen or physicians? It is the relationship of the individual to God Almighty, and we must keep in mind that we are simply agents. This is as far as we can go.

Palliation and Allowing Patients to Die

Dr. I: One of the real problems that I have in medicine is approaching the problem of palliation, making the patient more comfortable, when there is no cure. The longer one is in medicine, the more one wants to win the game. And yet, palliation is an extremely important part of medicine. It requires far more insight than to say that this is a

cancer of the toe and take it off. The responsibility of the physician is to help a patient live with his illness and remain whole. An example would be arteriosclerosis, a generalized disease. There is no cure. And yet we are called upon often to remove an area of vascular constriction. This is a form of palliation. It may be dramatic, but it does not represent a cure. When the next area, which has already narrowed, produces symptoms, then rapport dissolves. With limitation of time, many physicians are not willing to spend time in re-establishing rapport. We have to call on the other members of the team to help. Some of this can be and should be delegated. This approach is very important.

Rev. A: Are there many surgeons who would not have the time to sit down and tell the patient about his condition, and say that this will help temporarily, but you may have a recurrence? Does a physician get so busy that he cannot discuss it?

Dr. I: Some of us find it difficult to admit that we are not perfect in our ability to heal. You feel that you should be able to relieve everything. It is a form of personal dishonesty, but all the patient requires of me is that I be honest. He doesn't expect me to be a miracle worker. The doctor thinks he is a miracle worker, but the patient does not. He expects honesty.

Rev. A: The doctor could honestly say that he could relieve the patient to a certain point, but this does not mean a cure.

Dr. I: You have to think of yourself a little. It is a little selfish, but it is not right to put yourself in the position of later saying that you could not effect a cure. If it is a chronic problem, but can be relieved, I think it is important to get this insight across. Recently, I saw a patient who had a sudden thrombosis in the leg with severe pain. It was obvious that the leg would have to come off. She was not ready to accept that. We let her go for a while, and within 36 hours she said, "You are right. I am going to have to live without my leg." And then it was removed. If I had removed it earlier she would have had all kinds of mixed emotions about a leg which might have gotten well. We gave her 36 hours of pain of which she could have been relieved. This is where it gets hard. If you don't have the time to spend with the patient, you should get someone else to help. There are some people who by nature would not want to spend that period of time to help a patient to make up his mind. You can get in trouble in medicine in having a patient who is not grateful and who does not have a good result, even after good treatment.

Dr. I: Today I saw a difficult patient who had a breast removed for cancer two years ago, and who subsequently developed spread, and now all the various kinds of medicine that are available are being used to keep the patient going. It is difficult to know when life is really life and not just an organic existence. The artificial pace maker, the various medicines that keep the blood pressure up. . . . Where does palliation become automation?

Rev. A: A great deal would depend on the individual response from the patient. In case of the young woman with cancer, is she aware of her condition and what it is likely to ultimately lead to?

Dr. I: I think she is.

Rev. A: I wonder how she is taking it.

Dr. I: She was smiling with euphoric drugs. You wonder if it is only skin deep. That is the most difficult area in medicine to know when it is no longer worthwhile continuing organic life artificially. It requires about one more year's experience than you get in your lifetime. No one wants to see his patients die. But one responsibility is to let them die comfortably, gracefully. It has gotten so you can't come into the hospital and die gracefully. One example is of a mongoloid with an I.Q. of ten and an abnormality of the duodenum. The patient cannot live without an operation. Do you operate on him? Are you penalizing the child and the family by operating on this mongol? Mongolism is a sort of unpredictable kind of condition. It is impossible at birth to be sure what the functional ability of the human being will be. You can't be sure whether it is a subnormal individual or a real idiot. For this reason it is an even more difficult decision. How do you feel about this problem?

Rev. E: It is a frightfully difficult one. It is interesting to hear some of the process you go through of whether to sustain life or not. The possibility of what the mongoloid case can be—what is the chance of being slightly subnormal?

Rev. A: Did you talk to the parents?

Dr. I: What we are really saying is what happens to so many people in medicine. You feel you are responsible. You take it upon your own shoulders as though you caused it. Then you can't be objective. You have to be objective if you give the proper advice to the parents. What has to be done, as nearly as you can judge as a trained specialist, is to tell the parents what you think the situation is, but the decision has to be theirs. You have to remain an objective advisor. You did not cause it, a birth defect or trauma. The best thing you can do is to give the parents an evaluation. This is a newborn they have been looking forward to. It is either the first child, or there has been a big gap. I think your responsibility is to get across to one of them, what the situation is. You may feel that the patient should or should not be operated on, but the decision has to be theirs. Otherwise, you take upon yourself a responsibility that I don't think is yours.

Rev. G: The clergyman is in the same position. He cannot save people.

Rev. E: A lot of clergy would say, that as long as there is hope of life, everything must be done. I don't think that I would feel that way. Just to keep somebody alive does not make sense at all.

Rev. D: I personally take a very realistic view in this same way. Just to prolong life is not the thing to do. The people involved have to make the decision. Everyone has to cooperate with them in that decision.

Dr. I: About three months ago there was a mongoloid baby born with duodenal atresia. The mother went to pieces. It was the first baby. The father said he could not take the baby home. The house staff felt very strongly that the baby should be operated on, but the father did not want him operated on. The house staff put a tube in the baby's stomach, and a cutdown needle in the veins, and gave the baby fluids for six days. They could maintain him this way. What do you do with such a patient? You can't shut the door. It is a human being. It was a very upsetting experience for the pediatric house officers. The outcome was that finally some higher up made the decision to cut off I Vs and the patient died in 48 hours.

Rev. A: In this type of situation as Christians, part of the answer for the physician or the clergyman or any Christian is to make it quite clear that God is God of all things, and that this might not put too much premium on life here and now. It is not lost even if one died. If you believed this, it might help a parent to decide to let a child die, if they felt that it was not sinful to let it die.

Dr. I: Let me suggest another aspect. Through the ages, the statement has been made about congenital heart disease: "This is an act of God. They all die." We would not have the Blalock operation today if somebody had not had the insight to alter this and say, "Let's try. Let us see if we can't save some by surgery even though the mortality may be high."

Dr. M: I would like to ask you if leaving the responsibility with the parents, they may have a burden of guilt. This could be that, "I killed that baby." In selected cases, might it not be better to make that decision yourself when you see the parents will not be able to make it?

Dr. I: Some physicians will. I won't. I don't have the total insight into what will happen in that family. There are physicians who will say, "This patient will die in six months. There is nothing more to do." They will leave the family and the clergy to work it out. I am not critical of that. I don't belong to that way of life. But what you are talking about is important. Recently, a baby was born without any eyes, with no nose, with no passageway between the nose and mouth, a large umbilical hernia, and probably internal malformation. This baby could not possibly live as it was. It could not breathe. A newborn baby cannot breathe through its mouth. They put in a little airway to breathe. They called me to operate on the abdominal situation. I was appalled. I talked with the parents. They had a sixteen-year-old son and no other children. The father said he did not want the mother to see the baby, but he wanted the baby operated on. He felt there was no problem. In a couple of years, eyes could be transplanted. You have to try to bring some reason into this. I tried. He finally saw that it would be impossible to put eyes in the baby. He said, "There's Helen Keller." He felt that plastic surgeons could do something about the nose. This family, particularly the husband, would never be able to live with himself unless every effort was made to keep the baby alive. I repaired the abdominal defect and inserted a tube for feeding. The baby died five or six hours later. The family was delighted that the baby died. There was no guilt feeling. Everything possible was done for their baby. At autopsy the baby did not have any brain. But I do not think it was a worthless night, because we now have whole parents. But it is hard to be enthusiastic about that kind of surgery. I can't apply this approach to the Mongol because I don't know what the outcome there will be.

Rev. D: Something you said about the parents having a guilt feeling . . . it takes a lot of work to build up responsibility, not only in surgery and medicine, but in other realms of life. Neurotic guilt belongs to the psychiatrist, but there is a healthy spiritual guilt that takes care of us spiritually.

Dr. I: Every congenital abnormality is accompanied by guilt on the part of the mother and father. They ask, "What did I do?"

Rev. D: The same thing with responsibility. Some lack of it is moral, some is neurotic, some is spiritual.

Dr. I: I don't have the answers. It may be, in the long run, healthier for the parents to have a deformed child and care for it and let it grow up, and let the parents have the insight into life, than to have it taken from them.

Rev. A: You get to a point where you have to deal with each individual or each family unit as an inividual proposition.

Dr. I: Every day you were taught in medical school to treat the patient as a whole person.

Rev. A: Despite a poor medical outlook, something really good may emerge from the situation. Other factors may happen that give strength, aid and comfort to such a person. Either God is absent or he is a going concern with us. At least for clergy I think this is the point where we believe, despite the fact that medically nothing more can be done.

Dr. I: A lot of physicians talk to their patients alone and tell them they have cancer. Then they will talk with the next most responsible people. I bring the family in so that there is no question about the truth. I do not say, "You have an incurable disease." But I say, "We were not able to remove all of the cancer. There will be medicine and X-ray treatment." The family won't feel uncomfortable around the patient who has an incurable disease. There are some patients whom you don't tell. By and large, the patient who has cancer knows it and you are not fooling him. If they ask me point blank, I say, "Yes," and I say what has been done and what can be done. If they don't ask, I don't tell them, but some person in that family must know.

Dr. T: How do you alter your procedures to deal with the mentally ill? It seems to me it would be impossible if they were unable to grasp anything.

Rev. D: Initially, the only thing I would do is support him if possible. I play a supportive role to the patient and the family. I know it is beyond whatever I can do, and I leave it up to the psychiatrist for a diagnosis.

Dr. T: Can you treat him spiritually?

Rev. D: Some of these patients will have real questions about God and religion. I give blessings, Holy Communion, where it is indicated, daily prayers, and frequent visits to patients where indicated.

Dr. T: What about a Mongol if the family wants you to do something.

Rev. D: I would talk to the family, but for the Mongoloid I give him a blessing of the Church, and put him in the hands of God, in God's wisdom to take care of him. I think this is what we all do. I think, in my faith and my training, everything tells me that something is being done. I have seen it many times with this expectation that something can be done. That element of hope and optimistic expectation is very important both to the clergyman and to the patient.

Rev. A: I would hope that the clergyman would go in the expectation that in some way God was there and was acting in some good way, even though the clergyman could not determine it. This is an act of faith.

Rev. D: The most frustrating type of patient to me is the alcoholic. I can go more blindly in faith with a Mongol than when I have to deal with alcoholics. I am too much involved with them. I do not believe that anything can be done. They just want to take your time and possess you. I want to do them a bit of good. As a clergyman and according to my own integrity, if I didn't have faith in God and the Church and the sacraments, I would give up. If I could be selective of patients I see, they would be out. These are to me the most frustrating, because I, as a man, don't see what I am doing for them, and I am in a long line of men who are being used.

Rev. G: That is the way I feel with a hypochondriac.

Rev. E: Do the doctors get the feeling that the clergy will go to the doctor and ask the real truth regarding the life of the patient, and all doors are closed except insofar as the medical judgment is concerned?

Dr. I: I have not had that kind of an experience. I don't always tell my minister friends everything about the patient's medical history, simply because I am not sure they are asking entirely for reasons of help. I have the same feeling about ministers as I do about physicians. But if a minister comes to me and wants to know the medical diagnosis in an effort to help, I am delighted to give all I know. But if I think it is curiosity, I will give him the same information he would get through the Admitting Office.

Rev. A: When the doctor says that the patient has a particular kind of cancer, this gives me some kind of knowledge and expectation, and whatever I do from then on is predicated solely by what the doctor has told me.

Aids in Facing Death: Prayer, Preparation, Love

Rev. A: Everybody has to talk out of his experience. I am in a large parish, and we have a great deal of sickness. I know now eight people who have cancer in one form or another to whom I am very close. If I go to a doctor and he says that, in his judgment, the patient not only has cancer, but it will take the man's life within six months or a year, this to me is undoubtedly quite sound as far as the medical side is concerned. Then I ask myself, "What can we bring to bear, if anything, to this situation?" assuming that the doctor is a real Christian and I am a real Christian. Sometimes I think that something else should be added. For three years there has been a prayer group of about ten women. They have met in season and out of season. They took on the blind commitment that in some real way Christ came to heal the sick. The Lord humbled me when I really saw a little group of people who made a faith commitment that the Lord can do something in this world. When I go to visit the sick, I do something more than murmur the words from the Prayer Book. I had done this before, but without the real expectation that Christ would do anything, not really committed myself to say that Christ can and will do something. When I see people now, I believe I am able to pray a much deeper and more honest prayer in the name of Christ than I

did before, because of this small group of Christians who have gone out on this limb. When I talk to people I say, "I know you have this trouble, but I know a group of people who believe that Christ can take a hand in the lives of people. If you will come in and sit in on a meeting, I believe that you will come out of it with the real conviction that Christ is in the middle of the experience. In this sense I believe that Christ can really speak to you and you will know what it is to be healed." If we do believe in God, He has promised to come and to take a hand in the very serious and crucial periods that people go through.

Dr. G: Christ did not promise to spare His followers of suffering, but promised to take away the fear. All of these people are going to die. Christ did not say that physical death has been abolished.

Dr. D: All of life is a preparation for death. We die daily, or we live daily, and I think that this is the emphasis. The time to prepare for death is when people are healthy and not when death is imminent. This is the important time to think about these things.

Rev. A: It is hard to get people when they are well to grapple with this. When I have a patient, sometimes the question is whether or not I really care enough to pay the price, no matter what my schedule is, to get there four times a week. He knows that someone cares, and when this is communicated, you can see the results.

Dr. S: If you want a person to stand on his feet, you must get out of this relationship so that he does not need you four times a week. He must come to it with his own strength.

Dr. D: What the patient wants when he is dying is to feel that God cares, and other people care. I think people can face death better when they have somebody with them who understands that they are going to die.

Dr. K: What bothers me, Rev. A, is that you said these are people that you love. You don't love everybody, and I don't love everybody that I am connected with. I love them inasmuch as they are children of God, but I don't have a personal love for them. That surprised me.

Rev. D: Physicians and clergymen can care about what happens without being lovingly involved.

Dr. S: There are some people who can be awfully hard to care for.

Dr. K: I have a patient who I do not like, but I care about her tremendously.

Dr. D: We are all forgiven sinners, and, therefore, when we get some person who is being sick because she wants to be sick, I think for the Christian the fact that I am like this makes it easier to accept her and try to love her.

Dr. K: My patient is absolutely selfish.

Dr. D: I am the same way, and I need to be forgiven, and it helps to know that we are in the same boat.

Dr. G: The concept of the image of God in every human being is important. The image has been marred, and it may be so much so that I cannot see it, but bear in mind that there is some little remnant.

Rev. D: I mentioned one approach before: to get people to think about death and to talk about it when they are in good health. You almost have to get them in a crisis situation. With all of the deaths with which I have had experience, I take the opportunity to talk to the family about death. This is where I get in the teaching. I have tried in sermons to talk about death. People are not particularly interested when they are in good health. In a crisis situation, you can do it in a small group. If you can do it with the relatives, it is a job well done. With this case I just had, I talked to the husband right there. When his time comes, I hope that we found something together that will stand him in good stead. At two o'clock one morning, I had four members of a family together, and had the opportunity to talk to them. It was a beautiful death. We were all there with the patient when she died. It was the husband who said, "Let us pray."

Rev. A: A Christian, as an individual, must wind up identifying himself at least with some small pocket of Christians with whom he has had an experience of God working through a group of people, and he can do things that he cannot do going out by himself: a small pocket of Christians who have gone out on a limb.

Dr. S: Preparation for all the other sacraments gives the man the strength to go on from day to day so that he does not fatigue and can face death when it comes and stand on his own feet.

Rev. A: I think we should expect something of one another, but I do not think that we should expect an individual to do what a group does. The Lord called 12. He sent them out only after they had had some real appreciation of what it was to be bound together. When people get sick, I have a notion that if I were really living my faith, I would be able to truly communicate to the sick person, "You come with me and we will go to a certain place, and I really believe that Christ will help us in this situation."

A person cannot do what a group can do if the group is really alive.

Dr. D: One of our problems today is that we do not see God at work as He was seen in the past.

The prophets saw the Spirit coming down. If people get together and pray, I think that real things happen. In a group like this one, the Holy Spirit is at work, and things happen that you might not expect to happen.

Why Keep People Alive?

Dr. D: I see many older people with "chronic brain syndrome". Our practice has always been to keep them alive as long as possible. What is the reason we try to keep people alive from a theological point of view? The only justification, I think, is the hope that he will change his relationship with God.

Rev. C: One of the reasons for our hesitation in telling people they are going to die is that in our culture, there is such a fear of death. We cover it over with everything. My reason for telling a man that he will die would not be to convert him, but to try to teach him the great meaning of death. I think death is the most important part of life. If he can face this as a Christian and take full advantage of what death is, this can be the greatest moment in his life. By not telling a man that he is going to die and having him dread it, and talking about him as though he were not a person, it can terrify him.

Dr. K: Don't people open up to you when they find death is inevitable?

Rev. D: They usually talk to me. If someone has a deadly fear of death, I do not think there will be a radical change in his thinking. If he has no fear, he will make his peace with his Maker and accept the fact. The problem is that so many people have this fear. No matter how much theology you tell them, they die a horrible death.

With a person with any religious experience in his life, I have generally found that something happens to that person as he approaches death which I call the merciful preparation of God for death. I have found a different orientation, preparation, or a change of some sort which I attribute to God's mercy and compassion and guidance by the Holy Spirit. More often I have been able to talk to them about death.

Dr. B: I had one experience where a patient committed suicide after being told. This makes me shy in telling others.

Rev. A: I am bothered about the theory of keeping a person alive for extra time, solely in order that he can develop a better relationship with the Almighty. I have a feeling that when Christ came into the world His compassion was the real quality of healing. Compassion itself is more important than hoping the patient will develop a better relationship with God.

Dr. K: Should the physician allow patients to die? We have heard of men who will allow people to die. Do you think they are using compassion? I do not think that they are cutting people off from a relationship with God.

Dr. B: I know a patient, who was a vegetable, who lay for two and a half years in a coma, but one day he awoke. He regained all his faculties. This man was fully conscious of what went on during that time even though he could not tell us. When you get a case like this, who can decide?

Dr. K: There is a child in the hospital now who was supposed to be hopelessly ill, but is now getting more and more normal all the time.

Dr. B: I am bothered by the philosophy of the physician who will let a patient die.

Dr. K: I think you assume a certain amount of responsibility with your education, teaching, and experience. To some physicians, there is a justification which they use in letting a person die. I would want somebody to let me die.

Dr. B: Just because you want to die does not make it right. As long as the flesh responds to my ministrations, I must keep on.

Dr. G: There is a theory presented that one of the skills of a physician may be to end life.

Dr. K: There is no question in my mind and none in Dr. B's that we are right, and yet we are on opposite sides. One has to take one's responsibility. I have just seen an aunt die whose physician was exquisitely sensitive.

Dr. G: I do not think you can have a hard and fast rule. You have to differentiate between the doctor who is motivated by humanitarianism and one who looks upon his profession as the agent of the Almighty, in which case there is one patient in whom he may allow life to terminate and another where he persists. There are people who have been allowed to die because the physician felt that he was doing the will of God.

Dr. K: Would you modify your stand on this, Dr. B?

Dr. B: Yes, I am sure if I had a terminal cancer patient, I would not be heroic. If I give them maintenance and they live, however, I am not going to clamp off the intravenous fluids.

your medical faculty at work

by John Sargeant
Executive Secretary

At the Executive Committee meeting held on Thursday, May 8, 1969, the following actions were taken:

1. Determined that Council meetings held before and after House of Delegates sessions should not be marked "closed sessions" in the printed program of the Annual Meeting.
2. Reaffirmed the Faculty's position of support of Senate Bill 512, which would establish a Commission on Optometry Discipline.
3. Decided that the President, President-elect, Council Chairman, and Executive Secretary should represent the Faculty at any conference with the Governor to discuss mutual health problems. Should any of the other officers be unable to attend, the Council Vice-Chairman will act as a substitute.
4. Submitted the following list of individuals to the Governor for consideration for appointment by him to the Commission on Medical Discipline:

   John M. Dennis, MD, Baltimore
   George R. Spence, MD, Silver Spring
   Charles Bagley, III, MD, Salisbury
   Charles R. MacDonald, MD, Glen Burnie
   Charles F. O'Donnell, MD, Towson
   Karl F. Green, MD, Westminster

   All of these names were submitted by the component societies of the Faculty, in accordance with the law.
5. Agreed to meet with the Executive Committee of the Maryland State Dental Association to discuss mutual problems.
6. Designated John C. Krantz to serve as the Faculty's designee to attend the 1970 Decennial Pharmacopoeial Convention.
7. Heard various items, including information that the Nurses Liaison Subcommittee has given an opinion that licensed practical nurses may administer intradermal injections for tuberculosis, but that this should not be delegated to unlicensed persons.
8. Heard that the case of Joseph Fazekas, MD, against the Suburban Hospital Association had been settled, and the Faculty can consider its participation in this matter closed.
9. Authorized expenditure of funds to combine various Faculty publications into one publication for distribution to members and newly-licensed physicians.
10. Agreed to withdraw as a member of the Administrative Committee of the Regional Medical Program, since no further benefits can be gained by continuing membership in this group.
11. Approved new proposed nursing home regulations to be published by the State Health Department.
12. Authorized submission of two names to be considered for appointment to the Continuing Committee to Study the Medical and Surgical Fees Under Workmen's Compensation Commission.
13. Authorized sustaining membership in the Maryland Public Health Association.
14. Authorized revision of the list submitted to the Governor for appointments to the Board of Physical Therapy Examiners.
15. Declined to provide lists of expert witnesses to testify in court cases concerning criminal charges against a physician, such action being taken on the advice of legal counsel.
16. Authorized free use of Olser Hall by the staff of the Division of Alcoholism Control, State Department of Mental Hygiene.
17. Authorized formation of an Ad Hoc Committee on Dialysis Standards.
18. Submitted to the AMA Council on Medical Education a list of Directors of Medical Education and others to be invited to a regional meeting in New York city on July 12, 1969.

Skilled Hands That Care

Twenty four hours a day . . . in bright, modern facilities, the aged, chronically ill and convalescent, receive professional care, nutritional balanced foods . . . and occupational and recreational therapy programs.

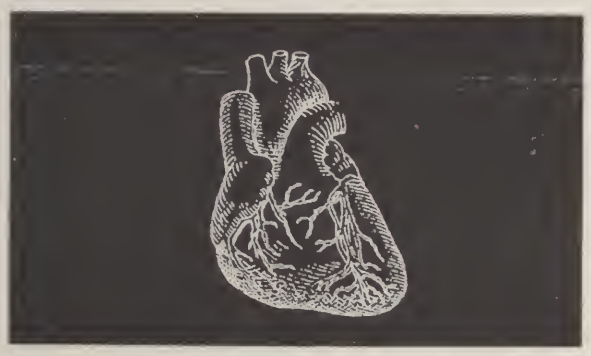
For Safe, Sure, Speedy Relief —
— Get RESINOL GREASELESS!

Medical Scientists have conquered 6 dread diseases in the past decade, but they are largely in the dark, they admit, in finding relief for one age-old ailment—itching



New remedies containing antibiotics have been tested, but have often caused side effects which are worse than itching skin. After many years of research and testing, Resinol Greaseless Cream was developed. . . . A doctor's formula containing safe yet powerful ingredients, Resinol Greaseless contains an amazing, proven "anti-itch" medication called Resorcin, which quickly and effectively relieves most any kind of itching. Try Resinol Greaseless . . . You'll be delighted to find that it really works! At all drug stores. Buy a tube today.

Artificial Cardiac Pacing—Current Status

MIRIAM L. COHEN, MD
RICHARD D. BIGGS, JR., MD
Senior Fellows-in-Cardiology
University of Maryland School of Medicine

The earliest recorded instance of successful electrical stimulation of the heart was in 1870 when Duchenne used this technique on the pericardium of a patient dying with bradycardia. Few advances were made until 1952, when Zoll reported use of externally applied electrodes to pace the heart of patients with Adams-Stokes disease. In the late 1950's internal cardiac pacing, utilizing endocardial catheters and epicardial electrodes, was reported.

The types of pacemaker units now available can be categorized in various ways. Temporary pacing for transient rhythm disturbances requires an external power source (impulse generator) which is connected to a transvenously-placed electrode catheter, the tip of which is in contact with the right ventricular endocardium. Permanent pacing may be established in either of two ways: (1) electrodes may be sutured to the epicardium via a thoracotomy, or (2) an electrode catheter may be inserted through a peripheral vein and advanced into the apex of the right ventricle. Each of these systems has as its energy source a subcutaneously-placed impulse generator. These implantable battery units are basically of two designs. One functions to stimulate the heart at a fixed, predetermined rate. The other, the demand type, is synchronized to pace only when the patient's intrinsic rate falls below a pre-set level.

Indications

At present, electrical pacing is recommended for individuals with complete and high-grade atrioventricular block and symptomatic bradycardia of any type. Some authorities also advocate electrical pacing for prevention and treatment of recurrent tachyarrhythmias. Lightheadedness, fatigue, weakness, congestive heart failure, syncope, and angina pectoris are often manifestations of these arrhythmias.

Pacemaker Follow-Up

The importance of continuous, long term follow-up of patients with permanent pacemakers is becoming increasingly evident. The average life of the power-source batteries is usually in the range of 15 to 30 months. Battery failure may be first manifest, particularly in a fixed-rate unit, by an alteration of $\pm$ 5 beats per minute. Some centers evaluate pacemaker function by interval electronic analysis of the generator wave form. All methods of follow-up care are directed toward early detection of battery failure, so that complete battery failure and subsequent return of symptoms can be avoided. To this end, it is currently recommended that a patient with a pacemaker be taught to count his own pulse each day and that he be seen at least every three months by his physician. At each return visit, the patient should be evaluated clinically and electrocardiographically. The EKG will indicate significant changes

in heart rate and may provide evidence of failure of the pacemaker impulse to stimulate the heart.

Complications

Though pacemakers are most beneficial and are frequently life saving, they are not without problems. The complications encountered most frequently in several large series are noted in Table 1. In addition, approximately 3% of patients who have had pacemakers inserted may have early or late failure to pace or intermittent pacing because of hypokalemia.

Displacement of the catheter electrode tip often results in failure of pacing and a return to the patient's intrinsic rhythm. Likewise, electrode wire breakage, battery failure, insulation defects, and penetration of the myocardium by the catheter tip may all result in pacing failure. Electrolytic, fibrotic, or myocardial reactive changes about the electrodes, known collectively as exit block, may produce intermittent or complete cessation of pacing. The above complications should be promptly corrected; some will require surgical intervention and others may necessitate medical management (e.g., potassium replacement for hypokalemia and corticosteroids in certain types of exit block).

Battery failure may be heralded by a change in rate of pacemaker activity by ± 5 impulses per minute. It is presently recommended that battery replacement be effected shortly following detection of such a change in rate. This procedure obviates the problems attendant to complete pacer unit failure. Such total generator exhaustion may result in no electrical output or may produce extremely rapid cardiac stimulation—a situation termed runaway pacemaker.

The use of a fixed rate pacemaker may, at times, result in the phenomenon referred to as competition. Competition is in evidence when the patient's own rhythm is re-established and the fixed rate pacemaker "competes" with this intrinsic rhythm for control of ventricular electrical activity. Though often benign and the source of irregular cardiac action, competition may produce lethal arrhythmias by the fortuitous occurrence of a pacemaker impulse in the vulnerable portion of the electrical cycle. If competition occurs, or is anticipated, a demand type generator should be substituted for the fixed rate unit.

Infection and thrombosis are often problems associated with the implantation of foreign objects. Fortunately, in the clinical experience with pacemakers, these complications have been infrequent.

Summary

Electronic pacemakers are of increasing benefit for many patients with recurrent and unmanageable arrhythmias. The history of and indications for pacing are briefly reviewed. Stress is placed on careful and attentive observation of these patients following pacemaker insertion; such follow-up by the private physician or a pacemaker clinic is essential in order to detect battery failure and to properly treat complications.

References will be supplied upon request.

TABLE 1

Complications observed in several large series of patients with implanted artificial pacemakers. Percentages are derived from the series at University of Maryland Hospital and other centers.

Complication	Time of Occurrence	Signs and Symptoms	Incidence
1. Displacement of catheter electrode, occasionally with perforation of the ventricle	Usually early	a) Failure to pace b) May pace diaphragm c) May produce chest pain	5–15%
2. Infection in the pacemaker system	Early	Fever, abscess, and sepsis	1–3%
3. High threshold & exit block	Early	Failure to pace or intermittent pacing	2–14%
4. Thrombosis around catheter with pulmonary embolization	Early	Symptoms of pulmonary embolism	Rare
5. Competition	Early or late	Possible ventricular arrhythmia, ? sudden death	15–25% (in fixed rate units)
6. Penetration of the generator pack through the skin	Late	Dehiscence	0–9%
7. Catheter lead breakage or crack in insulation	Late	Intermittent pacing	3–11%
8. Battery failure	Late	Failure to pace or runaway pacemaker	Variable (occurs in all systems with time)

WILLIAM J. PEEPLES, MD, MPH, COMMISSIONER

Maryland State department of health

Comparative Price List:

Generic* vs Brand Name Drugs

In 1968 William J. Peeples, MD, Commissioner of Health, sent to all physicians letters with lists comparing prices of brand name drugs and products distributed by chemical names. The letters were merely informational.

At that time, many physicians were unaware of the extent of price ranges of drugs produced by different companies. Some variations may be justifiable, but others may be questionable. To a greater degree than is generally known, major manufacturers produce drug products which they market under their own name and sell to repackagers and distributors for sale under generic names, or another company name.

Another reason for Dr. Peeples' letters was that several large, reliable manufacturers had reduced prices of their "brand name product" to a point at which they actually were competitive with generic products of an unknown manufacturer, and sold by either a local or out-of-state distributor. Many physicians may not have been aware that the same chemical products were manufactured by various large companies.

Although some of the inexpensive products are not stocked by all pharmacies, the fact remains that they could be obtained. It is possible that pharmacists lacked the confidence to stock the various drugs which, in recent years, have become available from more than one source. Increased use and availability of drugs from companies other than the original manufacturer probably will be the factor which will influence physicians to order more drugs by their chemical names.

The comparative lists were well received by most physicians, as evidenced by numerous requests for additional copies, and it seems timely to reproduce it here.

All avenues to reduce costs without lowering the quality of care for needy patients must be explored, and the Health Department will continue to distribute information on prices of drug products as it becomes available. The task of reducing drug costs must be a joint effort on the part of prescriber and dispenser. It would seem that good prescription practices are far more efficacious to economy than formularies can ever be.

** The term "generic equivalent" was not used in any recent HEW Drug Task Force reports because many differing interpretations have caused confusion; for the same reason, it is not used here.*

Now When You Recommend Moist Heat,

Recommend Automatic Moist Heat.

Until now, application of moist heat required boiling water, hot towels, and somebody to apply them. The Battle Creek THERMOPHORE changes all that. It provides instant and automatic moist heat, intensely hot, deeply penetrating. The patient simply plugs it into an outlet. This unique hot fomentation pad then generates its own moisture from the air. Intensely hot moist heat is constantly maintained, and evenly distributed throughout the pad. No water is needed, no filling or emptying is required.
Large 13" x 27" pad covers back, or chest and abdomen, or both legs. Safety thermostat turns it off automatically, prevents overheating.
Price is **$35.00.** Also available in medium size 13 x 13 **$25.00.**

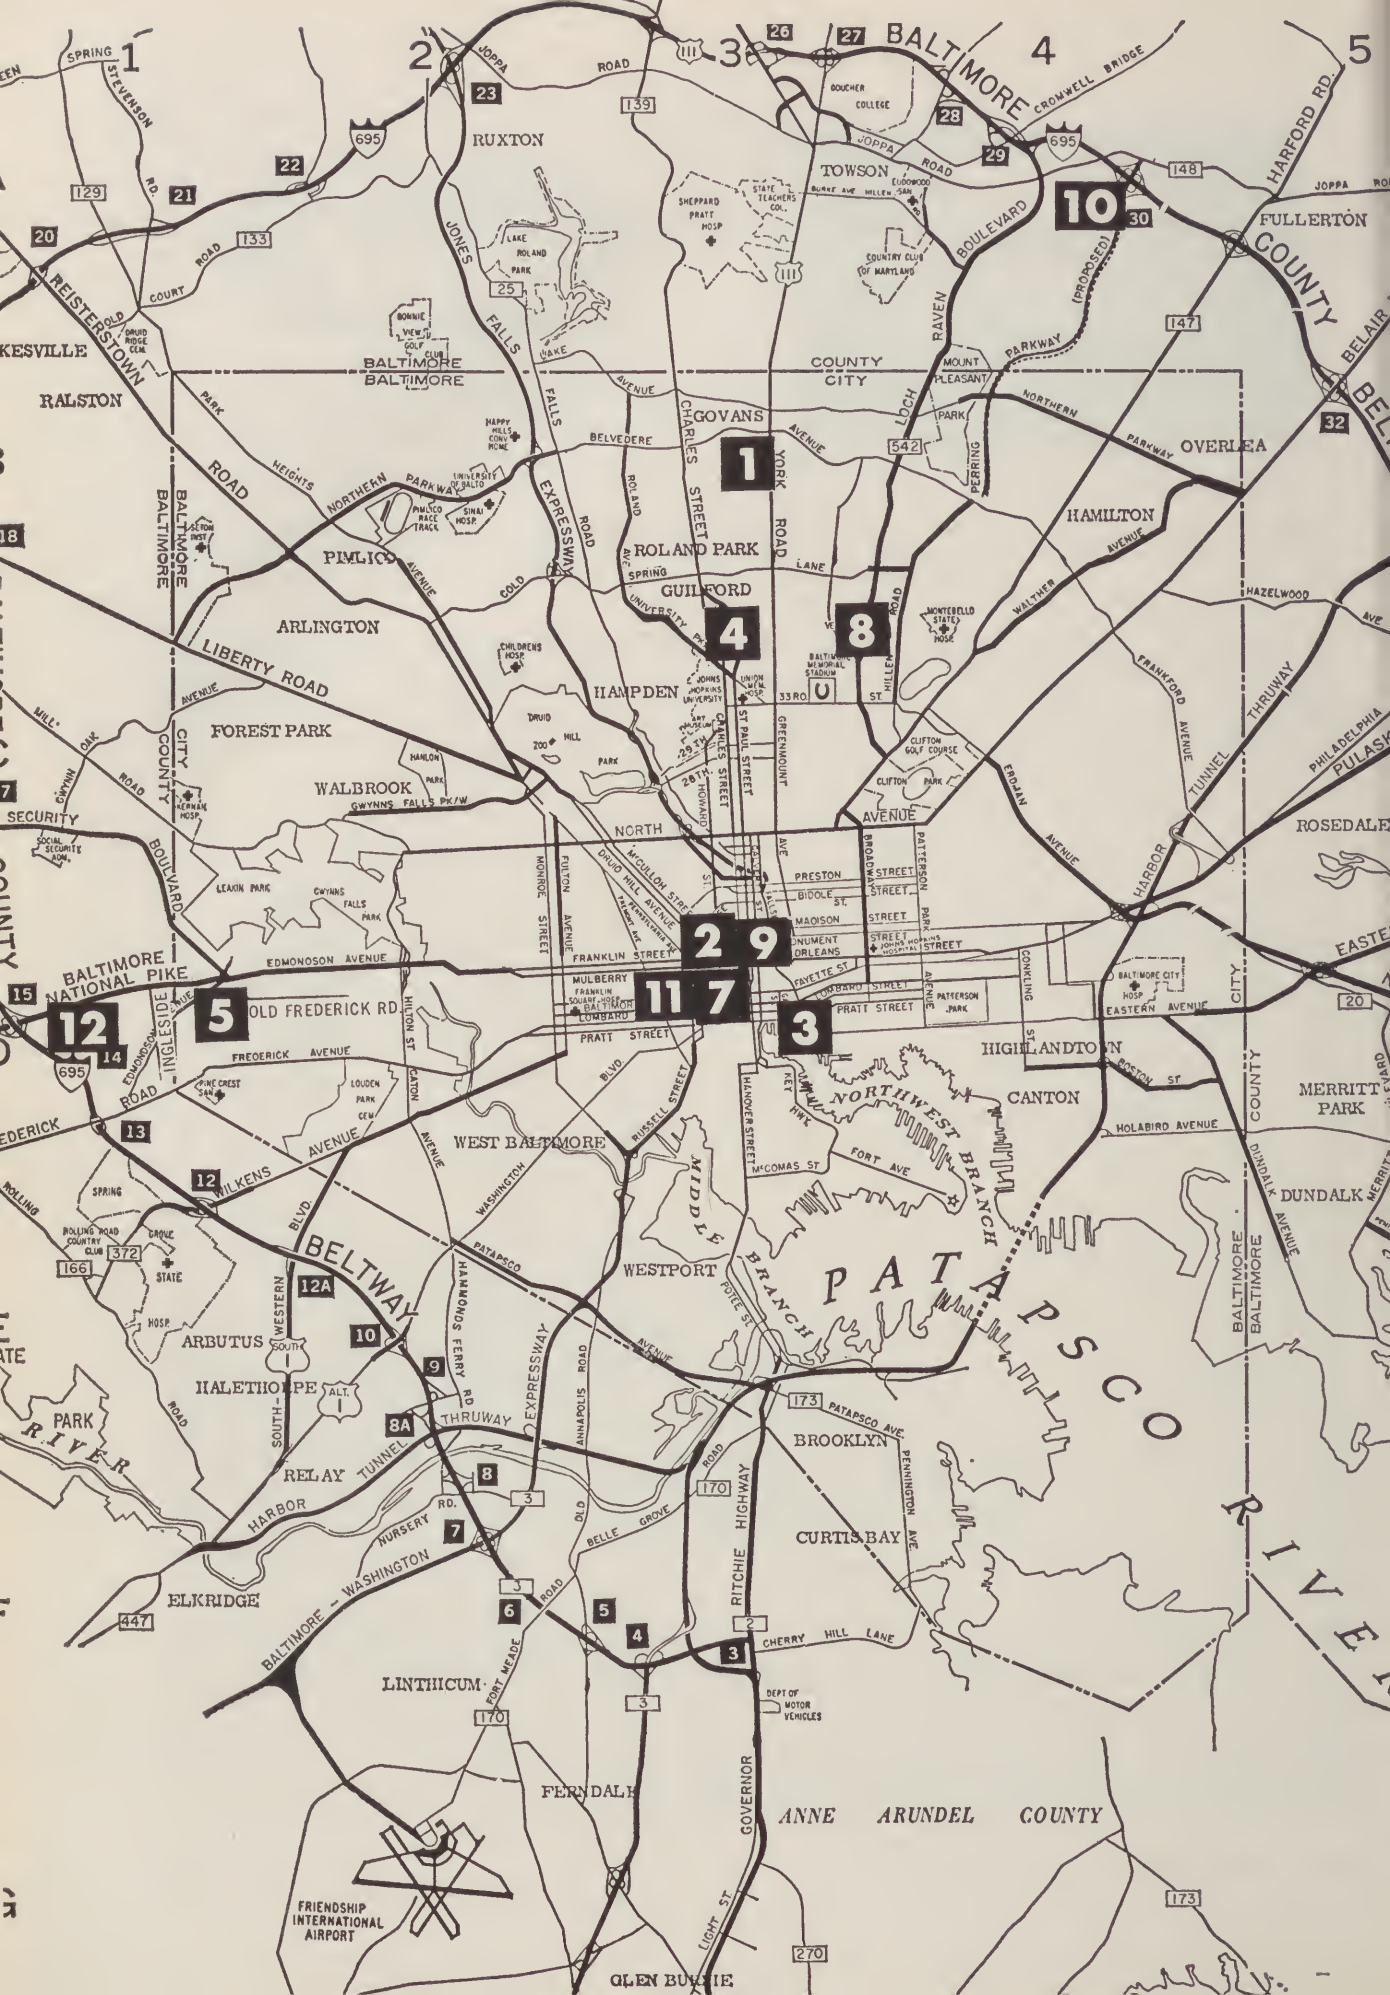
Maryland State department of mental hygiene

On Baltimore's Mental Health Problems and Needs

The continuing increase observed for some time in the number of admissions to Maryland's mental hospitals has been primarily related to the growing need for inpatient treatment by Baltimore city residents. While admission rates have traditionally been higher in the city than in other areas of the state, this gap has widened appreciably in recent years. If presently existing conditions remain unchanged, it must be anticipated that this disparity will increase at an accelerating pace.

ADMISSION RATE *

Fiscal Year	Baltimore City	Maryland Excl. of Baltimore	Four Suburban Counties	Nine Eastern Shore Counties	Ten Other Counties
1963	377.7	150.0	137.3	275.3	139.2
1964	415.3	159.2	143.1	267.7	161.5
1965	457.0	167.1	150.8	295.0	156.8
1966	516.9	177.4	166.7	306.8	186.6
1967	643.1	179.5	171.4	297.9	169.9
1968	714.3	182.8	173.8	294.6	165.4



** Number of admissions per 100,000 estimated population in specified area and year.*

Baltimore's population, as in most urban centers, is virtually stationary in size and accounts for a declining proportion of total state residents. While 28.8% of Maryland's population lived in the city at the beginning of 1963, this decreased to 23.0% by 1968. Despite this, 48.5% of the 7,257 state hospital admissions in 1963 and 54.1% of the 11,997 admissions in 1968 lived within the city confines. A similar upward trend has been noted in psychiatric outpatient units. These data reflect a general pattern of expanding health problems in Baltimore resulting from the white middle-class mass exodus to suburban counties and their replacement in many cases by poor, culturally deprived and community dependent residents.

An earlier report,[1] based on data from the Maryland Psychiatric Case Register, showed that major variations existed also within Baltimore. This study reported that the proportion of the total population admitted to inpatient care (in all public and private facilities) during a three year period (1961-1964) ranged from 0.42% in an outlying area to 8.16% in an inner city tract. Rates for middle class sections in most cases did not differ appreciably from comparable figures for similar areas beyond the city limits. Differences in admission rates between Baltimore and surrounding counties were almost entirely accounted for by the very high rates in inner city slum tracts.

Endeavors to reverse presently existing trends should receive the active support of all state residents since Baltimore and the rest of Maryland are vitally inter-dependent. These efforts require the development and expansion of community-centered mental health services in close coordination with other agencies and programs seeking to overcome the causes and effects of cultural, economic, and social deprivation.

In the complex picture of moderate to severe anxiety...

there is a new reason for prescribing Mellaril (Thioridazine HCl)

effectiveness in mixed anxiety-depression

Long recognized for its usefulness in the treatment of moderate to severe anxiety, Mellaril is now also known to be effective against mixed anxiety-depression.

Often the symptoms of anxiety states are difficult to sort out—even with the most careful probing. The patient may manifest symptoms of agitation, restlessness, insomnia, somatic complaints. But what of the depression that may be mixed in the total picture? It is reassuring to know that Mellaril may be prescribed—with strong possibilities of success—when there is anxiety alone or a mixture of anxiety and depression.

Before prescribing or administering, see Sandoz literature for full product information, including adverse reactions reported with phenothiazines. The following is a brief precautionary statement.

Contraindications: Severe central nervous system depression, comatose states from any cause, hypertensive or hypotensive heart disease of extreme degree.

Warnings: Administer cautiously to patients who have previously exhibited a hypersensitivity reaction (e.g., blood dyscrasias, jaundice) to phenothiazines. Phenothiazines are capable of potentiating central nervous system depressants (e.g., anesthetics, opiates, alcohol, etc.) as well as atropine and phosphorus insecticides. During pregnancy, administer only when necessary.

Precautions: There have been infrequent reports of leukopenia and/or agranulocytosis and convulsive seizures. In epileptic patients, anticonvulsant medication should also be maintained. Pigmentary retinopathy may be avoided by remaining within the recommended limits of dosage. Administer cautiously to patients participating in activities requiring complete mental alertness (e.g., driving). Orthostatic hypotension is more common in females than in males. Do not use epinephrine in treating drug-induced hypotension. Daily doses in excess of 300 mg. should be used only in severe neuropsychiatric conditions.

Adverse Reactions: *Central Nervous System*—Drowsiness, especially with large doses, early in treatment; infrequently, pseudoparkinsonism and other extrapyramidal symptoms; nocturnal confusion, hyperactivity, lethargy, psychotic reactions, restlessness, and headache. *Autonomic Nervous System*—Dryness of mouth, blurred vision, constipation, nausea, vomiting, diarrhea, nasal stuffiness, and pallor. *Endocrine System*—Galactorrhea, breast engorgement, amenorrhea, inhibition of ejaculation, and peripheral edema. *Skin*—Dermatitis and skin eruptions of the urticarial type, photosensitivity. *Cardiovascular System*—Changes in the terminal portion of the electrocardiogram have been observed in some patients receiving the phenothiazine tranquilizers, including Mellaril (thioridazine hydrochloride). While there is no evidence at present that these changes are in any way precursors of any significant disturbance of cardiac rhythm, several sudden and unexpected deaths apparently due to cardiac arrest have occurred in patients previously showing electrocardiographic changes. The use of periodic electrocardiograms has been proposed but would appear to be of questionable value as a predictive device. *Other*—A single case described as parotid swelling.

Mellaril®
(Thioridazine HCl) 25 mg. t.i.d.

for moderate to severe anxiety and mixed anxiety-depression

SANDOZ SANDOZ PHARMACEUTICALS, HANOVER, N. J. 68-169

...now fast relief of hay fever symptoms with

NTZ®

Nasal Spray

When pollens fly, just one or two squirts of NTz in each nostril, followed in a few minutes by a second spraying, shrink swollen nasal passages almost on contact. And breathing comfort follows. The antihistamine component of NTz helps combat the allergic reaction and lessen rhinorrhea, sneezing and itching; its antiseptic wetting agent promotes rapid spread of components.

NTz Nasal Spray affords the well-known benefits of Neo-Synephrine® in a carefully balanced formula which includes:

Winthrop

Neo-Synephrine® (brand of phenylephrine) HCl, 0.5% (adult strength), decongestant
Thenfadil® (brand of thenyldiamine) HCl, 0.1%, antihistamine
Zephiran® (brand of benzalkonium as chloride, refined) Cl, 1:5000, antiseptic wetting agent

Treatments with NTz should be repeated every three or four hours as needed. NTz is for temporary relief of nasal symptoms and overdosage should be avoided. Available in squeeze bottles of 20 ml. and 1 oz. bottles with dropper.

Winthrop Laboratories, New York, N.Y. 10016 (1289)

When it's more than a bad cold

your patient can feel better while she's getting better

Achrocidin®

Tetracycline HCl—Antihistamine—Analgesic Compound

Each tablet contains: ACHROMYCIN® Tetracycline HCl 125 mg.; Phenacetin 120 mg.; Caffeine 30 mg.; Salicylamide 150 mg.; Chlorothen citrate 25 mg.

In tetracycline-sensitive bacterial infection complicating respiratory allergy, ACHROCIDIN brings the treatment together in a single prescription—prompt relief of headache and congestion together with effective control of the organisms frequently responsible for complications leading to prolonged disability in the susceptible patient.

For children and elderly patients you may prefer caffeine-free ACHROCIDIN Syrup. Each 5 cc contains: ACHROMYCIN (Tetracycline) equivalent to Tetracycline HCl 125 mg.; Phenacetin 120 mg.; Salicylamide 150 mg.; Ascorbic Acid (C) 25 mg.; Pyrilamine Maleate 15 mg.

Contraindications: Hypersensitivity to any component.

Warning: In renal impairment, since liver toxicity is possible, lower doses are indicated; during prolonged therapy consider serum level determinations. Photodynamic reaction to sunlight may occur in hypersensitive persons. Photosensitive individuals should avoid exposure; discontinue treatment if skin discomfort occurs.

Precautions: Drowsiness, anorexia, slight gastric distress can occur. In excessive drowsiness, consider longer dosage intervals. Persons on full dosage should not operate vehicles. Nonsusceptible organisms may overgrow; treat superinfection appropriately. Treat beta-hemolytic streptococcal infections at least 10 days to help prevent rheumatic fever or acute glomerulonephritis. Tetracycline may form a stable calcium complex in bone-forming tissue and may cause dental staining during tooth development (last half of pregnancy, neonatal period, infancy, early childhood).

Adverse Reactions: *Gastrointestinal*—anorexia, nausea, vomiting, diarrhea, stomatitis, glossitis, enterocolitis, pruritus ani. *Skin*—maculopapular and erythematous rashes; exfoliative dermatitis; photosensitivity; onycholysis, nail discoloration. *Kidney*—dose-related rise in BUN. *Hypersensitivity* reactions—urticaria, angioneurotic edema, anaphylaxis. *Intracranial*—bulging fontanels in young infants. *Teeth*—yellow-brown staining; enamel hypoplasia. *Blood*—anemia, thrombocytopenic purpura, neutropenia, eosinophilia. *Liver*—cholestasis at high dosage.

Upon adverse reaction, stop medication and treat appropriately.

Lederle

now she can cope...

thanks to

Butisol SODIUM®
(SODIUM BUTABARBITAL)

the "daytime sedative" for everyday situational stress

When stress is situational—environmental pressure, worry over illness—the treatment often calls for an anxiety-allaying agent which has a prompt and predictable calming action and is remarkably well tolerated. BUTISOL SODIUM (sodium butabarbital) meets this therapeutic need.

After 30 years of clinical use . . . still a first choice among many physicians for dependability, safety and economy in mild to moderate anxiety.

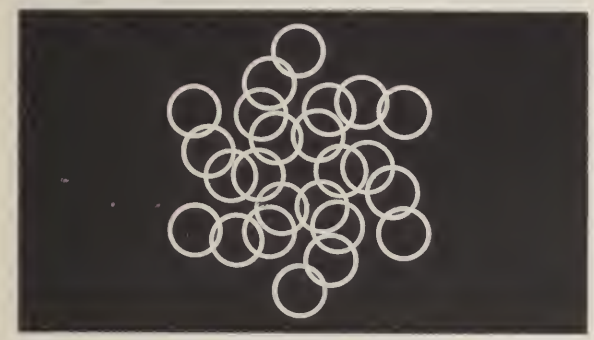
Contraindications: Porphyria or sensitivity to barbiturates.

Precautions: Exercise caution in moderate to severe hepatic disease. Elderly or debilitated patients may react with marked excitement or depression.

Adverse Reactions: Drowsiness at daytime sedative dose levels, skin rashes, "hangover" and systemic disturbances are seldom seen.

Warning: May be habit forming.

Usual Adult Dosage: As a daytime sedative, 15 mg. (¼ gr.) to 30 mg. (½ gr.) t.i.d. or q.i.d.



Available for daytime sedation: Tablets, 15 mg. (¼ gr.), 30 mg. (½ gr.); Elixir, 30 mg. per 5 cc. (alcohol 7%).

BUTICAPS® [Capsules BUTISOL SODIUM (sodium butabarbital)] 15 mg. (¼ gr.), 30 mg. (½ gr.).

McNEIL

McNeil Laboratories, Inc., Fort Washington, Pa.

From the Subcommittee on Alcoholism of the Medical and Chirurgical Faculty of the State of Maryland

alcoholism section

The Alcoholic in the Emergency Room

Alcoholics are being examined and treated at an increasing rate in hospital emergency rooms throughout the state. Under Maryland law, the medical services of the general hospital are expected to care for the needs of the intoxicated patient, without discrimination, in accordance with the accepted standards applying to other presenting patients. However, because of the stigma associated with alcoholism and because of the lack of training of medical students and nurses in this disease, the alcoholic is often treated improperly.

This paper discusses the important principles of emergency treatment of alcoholics. The many medical and surgical complications are beyond its scope, so that only acute intoxication and acute withdrawal syndromes will be considered. The paper concludes, however, with a discussion of the nature of the follow-up which is so necessary to prevent the "revolving door."

RICHARD H. ANDERSON, MD
Assistant Resident in Department of Medicine
University of Maryland Hospital

MAXWELL N. WEISMAN, MD, Director
Division of Alcoholism Control
Maryland State Department of Mental Hygiene

Acute alcohol intoxication, when mild to moderate, usually requires no treatment for recovery other than time to "sleep it off" and to suffer through the hangover. If the intoxicated patient has a home to go to, a family to care for him, and if his intoxication is uncomplicated and of recent onset, he should be sent home without medical treatment. However, the homeless alcoholic who presents to the emergency room without complications is rare, and further evaluation, in his case, is usually indicated. Often, the withdrawal syndrome has begun, or will begin, while he is in the emergency room and then he should be treated accordingly.

Certain individuals who consume relatively small amounts of alcohol will become aggressive, destructive, and severely agitated, but they are rare. This condition, usually referred to as pathological intoxication, may be due to underlying emotional disturbance. The patient should be restrained, if necessary, and carefully sedated to prevent him from harming himself and others. Once the alcohol is eliminated, the patient's behavior will usually return to normal, at which time he should be urged to seek psychiatric treatment and abstain from alcohol.

Stupor from alcohol is common and requires only observation and careful differentiation from the many other causes of stupor. Sedation or use of tranquilizers should be avoided because of possible potentiation of alcohol and precipitation of coma. The blood-alcohol level may be helpful in this regard, but should not be relied upon entirely to differentiate alcohol stupor from other conditions because of the frequent occurrence of concomitant head trauma and infection in the alcoholic.

Alcohol coma is quite rare, but is an emergency because of the possibility of respiratory depression and death. The condition is completely reversible if the patient is supported correctly until the blood alcohol level decreases. It is important to rule out other causes of coma as soon as possible through a history (from friends or family), and physical and laboratory studies with particular emphasis on blood sugar, alcohol and barbiturate levels. An endotracheal tube should be inserted and respiration assisted

if there is any respiratory embarrassment. Gastric lavage may be helpful, but not until after an endotracheal tube is inserted because of the possibility of aspiration. A variety of drugs such as, glucose, insulin, and stimulants have been used, but without particular value and we feel they are not indicated. Some clinicians, however, recommend a 50 cc amp. of 50% glucose IV without waiting for results of blood studies in order to prevent possible brain damage in the event of hypoglycemic coma (see below). Hemodialysis may be useful, but its value has not yet been established.

The *withdrawal syndromes* are easily recognized, but their severity is often underestimated and treated incorrectly. The severity of withdrawal is dependent on several factors: the duration of intake, the amount of alcohol ingested, the abruptness of cessation, and individual susceptibility. The cause of the withdrawal syndrome is not clear, but is felt by most investigators to truly represent withdrawal from alcohol. The condition may develop while the alcoholic is drinking if the blood-alcohol level is decreasing, as in "tapering-off," or it may occur several days after complete cessation of alcohol intake.

Alcohol withdrawal may be separated into several syndromes which simply reflect degrees of severity:

The *tremulous stage* is the mildest form of withdrawal. The most common signs and symptoms are tremors, insomnia, anorexia, anxiety, depression, nausea, vomiting, flushed facies, injected conjunctiva, tachycardia and agitation. This state often will subside in several days with abstinence, with another drink, or with mild sedation, or it may progress to delirium tremens.

The *acute hallucinosis stage* usually includes the signs and symptoms of the tremulous stage; but, in addition, hallucinations are present: visual, auditory, or tactile. Characteristically, the hallucinations are threatening and unpleasant, but occasionally may be pleasant. Usually, they are transitory, as is the tremulous stage, but occasionally may last for several months. Chronic hallucinosis in the alcoholic is thought, by many, to represent schizophrenia, but the, frequently, very late age at onset makes this assumption doubtful.

Delirium tremens is a medical emergency requiring immediate hospitalization and treatment. The mortality rate ranges from 5% to 30% with death resulting from peripheral vascular collapse, hyperthermia, and associated infection or head trauma.[1-3] Delirium tremens should not be diagnosed, unless there is evidence of the tremulous state, hallucinations, disorientation at least intermittently, and delirium. The autonomic activity is extreme, with frequent fever, profuse perspiration, tachycardia, tachypnea, and severe agitation. Convulsions ("rum fits") are not uncommon in patients with no previous history of convulsive disorder. Why convulsions occur during alcohol withdrawal is unknown, but they may represent a predisposition to epilepsy which is made manifest by the alcohol withdrawal.

The diagnosis of the withdrawal state is usually made without difficulty, and laboratory studies are of little value in confirming a clinical impression. However, it should be remembered that alcoholics frequently develop medical and surgical conditions, directly and indirectly related to their alcoholism. Consequently, a CBC, urinalysis, blood-sugar, blood-urea-nitrogen, chest X-ray, and skull X-ray are often indicated. In addition, although fever is common in delirium tremens, a careful search for infection should always be made in a febrile alcoholic, and treatment with antibiotics should be initiated immediately after cultures are obtained if an infection is suggested.

Treatment of the withdrawal syndrome is rather controversial, and a review of the medical literature will reveal that a variety of approaches have been used. Virtually every sedative and every tranquilizer has been tried at one time or another. What follows is a suggested regimen which we have found most useful. Each withdrawal stage is treated with the same general measures but, obviously, mild withdrawal requires little treatment, while severe withdrawal requires additional measures.

Sedation is the most important step in treatment and often the most difficult to achieve. A variety of drugs are available and effective, and the physician should use the drug with which he is most familiar. We prefer the minor tranquilizers such as, chlordiazepoxide *(Librium)* and hydroxyzine *(Vistaril)* because of the relatively minor risk of oversedation, addiction, seizure potentiation, and hepatic toxicity. The dosage required to produce sedation (without stupor) varies from 50 to 200 mg IM of chlordiazepoxide or hydroxyzine which may have to be repeated in 2 to 4 hours. Once sedation is achieved, the dose should be reduced to that level which will maintain relative tranquillity (10 to 25 mg q.i.d.) and given per os. Although mild to moderate withdrawal may be treated rather effectively in a few hours to a few days, failure to continue tranquilizers may increase the likelihood of return to alcohol with the patient's attempt to control the symptoms of withdrawal. However, we suggest that only a minimum dose of tranquilizer be supplied to carry the patient over to outpatient services. This is of vital importance, because of the likelihood of dependence upon the tranquilizer and potentiation with alcohol, a particularly dangerous and, possibly, lethal condition for an alcoholic who continues to drink.

Large amounts of fluids given intravenously or orally, and electrolyte replacement have frequently been advocated in treating the withdrawal syndrome,

because of the apparent dehydration of the alcoholic and the known diuretic properties of alcohol. However, investigators have shown recently that there is a rise in total body water with daily ingestion of alcohol, and that alcohol is diuretic, only when the blood-alcohol level is rising.[4, 5] They have shown also that, frequently in the withdrawal period, alcoholics are not dehydrated, but overhydrated. Consequently, in the absence of complications, fluids given intravenously are probably not indicated. In fact, some investigators use diuretics in the treatment of withdrawal. We do not, however, suggest their use at this time since the data attesting their effectiveness are not completely convincing, although their use in the future may be anticipated.

Rarely, however, the alcoholic will present with hypoglycemia either from glycogen depletion in the liver, and malnutrition, or from some direct effect of alcohol not yet clearly understood. Therefore, it is suggested that glucose be given immediately, either orally or intravenously, to the alcoholic in withdrawal period.

It is a well-established fact that a high percentage of chronic alcoholics have a low serum magnesium,[6, 7] and that, with abstinence from alcohol and a normal diet, the magnesium will return to normal in a few days. It has also been shown experimentally that magnesium deficiency will produce many of the signs and symptoms of alcohol withdrawal.[8] Furthermore, the sedative effect of magnesium has been utilized for many years in the treatment of toxemia of pregnancy. For these reasons, many investigators have suggested the use of magnesium sulfate in the treatment of alcoholics.[9-11] Even though there is no conclusive evidence that magnesium alters the course of delirium tremens, we routinely recommend magnesium sulfate 50% solutions 2cc IM q6h for 1 to 2 days.

Others have suggested the routine use of anticonvulsants in the severe withdrawal syndrome to prevent "rum fits.[12] We use anticonvulsants routinely in all patients with a history of seizures, and initiate anticonvulsants in any patients who convulse.

Vitamins are important in the treatment of alcoholism, not because they will alter the course of withdrawal, but because of the multiple vitamin deficiencies so common among alcoholics. The physician has a choice of a large variety of available multiple vitamin preparations. Because of frequent thiamine deficiency, we suggest at least 100 mg of thiamine be given in addition to other vitamins.

Finally, continuous supportive nursing care is essential to alleviate the overwhelming anxiety and fear which is often present. The room should be well-lighted and quiet, and include the presence of a calm member of the family or of Alcoholics Anonymous. Physical restraint should be avoided since this may only increase the patient's fright in rendering him helpless in the face of his monstrous hallucinations, hence more hostile and even combative.

Follow-up. The emergency room is frequently the first, and often the only, point of contact an alcoholic has with medical personnel responsible for the evaluation of his alcoholism or its complications. The Maryland law gives the medical officer of the unit the authority to determine whether the patient should be directly admitted to the hospital for further evaluation and detoxification or other treatment, or referred to another appropriate facility for care and treatment, or denied referral or admission.

The physician in the emergency room is expected to care for the acute medical need, and then to arrange for follow-up when necessary, as in all other chronic illnesses. Whether or not the patient will embark on a long-range program to achieve sobriety and minimize relapses often depends on the positive relationships established in the emergency room.[13] Here, three attributes of the staff, as a whole, are crucial:

1. A non-judgmental attitude characterized by a genuine professional acceptance of the patient as suffering with an addictive illness, and
2. A thorough knowledge of the dynamics of alcoholism as a complex, socio-medical illness so that an objective evaluation can be made of the patient's needs and capacity for recovery, and
3. Knowledge of other agencies involved in follow-up care.

In the medical setting of a hospital where the staff, uniformly, is genuinely convinced that alcoholism is a disease and communicates this concept both verbally and nonverbally, the alcoholic patient may, himself, perhaps for the first time in the history of his illness, emerge from the hopelessness and despair which serve, often, to frustrate the physician's therapeutic regimen. The most degraded alcoholic, if treated consistently with the same dignity which is accorded the victim of any other illness, may find this professional relationship the turning point in overcoming his feelings of rejection and defensive denial of his alcoholic problem. This, however, requires a deep-seated understanding that the alcoholic is not "responsible" for his illness, that he "cannot help" his alcoholism any more than a diabetic is responsible for or can help his diabetes. Neither one, contrary to popular prejudice, is a self-inflicted disease. Both patients, however, can and should be helped to understand the nature of their illness and made responsible for a course of action which can keep them symptom-free, even though neither one may ever be "cured."

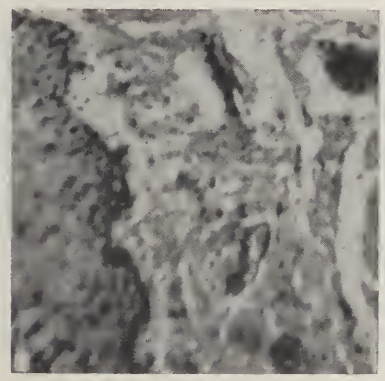
Experience in the emergency room indicates that just such a relationship of trust and confidence is closely correlated with the success of further referral to a follow-up program. Such referral will

vary, depending not only on the patient's need, but also on the extent and availability of alcoholism treatment resources within the private or public health sectors of a given community. Where no resources are known and where there is no family physician, the patient should be referred to the local public health officer who is responsible for community programs for treatment, prevention, and control of alcoholism.

While the most effective and most experienced community resource often is the local AA group, together with the associated fellowships of Al-Anon for the spouse and Al-Ateen for the children of the alcoholic, other agencies may also be of help. Visiting nurses, clergymen, staffs of family and social agencies, employers and union counselors, halfway houses, state hospital alcoholic rehabilitation units, vocational agencies, the local council on alcoholism and numerous others, may each have a role to play at various stages of the illness, in helping the alcoholic maintain sobriety. An alcoholism counselor, who may be employed on the emergency room staff, is usually equipped with knowledge of these resources and often the most helpful agent in effecting the referral.

Provided the patient does not object, the law requires that a bona fide attempt be made to notify his immediate family or next of kin. In addition, if for any reason, the patient must receive treatment elsewhere, arrangements for the treatment, together with transportation, must be made. If the patient is without funds, arrangements for transportation to his residence or elsewhere are a hospital responsibility. Further, if he has no residence, an attempt must be made to find and transport him to a facility where he may find shelter. Hospital social service, or the alcoholism counselor, when available, may appropriately be concerned with these alternative arrangements.

Under the law, if the patient is thought by the physician to be unable to make a rational decision concerning his own welfare, he may be admitted and detained involuntarily for treatment purposes until he is no longer intoxicated or incapacitated but, in any event, no longer than 5 days. An additional section of the law allows the patient to be kept for treatment for a period not exceeding 30 days, but it is most unlikely that this provision will be invoked since the patient can, if necessary, be sent to the state mental hospital following detoxification.



It may be assumed that the alcoholic is seen in the emergency room when he is in serious difficulty and in need of help. The physician who sees him can make a positive contribution to the medical management of this acutely intoxicated individual, but he is not expected to do the total job involved in the care of the alcoholic. All in all, he plays an indispensable role in Maryland's comprehensive program for the prevention, control, and treatment of this complex disease.

Renal Biopsy

Until comparatively recent times the pathologist has been dependent on material obtained at autopsy to formulate his ideas on renal disease. With few exceptions, this, of necessity, represented end-stage disease, and a good deal of speculation and clairvoyance was required to determine the sequence of events in the evolution of a given disease.

The renal biopsy has afforded us the opportunity of studying the early stages of renal disease, as well as allowing us to study the non-lethal diseases that affect the kidney. The early biopsies were obtained at the same time as operation for the relief of hypertension—usually sympathectomy—but the information from these was confined to a study of vascular changes in hypertension. The needle biopsy was introduced by Perez Ara [1] and by Iversen and Brun,[2] and since those early days many thousands of needle biopsies have been performed with low morbidity and mortality in a wide variety of conditions.

ROBERT H. HEPTINSTALL, MD
Director, Department of Pathology
The Johns Hopkins University School of Medicine

The needle biopsy is usually performed by the internist, and the technical details need not concern us in this short article. Let it suffice to say that the procedure is carried out with a Vim-Silverman needle or modification thereof, with the conscious patient in the prone position. Certain contraindications ought to be appreciated, chief among which are the presence of only one kidney, severe bleeding diathesis, suspected malignancy, and very high blood pressure. The last of these is probably a relative contraindication, for biopsies have been performed in severe hypertension with no untoward effects. Severe acute renal failure is considered a contraindication by some, but there are many instances of successful biopsy being performed in this state.

The material obtained should be fixed immediately, and buffered formalin or Helly's fluid are both acceptable. The tissue should be treated with care and not processed with the uterine fibroids and other large pieces of tissue. Paraffin sections should be cut as thinly as possible, and while many claim that two micron sections are necessary, accurate diagnosis can be made on more easily attainable four micron sections. Sections are stained with hematoxylin-eosin and many other stains if required. A small piece can be removed from the main cylinder of tissue for processing for electron microscopy. This is usually fixed in glutaraldehyde and then in osmium tetroxide, prior to embedding in one of the epoxy resins. Fluorescence microscopy to demonstrate immunoglobulins, beta 1C globulin (a component of complement), and fibrogen can also be used, but an additional piece of tissue is really necessary. Cutting a single cylinder of tissue for light, electron, and fluorescence microscopy usually leads to traumatization of the tissue, or to the frustration of having processed material with no glomeruli present.

The reason for performing a renal biopsy is to establish a definite diagnosis. This is desirable for many reasons. In the first place, it enables one to

institute rational therapy. For example, in the nephrotic syndrome, a patient with "minimal change" lesion (lipoid nephrosis) might be expected to respond to steroid therapy, whereas a patient with a virtually identical clinical picture, but with the biopsy showing idiopathic membranous glomerulonephritis, will not. Second, some idea of prognosis may be obtained, the long term prognosis of lipoid nephrosis being better than that of idiopathic membranous glomerulonephritis. In a patient with sudden onset of renal failure, the biopsy will enable one to differentiate between the florid forms of glomerulonephritis and acute tubular necrosis; in the former, long term dialysis or transplantation will prove necessary, whereas in the latter, conservative therapy or short term dialysis may be life saving. Third, the pathology of non-fatal disease may be studied; e.g., some of the cases of benign recurrent hematuria have been shown to be associated with a focal form of glomerulonephritis, a similar pathological picture also being found as the renal manifestation of Schönlein-Henoch Syndrome. Finally, it is only by the extended use of the renal biopsy that we are likely to learn about the natural history of renal disease. Already great insight has been gained into the evolution of acute poststreptococcal glomerulonephritis and systemic lupus erythematosus.

Electron microscopy and immunofluorescent techniques have revealed features of disease, as yet not fully appreciated; e.g., in idiopathic membranous glomerulonephritis, the apparent basement thickening is really an accumulation of material outside the basement membrane proper. The electron dense deposits on the outside of the lamina densa, seen in the poststreptococcal glomerulonephritis, the so-called humps, have been defined with certainty by electron microscopy, although it should be remembered that the careful pathologist had noticed them with light microscopy. More importantly, the deposits have been shown to correspond to the nodular foci of fluorescence using tagged antibody to immunoglobulins and beta 1C globulin, strongly suggesting that they represent antigen-antibody complexes. Other important concepts of pathogenesis are being enunciated with the aid of these techniques.

The renal biopsy, then, is an important tool for the practitioner specializing in renal disease, and for the investigator grappling with more fundamental problems. Renal biopsy should not be entertained lightly, for there is a definite morbidity, greatest among those who only practice the method occasionally. Intelligently used, it should provide us with answers to long standing problems over the years to come.

Advances in Medical Libraries

On receiving our copy of the *University of Virginia Medical Center Serial Holdings* with the promise that it is the first stage in a project which will produce a list of serial holdings of all the major, medically-oriented libraries in Virginia, we were reminded of our debt to the computer which is making all this possible. Of course, the computer was assisted by library personnel and by federal resource grants under the Medical Library Assistance Act of 1965. After the recognition has been given to all involved, those who search for information and seek to obtain it can join in a quiet cheer for the progress that is being made in this area. Virginia may be one of our closest sources, but New York city is not really very far, and there, with the help of the *Union Catalog of Medical Periodicals* of the Medical Library Center of New York, may be located 25,000 medical and paramedical periodicals held by 70 libraries in the New York metropolitan area. A bonus is found in the fact that the Virginia project is based on the New York catalog and follows the same rules of entry and bibliographical form, which makes life easier for all who use the reference tools. Happy hunting!

International and American Library Meetings—1969

The International Congress for Medical Librarianship met in Amsterdam, Holland, in May, and the Special Libraries Association, which includes United States and Canadian libraries, met in Montreal, June 1-6, 1969. The Congress brought together librarians from all over the world, all with the prime purpose of pooling ideas for improving medical libraries and services universally. Special Libraries Association brings the subject closer home and promotes cooperation between all fields in special librarianship. Subsequent issues will enlarge on these proceedings.

RESERVE SEPT. 4-6
FOR THE FACULTY'S
SEMIANNUAL MEETING IN
HERSHEY, PA.
PLAN TO ATTEND!

Dear Doctor, You made me what I am today— a whole lot slimmer!

TEPANIL—the right start in support of th weight-control program *you* recommend. reduces the appetite. Doesn't kill it. Weigh loss is significant—gradual—yet there is relatively low incidence of CNS stimula tion. Because TEPANIL works on th appetite, not on the "nerves."

Contraindications: Concurrently with MAO inhibitors, in patient hypersensitive to this drug; in emotionally unstable patient susceptible to drug abuse.

Warning: Although generally safer than the amphetamine use with great caution in patients with severe hypertension severe cardiovascular disease. Do not use during first trimester pregnancy unless potential benefits outweigh potential risks.

Adverse Reactions: Rarely severe enough to require discontinuation of the apy, unpleasant symptoms with diethylpropion hydrochloride have been reporte to occur in relatively low incidence.

As is characteristic of sympathomimetic agents, it may occasionally cause CNS effects such insomnia, nervousness, dizziness, anxiety, and jitteriness. In contrast, CNS depression has bee reported. In a few epileptics an increase in convulsive episodes has been reported.

Sympathomimetic *cardiovascular effects* reported include ones such as tachycardia, precordi pain, arrhythmia, palpitation, and increased blood pressure. One published report describe T-wave changes in the ECG of a healthy young male after ingestion of diethylpropion hydr chloride; this was an isolated experience, which has not been reported by others.

Allergic phenomena reported include such conditions as rash, urticaria, ecchymosis, and erythem

Gastrointestinal effects such as diarrhea, constipation, nausea, vomiting, and abdominal discon fort have been reported.

Specific reports on the hematopoietic system include two each of bone marrow depressio agranulocytosis, and leukopenia.

A variety of miscellaneous adverse reactions have been reported by physicians. These includ complaints such as dry mouth, headache, dyspnea, menstrual upset, hair loss, muscle pai decreased libido, dysuria, and polyuria.

Convenience of two dosage forms: TEPANIL Ten-tab tablets: One 75 mg. tablet daily, swallowe whole, in midmorning (10 a.m.); TEPANIL: One 25 mg. tablet three times daily, one hour befo meals. If desired, an additional tablet may be given in midevening to overcome night hunge Use in children under 12 years of age is not recommended.

Tepanil® Ten-tab®

(continuous release form)

(diethylpropion hydrochloride)

rehabilitation notes

Rehabilitation of Patients Suffering from Fracture of the Hip*

Part I: Introduction and General Considerations

The need to rehabilitate patients suffering from fracture of the hip is of utmost importance to the patient, his family and his physician.

The cause is usually an accident, thus, a sudden, unplanned event. Frequently, complications compound an otherwise simple problem; as other injuries may accompany the hip fracture. In many elderly patients, the events may be poorly tolerated because of the precipitation of generalized metabolic, nutritional, psychological, and physiological decompensations.

JOHN D. HSU, MD
Div. Orthopaedic Surg., Dept. Surg.
Baltimore City Hospitals and
Johns Hopkins Medical Institutions

Objectives

The object of rehabilitation is to have the patient become as independent as possible and yet to protect the affected lower limb. The ideal situation would be to restore the patient to his previous and pre-injury state and condition. However, this may not always be possible.

At the time of hospitalization, two goals need to be considered: They are:

1. The discharge from the hospital; and 2. The maximum amount of independence that can be attained by the patient.

The former is achieved by discharge planning and consideration of the problems of after-hospital care. Arrangements have to be made with the patient, his family, and his relatives. The help of members of his community may be needed. The social service department should be given an active part. The physician-in-charge sets up guidelines and advises on all phases necessary to make the problem better understood by all concerned.

The amount of independence allowed may depend on the various medical factors, of which the physician's assessment of the stability of the fracture fixation is very important. With careful follow-up, it is hoped that improvement will continue, making the rehabilitative regimen progressive until the fracture has healed sufficiently and satisfactorily so that the patient can once again resume as much of his pre-injury activities as possible.

The Team Approach

In the planning of rehabilitation, a multi-disciplinary approach should be taken. This is especially necessary in the older age group where the need for "Teamwork" and understanding of the problems by interested persons and their staffs is vital. The problems will involve the following services and their respective members.

I. The medical staff, the physician-in-charge, his consultants, and members of the hospital house-staff.

* *Supported in part by an American Geriatrics Society Award and USPHS Grant No. 5T1 GM00624-08.*

II. The nursing staff; the head nurse on the ward, her nursing personnel and para-nursing personnel.

III. Physical therapy department with the physiatrist acting as the consultant, his staff of physical and occupational therapists.

IV. Social service department.

V. Rehabilitation counselors, community services and other interested para-medical and voluntary personnel.

The integration of all the different disciplines will provide better over-all care for the patient. This ensures better communication between services to avoid confusion and the duplication of efforts. Such an approach may facilitate the understanding of the patient's disability by the medical and nursing professions as well as paramedical personnel.

Certain problems involving the different disciplines may be minor in certain patients but can become a major factor in others. As an example, in younger patients, better communication, reassurance, and temporary financial relief for the family may be necessary. On the other hand, a patient in the older age group may be more apprehensive, require more supervision of his activities, more help and training in physical therapy to get about, or may require certain aids and more integrated medical care for rehabilitation over a longer period of time.

The relationship between members of the rehabilitation team can be as loose or as close-knit as the attitudes of different persons will allow, but one should not forget that the concept of the attending physician-in-charge, and his responsibility to his patient should still be recognized as the basic principle of such management.

The Important Role of the Physical Therapy Department in the Rehabilitation Program

The physical and occupational therapists play a very important role in helping the patient gain independence.[1] The need for a person to move about is important. A patient recumbent in bed, because of trauma or disease, is prone to develop negative nitrogen balance.[2] Being able to get the patient out of bed not only helps with nursing care but it also contributes to better breathing.[3] Active exercises to keep the muscles of the body from disuse are important, although atrophy is not a major factor if therapy is instituted early. The gradual placing of the patient in an upright position using a tilt-table after a period of recumbency helps physiological adjustments and can be the start of a progressive program whose rationale is one of decreasing dependency geared to individual needs.[4]

The teaching of the maintenance of balance is especially important in an elderly, apprehensive person. If this is achieved, then rapid progress can be made. Balancing and walking aids are most helpful when they are properly selected and perhaps even adapted to certain conditions.[5, 6] The Physical Therapy objectives as described by Patton et al,[7] and Hirschberg [8] and the regimen followed by Cocchiarelli and Yue [9] to restore function and improve the patient's well-being, are examples of the progressive nature of the program that is in common use today. The Occupational Therapy goal, described by Riccitelli,[10] to "promote the social welfare of the aged person by retraining them to their highest possible level of mental and physical activity . . ." deserves consideration.

Evaluation

A regimen of progressive rehabilitation requires an evaluation of the patients' capabilities from a rehabilitative standpoint. Postoperative clinical assessment with periodic radiographic examinations for the maintenance of fracture position and the demonstration of the laying down of callous by the healing tissues, interpreted in the light of our current scientific knowledge of the healing of fractures, are important.[11] In addition, tests for the capability of carrying out postoperative rehabilitation activities and assessment of the mental and emotional capacity of the patient must be taken into account for the setting up of realistic goals. At the Baltimore City Hospitals, we have combined the Mental Status Check List (MSCL),[12] following Lifshitz's [13] principles and the Activities of Daily Living (ADL)[14] tests as an aid in the planning of a rehabilitative program to follow the progress and to make changes in the treatment program.

One of these disposables comes prefilled.
Its unit dose – in nonreactive glass
cartridge – is premeasured.
The cartridge is clearly labeled:
drug name, strength, control number.
Even expiration date where appropriate.

You're more confident that the patient gets...

. . . just what the doctor ordered with the Tubex Closed Injection System.

Injections with the Tubex system are as easy as 1, 2, 3,

1. Select—from an extensive variety of prefilled Tubex sterile cartridge-needle units.* No multi-dose vials to bother with; no unlabeled syringes to cause confusion.

2. Inject—with a minimum of pain. Thanks to the single-use, stainless-steel needle that's both ultra-sharpened and siliconized. Aspirate simply and conveniently.

3. Throw away—empty cartridge-needle unit. Never used again, it can't transmit infection. And there's no clean-up job.

*For injectables not yet in the ever-expanding prefilled Tubex line, empty sterile cartridge-needle units are available.

Wyeth Laboratories Philadelphia, Pa.

New Professional Practitioner:

The Pediatric Associate

Two of the nation's larger philanthropic foundations, Carnegie Corporation of New York and the Commonwealth Fund, recently announced support of an experimental program to prepare a wholly new type of professional practitioner in medicine: a Pediatric Associate who, working under the supervision of a physician, will be qualified to examine and immunize well children and treat the more common childhood diseases.

The purpose of the project is to demonstrate one new method of providing more and better care to our nation's burgeoning child population in spite of the national shortage of pediatricians and others who care for children. The project will be conducted by the University of Colorado School of Medicine, under the direction of Dr. Henry K. Silver, professor of pediatrics and chief architect of the new curriculum. Graduates of the program will receive a bachelor of arts degree from the University of Colorado.

The Role of the Pediatric Associate

The responsibilities envisioned for graduates of the curriculum—who will be termed Pediatric Associates—are based not on the nursing role, but on the physician's role. Hence, the associate will have a substantial degree of medical responsibility for the physician's patients.

The associate will make diagnoses and decide on and carry out appropriate measures for treatment. This will include the writing of prescriptions—exclusive of narcotic compounds—from an approved list of drugs. Thus, the associate will be equipped to take part in all dimensions of the physician's practice. The same wide level of responsibility will apply to associates employed under doctors in the public-health services.

The limits of the associate's medical-practice activities, however, will be clearly defined both legally and professionally.

With the backing of the Colorado State Medical Society, the State Chapter of the American Academy of Pediatrics, and other responsible medical bodies, legislation has been proposed setting forth the terms governing the required education and permissible scope of activities of this new health professional. The legislation will require that graduates of the associates curriculum be examined and certified by the Colorado State Board of Medical Examiners.

Design of the Experimental Curriculum

The experimental curriculum has been designed to lead to professional qualification five years after high school, including a year of internship. It is a joint program between the university's main campus in Boulder and the School of Medicine in Denver. The university and the school have assigned leadership in the effort to the Department of Pediatrics, and an advisory committee with representation from Colorado medical societies and state and local government health agencies has been appointed to guide the Department in development of the curriculum.

Students interested in the program will spend their first two years of the five-year course at Boulder—or other undergraduate schools of their choice—taking liberal arts offerings and essential premedical studies, such as organic chemistry, biology, and mathematics. Dr. Silver, director of the program, and other members of the faculty, will keep in touch with them during this period, working with the student-counseling staff of the University of Colorado and conducting seminars on broad aspects of medical practice.

Students accepted for training as Pediatric Associates will transfer to the University of Colorado Medical Center for three years of intensive professional education.

The first year of the professional-education phase will be devoted to a concentrated, 48-week sequence of studies in the basic sciences. The emphasis here will be on the relevance of these fields to understanding both the normal and the disease states of physiological systems. For example, anatomy and physiology will be combined in the study of the cardiovascular system, and will be followed by combined studies of heart and vascular pathology and related clinical diagnoses.

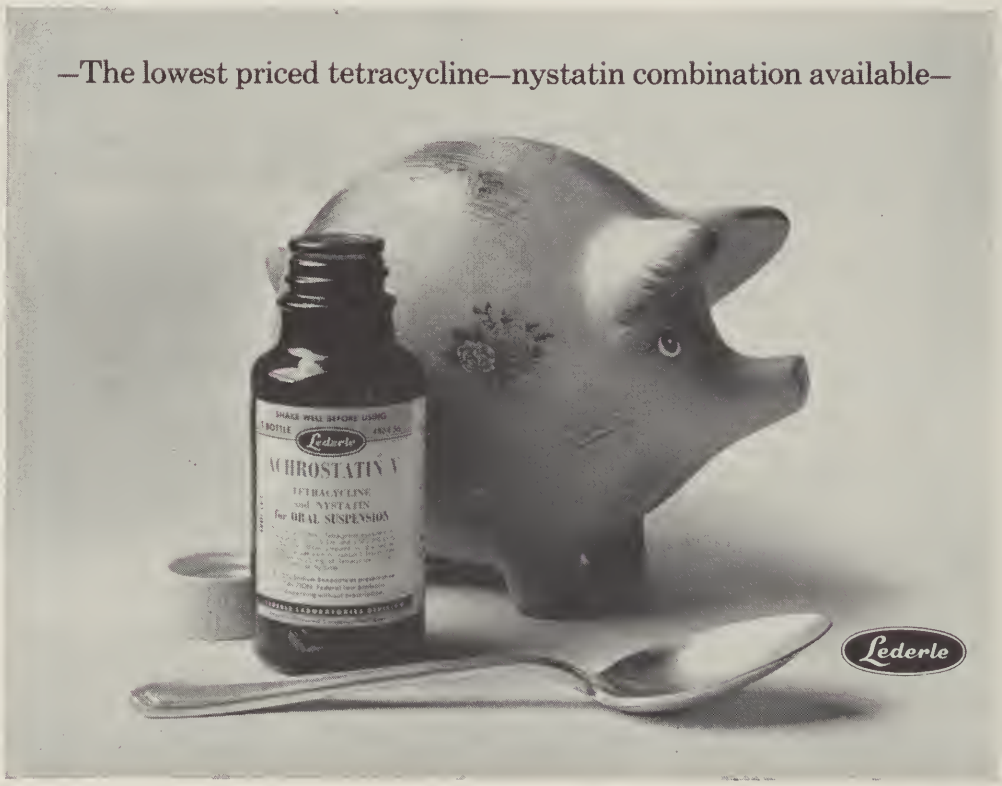
The second year, also 48 weeks, will be devoted to fundamental clinical training and will consist of a clerkship experience similar to that provided for medical students. Along with medical students, the students in the Pediatric Associate course will gain

experience in history taking, performing complete physical examinations, and in ordering, carrying out, and evaluating pertinent laboratory studies. They will also participate with medical students in Departmental conferences, seminars, and rounds. The main difference between the Pediatric Associate clerkship and the medical-student clerkship is that the Associate's training will concentrate largely on the elements of health care as limited to children, and will give particular attention to ambulatory pediatrics.

These emphases will also characterize the Associate's internship training, the final year of professional education. For this purpose, a broad array of teaching settings are available—including not only the outpatient departments and special clinics of the University's Medical Center and of the Denver Department of Health and Hospitals, but also sizable O.E.O. Neighborhood Health Centers and their satellite health stations.

In addition, during their internship, the students in the Associates course will train in the offices of pediatricians in private practice, who will serve as their preceptors.

Another chief feature of the associate's professional education will be attention throughout the course of child development and growth, and family and community life as they affect behavioral patterns in health and illness.



DO YOU NEED

If you are a doctor or dentist or supervise a staff in a hospital or nursing home, there are times when you have wished that help was a phone call away. Now it is. Call us night or day for the nursing or medical office employees you need. Our service is national, our employees are experienced, screened, insured and bonded.

Childhood Sarcoidosis

In a series of 18 cases of sarcoidosis in children, outcome of the disease was more favorable in those who were asymptomatic at the time of diagnosis than in those who had symptoms. Sarcoidosis may be more prevalent in children than has been estimated.

Sarcoidosis is rarely diagnosed in children in an early stage. One reason is that children are not usually included in chest X-ray surveys which may lead to the discovery in adults of the clinically silent, early intrathoracic sarcoidosis. By the time sarcoidosis is recognized in children it may be advanced, with one or more extrathoracic components.

In a study of 18 cases of proved sarcoidosis in children, the outcome of the disease was found to correlate largely with the presence or absence of symptoms at diagnosis.

In age the children ranged from 9 to 15 years. Eleven were boys, seven were girls. The disease was symptomatic at the time of diagnosis in 11; asymptomatic in seven. All children 12 years of age and under, but only six of those 13 to 15 years of age, had symptoms at the time of diagnosis.

Seven of 11 children with symptoms already had chronic disease, and the disease in five of the seven asymptomatic children was in the subacute stage. Extrathoracic involvement had occurred in all the children with disease in the chronic stage, but only three of the asymptomatic children had such involvement.

Two of the children had normal X-ray films initially; the others had hilar adenopathy either alone (3) or with pulmonary mottling or mottling alone (13). Five of the children with hilar adenopathy and pulmonary mottling showed flocculent infiltrations; five had miliary nodules, and three had focal streaking. In one child who had parenchymal densities without hilar adenopathy, the lung pattern was diffusely reticular.

Eight of the *symptomatic* children had hilar adenopathy with pulmonary mottling. Two children with extrapulmonary sarcoidosis had a normal chest film. Three children with no symptoms at onset showed hilar adenopathy alone, and four others showed hilar adenopathy and pulmonary mottling.

Presenting Signs

Enlargement of the peripheral lymph nodes was the presenting sign in four of the 11 children with symptomatic onset. In three others, dimness of vision in one eye was the first sign. Signs in the other children were respiratory symptoms, weight loss, erythema nodosum, and parotid enlargement.

The Kveim test was positive in 16 of the 18 chil-

Louis E. Siltzbach, MD, and Gerald M. Greenberg, MD. *The New England Journal of Medicine,* December 5, 1968.

dren. Both children in whom it was negative had had sarcoidosis for more than three years when the Kveim test was applied. Diagnosis was confirmed by biopsy. Eleven children in all had organ biopsies.

All but two children had negative tuberculin tests, which is common in sarcoidosis. The two positive reactors responded only to second-strength PPD.

Ten children received drug therapy consisting of daily doses of either prednisone (or an equivalent hormone) or chloroquine; two of the 10 received both drugs at different times.

Observation Period

Seventeen of the children were observed for periods ranging from one to nine years (a mean of three and one-tenth years). At the end of the observation period, activity had subsided and all lesions had cleared in five, four of whom had been asymptomatic at onset. Ten other children improved, but clearing was not complete. Only two children, both with symptomatic onset, became worse.

Improvement, but not clearing of lesions, was observed in 14 of the 17 children during the *first* year, and was maintained in all but one of these. The remaining patient in this group developed bilateral nerve deafness in the second year. One child who became worse in the first year later lost the sight of one eye.

The course and outcome were distinctly less favorable for children with symptomatic onset than those who were asymptomatic and whose disease was detected by mass surveys or routine roentgenography. Six of seven asymptomatic children, all 13 years or older at the time of diagnosis, were clinically well when last observed.

However, of the 11 symptomatic children, only two were entirely well, and nine had varying grades of disease activity. Temporary improvement did occur spontaneously or with therapy in all the 11 children. Corticosteroid therapy helped control recent lesions. Chloroquine was of particular value in treating cutaneous sarcoidosis. Respiratory failure has not as yet been observed in any of the children.

The discovery that asymptomatic sarcoidosis was relatively common among young adults dates back to the mass X-ray surveys of Armed Forces recruits in World War II. There has since been growing recognition that a presymptomatic stage, marked only by silent, bilateral hilar adenopathy and frequently associated with a negative tuberculin test, is more common in the general population than had been recognized. Since children have not been included in mass radiographic surveys, the prevalence of childhood and adolescent sarcoidosis has not until recently been estimated in any country. In Japan and Hungary, children are being included in such surveys and asymptomatic cases are being uncovered at a prevalence rate approaching that of adults in those two countries.

Predicting Prognosis

In the series reported, the children with symptomatic onset were younger and had more extensive disease than those whose illness was detected in the asymptomatic stage. Because of the delayed detection of sarcoidosis in children whose symptoms were already present, corticosteroid therapy was required more frequently and for a longer time than it was for the asymptomatic group. The prognosis was also less favorable for the symptomatic child. Prognosis could be predicted with a fair degree of accuracy by the end of the first year of observation.

Thus, it appears that sarcoidosis may come and go unrecognized in children, especially in those approaching adolescence, and that the disease is more frequent in children than had been estimated.

A possible diagnosis of sarcoidosis should be considered in children with unexplained mediastinal or superficial lymphadenopathy, hepatosplenomegaly, uveitis, enlargement of the salivary or lacrimal glands, cystic bone lesions of the hands or feet, lung infiltrations or granulomatous skin lesions. Organ biopsy, Kveim test and appropriate radiography can lead to early diagnosis, after which proper therapy can be instituted, with the prevention of some of the irreversible organ damage.

No injection after all!

This penicillin produces high, fast levels—orally.

Pen•Vee® K is usually so rapidly and completely absorbed that therapeutic penicillin levels are attained within 15 to 30 minutes. Thus it can often obviate the need for penicillin injections. The higher serum levels produced generally last longer than with those of oral penicillin G.

Indications: Infections susceptible to oral penicillin G: prophylaxis and treatment of streptococcal infections; treatment of pneumococcal, gonococcal, and susceptible staphylococcal infections; prophylaxis of rheumatic fever in patients with a previous history of the disease.
Contraindications: Infections caused by nonsusceptible organisms; history of penicillin sensitivity.
Warnings: Acute anaphylaxis (may prove fatal unless promptly controlled) is rare but more frequent in patients with previous penicillin sensitivity, bronchial asthma or other allergies. Resuscitative (epinephrine, aminophylline, pressor amines) and supportive (antihistamines, methylprednisolone sodium succinate) drugs should be readily available. Other rare hypersensitivity reactions include nephropathy, hemolytic anemia, leucopenia and thrombocytopenia. In suspected hypersensitivity, evaluation of renal and hematopoietic systems is recommended.
Precautions: In suspected staphylococcal infections, perform proper laboratory studies including sensitivity tests. If overgrowth of nonsusceptible organisms occurs (constant observation is essential), discontinue penicillin and take appropriate measures. Whenever allergic reactions occur, withdraw penicillin unless condition being treated is considered life threatening and amenable only to penicillin. Penicillin may delay or prevent appearance of primary syphilitic lesions. Gonorrhea patients suspected of concurrent syphilis should be tested serologically for at least 3 months. When lesions of primary syphilis are suspected, dark-field examination should precede use of penicillin. Treat beta-hemolytic streptococcal infections with full therapeutic dosage for at least 10 days to prevent rheumatic fever or glomerulonephritis. In staphylococcal infections, perform surgery as indicated.
Adverse Reactions: (Penicillin has significant index of sensitization): Skin rashes, ranging from maculopapular eruptions to exfoliative dermatitis; urticaria; serum sickness-like reactions, including chills, fever, edema, arthralgia and prostration. Severe and often fatal anaphylaxis has been reported (see "Warnings").
Composition: Tablets—125 mg. (200,000 units), 250 mg. (400,000 units), 500 mg. (800,000 units); Liquid—125 mg. (200,000 units) and 250 mg. (400,000 units) per 5 cc.

Wyeth Laboratories Philadelphia, Pa.

ORAL **PEN•VEE® K**

(potassium phenoxymethyl penicillin) Wyeth®

What makes a

A man?
Another woman?
Three kids?
No kids at all?
Wrinkles?
You name it.

Is she truly depressed?

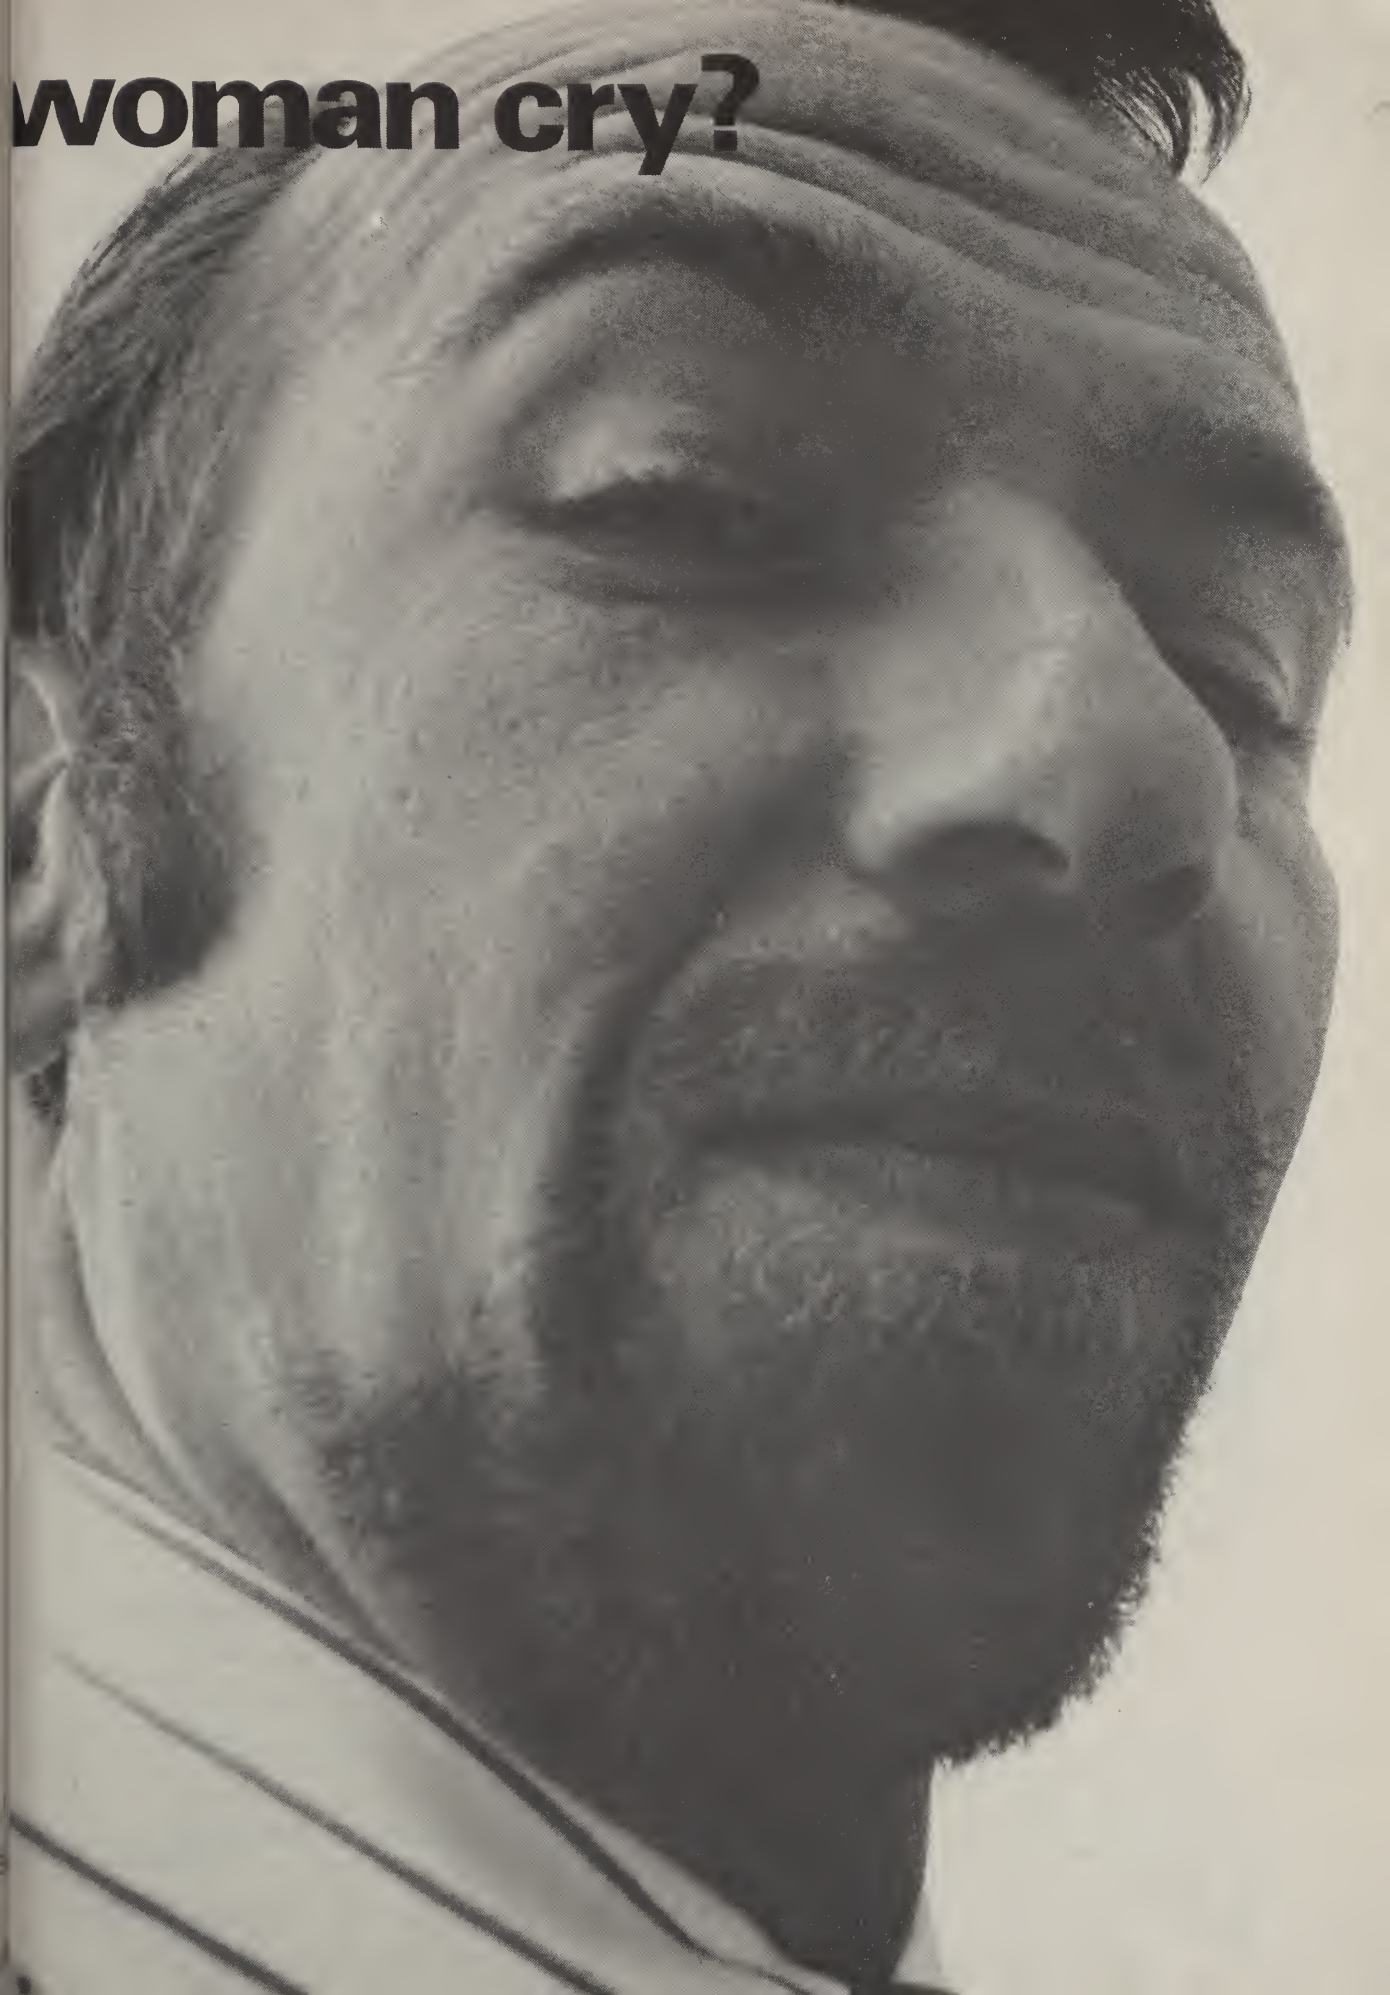
Is that why she lets go in your office?

You comfort her.
Talk to her.
And, if she is depressed, consider Pertofrane.
Because in 3 to 5 days she can often begin to cope, work, maybe play, even enjoy.

Pertofrane®

desipramine hydrochlorid
In depression...
when words are not enoug

But before you prescribe Pertofrane, please see the full prescribing information and especially note Contraindications, Precautions, Warning, Adverse Reactions and Dosage. A brief summary of that information is included here.



Pertofrane® desipramine hydrochloride

Indications: For relief of depression.
Contraindications: Do not use drugs of the M.A.O.I. class with Pertofrane. Hyperpyretic crises or severe convulsive seizures may occur; potentiation of adverse effects can be serious or even fatal. When substituting this drug in patients receiving an M.A.O.I., allow an interval of at least 7 days. Initial dosage in such patients should be low and increases should be gradual and cautiously prescribed.
Warning: Activation of psychosis may occasionally be observed in schizophrenic patients. Do not use in patients under 12 years old, and do not use in women who are or may become pregnant unless the clinical situation warrants the potential risk.
Precautions: Careful supervision and protective measures for potentially suicidal patients are necessary. Discontinuation of therapy or adjunctive use of a sedative or tranquilizer may be necessary in the presence of increased anxiety or agitation, hypomania or manic excitement. However, phenothiazines may aggravate the condition. Atropine-like effects may be more pronounced (e.g. paralytic ileus) in susceptible patients and in those receiving anticholinergic drugs (including antiparkinsonism agents). Carefully observe patients with increased intraocular pressure. Prescribe cautiously in hyperthyroid patients and in those receiving thyroid medications. Cardiovascular complications (myocardial infarction and arrhythmias) are potential risks since they have occasionally occurred with imipramine, the parent compound. Desipramine may block the pharmacologic activity of guanethidine and related adrenergic neuron-blocking agents. Hypertensive episodes have been observed during surgery in patients on desipramine therapy.
Before prescribing the drug, the physician should be thoroughly familiar with prescribing information, with the literature, with all adverse reactions, with the diagnosis and management of depression, and with the relative merits of all measures for treating the condition.
Adverse Reactions: Dry mouth, constipation, disturbed visual accommodation, anorexia, perspiration, insomnia, drowsiness, dizziness, headache, nausea, epigastric distress, and skin rash (including photosensitization) may appear. Since orthostatic hypotension has occurred, carefully observe patients requiring concomitant vasodilating therapy, particularly during the initial phases. Other adverse reactions include tachycardia, changes in EEG patterns, tremor, falling, mild extrapyramidal activity, neuromuscular incoordination, epileptiform seizures. A confusional state (with such symptoms as hallucinations and disorientation) occurs occasionally and may require reduced dosage or discontinuance of therapy. Rarely, transient eosinophilia, slight elevation in transaminase levels, transient jaundice, or liver damage have occurred. If abnormalities occur in liver function tests, discontinue drug and investigate. Occasional hormonal effects, particularly decreased libido or impotence and instances of gynecomastia, galactorrhea and female breast enlargement have been observed. Urinary frequency or retention may occur. The drug should be discontinued if agranulocytosis, bone marrow depression, jaundice, thrombocytopenia, or purpura occur.
Dosage: 25 to 50 mg. t.i.d. The maximum daily dose is 200 mg. Continue maintenance dosage for at least 2 months after obtaining satisfactory response. Generally, elderly and adolescent patients should be given low doses.
Availability: Pink capsules of 25 mg. in bottles of 100 and 1000. (B) 46-530-E

DROWNPROOFING

Teach your child drownproofing.

Drownproofing, according to the Health Insurance Institute, consists of a series of arm and leg movements that help a person move up and down instead of forward.

Detailed instructions for teaching this technique to youngsters are now being provided on a new wallet-sized card published free of charge by the U.S. Public Health Service.

If performed correctly, reports the PHS, it will allow a child to survive in the water for hours, even if it is rough.

The PHS card, "Safety Tips In-Out-and-Around the Water" may be obtained free in quantities up to 100 by writing to the Injury Control Program, National Center for Urban and Industrial Health, 222 East Central Parkway, Cincinnati, Ohio 45202.

OXFORD WATERFRONT

4½ acre waterfront point, 800 foot shoreline, includes vacation cottage, outbuildings, dock. Adjacent to Oxford, heart of Talbot County cruising waters, this offers A-1 investment and all the relaxation that waterfront seclusion affords. Offered at $45,000.

The Fortunate One.

Her urinary tract infection reveals itself through pain and discomfort.

While the pain and discomfort of a G.U. infection are anything but pleasant, the patient may be luckier than she realizes. That burning sensation (and/or frequency, urgency, dysuria) is a usually reliable sign of a urinary tract infection. And it's her good fortune that her infection won't go undetected...or untreated.

Azo Gantanol® therapy usually provides analgesic action within one-half hour, while control of the infection begins within two hours. Azo, a specific urinary analgesic, soothes inflamed mucosa to give symptomatic relief. At the same time, the antibacterial component, Gantanol (sulfamethoxazole), achieves therapeutic levels in the blood and urine, with diffusion into interstitial fluids. Azo Gantanol—a good choice when urinary tract infection reveals itself through symptomatic distress.

Before prescribing, please consult complete product information, a summary of which appears on opposite page.

Azo Gantanol®

(Each tablet contains 0.5 Gm sulfamethoxazole and 100 mg phenazopyridine HCl.)

Azo for the pain
Gantanol®
(sulfamethoxazole)
for the pathogens

Before prescribing, please consult complete product information, a summary of which follows:

Indications: Urinary tract infections with associated pain or discomfort when due to susceptible organisms; prophylactically in urologic surgery, catheterization and instrumentation.

Contraindicated in sulfonamide-sensitive patients, pregnant females at term, premature infants, newborn infants during the first three months of life, glomerular nephritis, severe hepatitis, uremia and pyelonephritis of pregnancy with gastrointestinal disturbances.

Warnings: Use only after critical appraisal in patients with liver damage, renal damage, urinary obstruction or blood dyscrasias. If toxic or hypersensitivity reactions or blood dyscrasias occur, discontinue therapy. In closely intermittent or prolonged therapy, blood counts and liver and kidney function tests should be performed.

Precautions: Observe usual sulfonamide therapy precautions including maintenance of an adequate fluid intake. Use with caution in patients with histories of allergies and/or asthma. Patients with impaired renal function should be followed closely since renal impairment may cause excessive drug accumulation. Occasional failures may occur due to resistant microorganisms. Not effective in virus and rickettsial infections.

Adverse Reactions: Headache, nausea, vomiting, urticaria, diarrhea, hepatitis, pancreatitis, blood dyscrasias, neuropathy, drug fever, skin rash, Stevens-Johnson syndrome, injection of the conjunctiva and sclera, petechiae, purpura, hematuria or crystalluria may occur, in which case the dosage should be decreased or the drug withdrawn.

Dosage: Adults—4 tablets initially, then 2 tablets morning and evening.

How Supplied: Tablets, bottles of 50.

GREENBERRY WOODS

NORTHERN PARKWAY AT JONES FALLS EXPRESSWAY

Wide Foundation

During his hospital training, many a resident has come to depend on the team approach to medical problems. Having no worries about the costs to the patients, the resident feels free to call for all the help he can get. When in a quandary, he has the services of innumerable consultants available.

During his training, this attitude can be for the good of the patient. As a tyro MD who may have enjoyed total scholarship aid for his education, he does not understand how much this type of medicine costs the taxpayers. Intellectual inadequacies are easily covered by the act of asking for consultation, no matter how often.

When these MDs enter private practice, there is a rude and abrupt awakening. Even after qualifying for certification in a specialty or subspecialty board, the MD can encounter problems not precisely in his field. Referring a patient with an acute otitis to an otorhinolaryngologist is one thing, but what to do with the patient with an abdominal pain is another. An urologist, gynecologist, surgeon, aller-

Baltimore

gist, or internist may be needed. For the newly independent MD, calling all of these physicians can at first seem easy and logical. However, when the patient asks him why so many physicians have sent him bills, the MD is forced to be concerned. Suddenly, he becomes aware of certain deficiencies in his training. Why didn't he learn which specialist to call?

Intensive knowledge in a subspecialty alone can be justified on occasion, but not at the expense of isolation from the rest of medical knowledge. Neither should the narrow limits of the super specialist cost the patient extra dollars and waste of time in finding the proper MD to care for him.

The medical educators who are seeking to rearrange the internship and residency programs should not neglect the need for a wide medical foundation upon which to build a specialty. There is no need for "quickie" specialists trained only in a narrow field. More, not less, time is needed for specialty training.

Who's Afraid of the Big Bad Wolf?

Afraid of the cold? The heat? The dark? Science has a word for you.

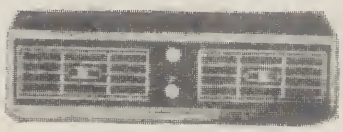
Do you fear dirt or nudity?

All the scientific words that describe your fears end in phobia. And most of us have at least one.

What's your phobia?

According to the Health Insurance Institute, many people have phobias without even realizing it—or being able to spell it.

Fear of the cold, for example, would be cheimophobia; fear of heat, thermophobia; of dirt, rypophobia; of darkness, achluophobia; of nudity, gymnotophobia.



Here is a list of phobias prepared by the Institute that most laymen have probably never heard before:

Agoraphobia—fear of open spaces.
Algophobia or **odynephobia**—of pain.
Arachnephobia—of spiders.
Dipsophobia—of drinking.
Electrophobia—of electricity.
Ereuthophobia—of blushing.
Gamophobia—of marriage.
Graphophobia—of writing.
Hematophobia—of blood.
Ideaphobia—of thought.
Ochlophobia—of crowds.
Oikophobia or **ecophobia**—of home.
Phobophobia—of developing phobias.
Taphophobia—of being buried alive.
Siderodromophobia—of railway trains.
Sitophobia—of eating.
Xenophobia—of strangers.
Zoophobia—of animals.

Blue Shield's Future Role in Title 19

As experience mounts under the Title 19 federal-state matching programs for the medically indigent, the advantages of offering such programs on an underwritten basis are becoming increasingly apparent.

Of the 38 state Title 19 programs now in operation, 16 are administered by Blue Shield and Blue Cross. In 14 other states, Blue Shield and Blue Cross have either submitted proposals or are in the process of drafting proposals for a fiscal agent's role.

As of December 31, 1968, Blue Shield Plans served more than 3 million persons under Title 19.

While carrier-administered programs have fared better than programs administered by a single state agency, an underwritten program would make maximum use of those private carriers which have demonstrated their proficiency in underwriting and servicing a broad health care program for a large segment of the population.

Title 19 programs, administered by a state agency, tend to isolate the recipient from the health care mainstream. Furthermore, in almost all instances, single state agencies administering these programs have demonstrated inability to properly and expeditiously handle medical claims administration, budget projections, provider relations, utilization review, and quality assurance programs.

Under the underwritten programs, group contracts for eligible recipients could be handled by a separate state agency outside the welfare department. In the case of a cash grant recipient, this agency would pay 100% of the cost of the individual policy. Other subsidy levels would be established according to defined income limits.

Thus, through an underwritten program the Title 19 recipient would become a full-fledged member of the health-care-consuming public, enjoying the same type of recognition and security that current Blue Shield members now have.

KNOW YOUR ZENITH DEALER . . .

Did You Know?

. . . that the dish we call "soup" had its beginnings in a tasty medieval snack called a "sop"? A "sop" consisted of bread chunks dipped in the broth of meat stews.

. . . that nearly 5 pounds of butter and about 15.2 quarts of ice cream were sold per person in the United States in 1967?

. . . that 34 percent of Americans go out for breakfast at least once a month; 63 percent enjoy a restaurant lunch at least monthly; and 59 percent have dinner in a restaurant once a month?

. . . that cow's milk is now available in tablet form? The tablets contain cow's milk that has been obtained through a process that removes the water and fat.

. . . that a study is currently underway to determine the effects of "the Pill" on body digestion and retention of nutrients, lactation and bone changes? The study is being conducted with rats.

. . . that Julius Caesar so loved Swiss cheese that he imported the delicacy for special banquets in ancient Rome?

. . . that houseflies are more susceptible to insect-killing sprays in the late afternoon than in the late morning?

. . . that the first food law of England was the Assize of Bread of 1203, dealing with false weights, and that offenders were driven through the streets with loaves of bread tied around their necks?

Information for Authors

MANUSCRIPTS: Manuscripts will be accepted for consideration for publication with the understanding that they are original, have never before been published, and are contributed solely to the Maryland State Medical Journal.

All manuscripts are acknowledged upon receipt and are followed up by notification of either acceptance or rejection. Rejected manuscripts are returned by regular mail. Accepted manuscripts become the property of the Journal and are not returned. The Journal is not responsible for loss of manuscripts through circumstances that are beyond its control.

Manuscripts should be addressed to: Editor, Maryland State Medical Journal, 1211 Cathedral St., Baltimore, Md. 21201.

SPECIFICATIONS: Manuscripts must be original typed copy, doublespaced throughout (Including text, case reports, legends, tables and references) with margins of at least 1½ inches. Pages should be numbered consecutively.

The manuscript should include the title (brief and concise), the full name of the author (or authors) with degrees, academic and professional titles, affiliations, and any institutional or other credits. Please include a complete address where the author may receive proofs of his article for his approval and corrections.

All manuscripts should be accompanied by a carbon or Xerox copy and the author should retain another copy for his records.

TABLES: Each table should be typed on a separate sheet of paper, be numbered, have a brief descriptive title, and its position in the text should be indicated.

Be sure that statistics are consistent in both tables and text.

REFERENCES: References should be limited to those citations noted in the text, and kept to a minimum of 18. (A complete review of the literature is rarely desirable.) The references must be typed, doublespaced, and are to be numbered consecutively as they appear in the text, with their positions in the text indicated. An alphabetized bibliography is used only when the listing is of books suggested for supplementary reading.

All references must be checked for absolute accuracy. Each journal reference must include author(s) and initials, complete title of article, name of publication, volume, first page of article, and date. Complete dates (month, day, and year) are to be included with all references that have appeared within the last three years. Include with book references name of author(s) and/or editor(s) with initials, title of book, edition, location, publisher, year, volume (if given), and page. If reference is to a chapter within a book, include the author of the chapter (if different from author of the book), and the title of the chapter, if any.

ILLUSTRATIONS: Authors are urged to use the services of professional illustrators and photographers when possible. Drawings and charts should always be done in black ink on white paper. Clear, glossy photographs, black on white, should be submitted and such illustrations numbered consecutively and their positions indicated in the text.

Magnifications will be modified in proportion to the amount of reduction necessary to fit the pages of the Journal. Please do not deface an illustration by writing on the front or the back, nor should it be taped or pasted to paper. The illustration may be pasted onto a piece of cardboard. Attached to the back of each illustration, chart or photograph should be the figure number. the author's name and the title of the article.

Legends for illustrations should be typewritten on a separate page with numbers corresponding to those on the photographs and drawings.

Recognizable photographs of patients are to be masked and should carry with them written permission for publication.

EDITORIAL RESPONSIBILITY: Manuscripts are subject to editorial modification and such revisions as are necessary to bring them into conformity with Journal style.

Statements made or opinions expressed by any contributor in any article or feature published in the Journal are the sole responsibility of the author.

PERMISSIONS: When material is reproduced from other sources, full credit must be given to both the author and publisher and written permission from these sources must be included when the material is submitted.

COPYRIGHT: Material that is published in the Maryland State Medical Journal is protected by copyright and may not be reproduced without the written permission of both the author and the Journal.

from the discord of anxiety...

to emotional harmony

with the aid of antianxiety

Librium®
(chlordiazepoxide HCl)

5-mg, 10-mg and 25-mg capsules

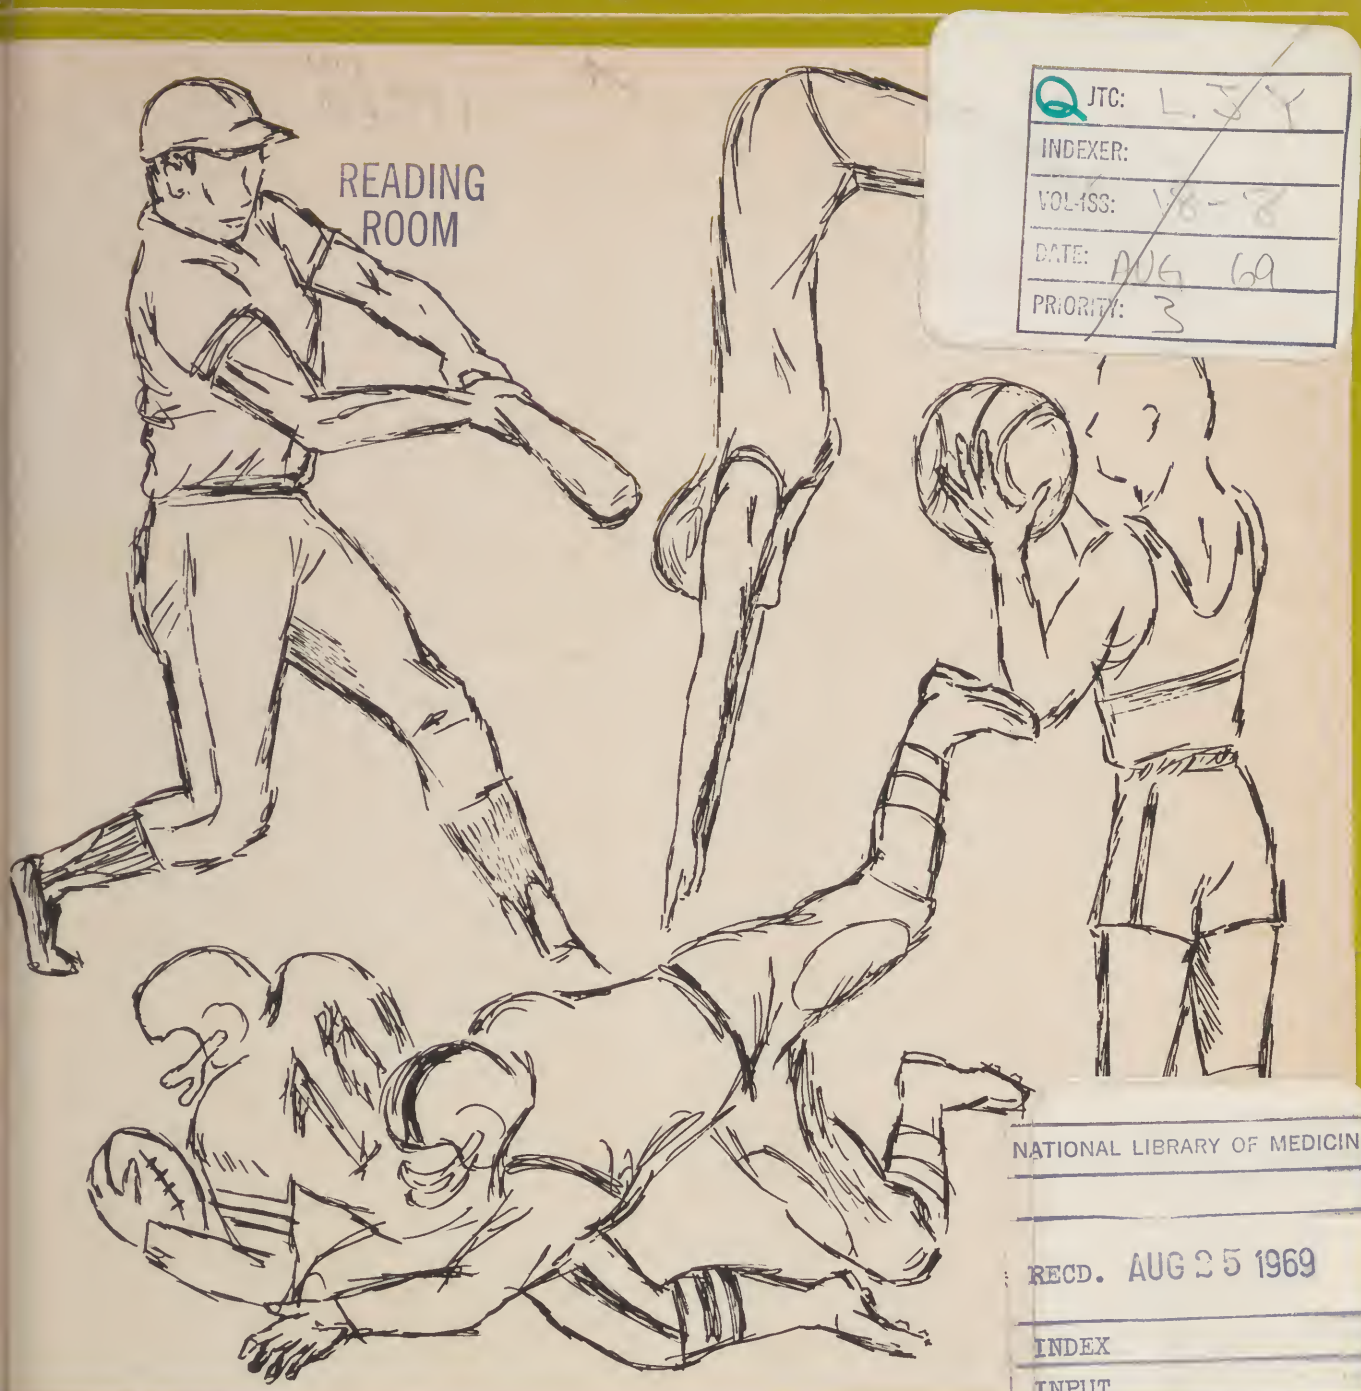
In an age of swift change and challenge, susceptible individuals may experience varying degrees of excessive anxiety. The resulting emotional stress may precipitate significant functional disorders or complicate existing organic disease. In properly individualized maintenance dosage, Librium (chlordiazepoxide HCl) quickly helps relieve anxiety and apprehension, provides useful adjunctive therapy in psychophysiologic disorders—yet seldom impairs mental acuity or ability to function. Librium has demonstrated a wide margin of safety in short- and long-term therapy.

Also available:

Libritabs®
(chlordiazepoxide)

ROCHE
Roche
LABORATORIES
Division of Hoffmann-La Roche Inc.
Nutley, New Jersey 07110

Before prescribing, please consult complete product information, a summary of which follows:



Indications: Indicated when anxiety, tension and apprehension are significant components of the clinical profile.

Contraindications: Patients with known hypersensitivity to the drug.

Warnings: Caution patients about possible combined effects with alcohol and other CNS depressants. As with all CNS-acting drugs, caution patients against hazardous occupations requiring complete mental alertness (e.g., operating machinery, driving). Though physical and psychological dependence have rarely been reported on recommended doses, use caution in administering to addiction-prone individuals or those who might increase dosage; withdrawal symptoms (including convulsions), following discontinuation of the drug and similar to those seen with barbiturates, have been reported. Use of any drug in pregnancy, lactation, or in women of childbearing age requires that its potential benefits be weighed against its possible hazards.

Precautions: In the elderly and debilitated, and in children over six, limit to smallest effective dosage (initially 10 mg or less per day) to preclude ataxia or oversedation, increasing gradually as needed and tolerated. Not recommended in children under six. Though generally not recommended, if combination therapy with other psychotropics seems indicated, carefully consider individual pharmacologic effects, particularly in use of potentiating drugs such as MAO inhibitors and phenothiazines. Observe usual precautions in presence of impaired renal or hepatic function. Paradoxical reactions (e.g., excitement, stimulation and acute rage) have been reported in psychiatric patients and hyperactive aggressive children. Employ usual precautions in treatment of anxiety states with evidence of impending depression; suicidal tendencies may be present and protective measures necessary. Variable effects on blood coagulation have been reported very rarely in patients receiving the drug and oral anticoagulants; causal relationship has not been established clinically.

Adverse Reactions: Drowsiness, ataxia and confusion may occur, especially in the elderly and debilitated. These are reversible in most instances by proper dosage adjustment, but are also occasionally observed at the lower dosage ranges. In a few instances syncope has been reported. Also encountered are isolated instances of skin eruptions, edema, minor menstrual irregularities, nausea and constipation, extrapyramidal symptoms, increased and decreased libido—all infrequent and generally controlled with dosage reduction; changes in EEG patterns (low-voltage fast activity) may appear during and after treatment; blood dyscrasias (including agranulocytosis), jaundice and hepatic dysfunction have been reported occasionally, making periodic blood counts and liver function tests advisable during protracted therapy.

(LTR23)

He is elderly.
He is on corticosteroids.
When he needs an antibiotic
he may be a candidate for

DECLOSTATIN® 300

Demethylchlortetracycline HCl 300 mg
and Nystatin 500,000 units
CAPSULE-SHAPED TABLETS Lederle

b.i.d.

To guard susceptible patients against intestinal monilial overgrowth during broad-spectrum therapy—the protection of nystatin is combined with demethylchlortetracycline in DECLOSTATIN.

For your susceptible candidates, prescribe DECLOSTATIN—the broad-spectrum therapy that prevents monilial overgrowth.

Effectiveness: Because its antibacterial component is DECLOMYCIN Demethylchlortetracycline, DECLOSTATIN should be equally or more effective therapeutically than other tetracyclines in infections caused by tetracycline-sensitive organisms. The antifungal component, Nystatin, protects against superinfection by antibiotic-resistant fungal overgrowth (particularly monilia) in the intestinal tract.

Contraindication: History of hypersensitivity to demethylchlortetracycline or nystatin.

Warning: In renal impairment, usual doses may lead to excessive accumulation and liver toxicity. Under such conditions, lower than usual doses are indicated, and, if therapy is prolonged, serum level determinations may be advisable. A photodynamic reaction to natural or artificial sunlight has been observed. Small amounts of drug and short exposure may produce an exaggerated sunburn reaction which may range from erythema to severe skin manifestations. In a smaller proportion, photoallergic reactions have been reported. Patients should avoid direct exposure to sunlight and discontinue drug at the first evidence of skin discomfort. Necessary subsequent courses of treatment with tetracyclines should be carefully observed.

Precautions: Overgrowth of nonsusceptible organisms may occur. Constant observation is essential. If new infections appear, appropriate measures should be taken. In infants, increased intracranial pressure with bulging fontanels has been observed. All signs and symptoms have disappeared rapidly upon cessation of treatment.

Side Effects: Gastrointestinal system—anorexia, nausea, vomiting, diarrhea, stomatitis, glossitis, enterocolitis, pruritus ani. Skin—maculopapular and erythematous rashes; a rare case of exfoliative dermatitis has been reported. Photosensitivity; onycholysis and discoloration of the nails (rare). Kidney—rise in BUN, apparently dose related. Transient increase in urinary output, sometimes accompanied by thirst (rare). Hypersensitivity reactions—urticaria, angioneurotic edema, anaphylaxis. Teeth—dental staining (yellow-brown) in children of mothers given this drug during the latter half of pregnancy, and in children given the drug during the neonatal period, infancy and early childhood. Enamel hypoplasia has been seen in a few children. If adverse reaction or idiosyncrasy occurs, discontinue medication and institute appropriate therapy. Demethylchlortetracycline may form a stable calcium complex in any bone-forming tissue with no serious harmful effects reported thus far in humans.

Average Adult Daily Dosage: 150 mg q.i.d. or 300 mg b.i.d. Should be given 1 hour before or 2 hours after meals, since absorption is impaired by the concomitant administration of high calcium content drugs, foods and some dairy products. Treatment of streptococcal infections should continue for 10 days, even though symptoms have subsided.

VOLUME 18 AUGUST 1969 NUMBER 8

CONTENTS:

Measurement of Physical Fitness, Edward N. Norris, EdD, RPT **70**

"Even a cursory survey of both professional and lay literature will evidence an overwhelming interest in 'physical fitness.' Indeed, the interest in and concern for fitness prompted the late President Eisenhower to create the Council on Youth Fitness now designated as the President's Council on Physical Fitness. Thus, in addition to the pleas of physical educators and physicians, even governmental agencies are urging both children and adults to achieve and maintain physical fitness."

Weight Control in Athletics, Herman C. Maganzini, MD, FACP **76**

"Weight control is a problem of substantial importance to all athletes and their coaches. In certain sports, such as wrestling, the attainment of a low weight can represent a disproportionate advantage. I hope to demonstrate that the proper weight loss or gain, to reach an optimum (rather than the minimum or maximum) is beneficial to the athlete in any sport including wrestling and football."

Skin Problems in Athletics, Harry M. Robinson, Jr., MD **81**

"It is interesting to note that the pamphlet published by the American Medical Association entitled, "Medical Evaluation of Candidates for School Sports" makes no mention of the cutaneous lesions that should disqualify a candidate for participation in athletic activities. It should be obvious that conditions such as, acne congoblata, furunculosis, impetigo contagiosa, monilial infections, plantar warts, swimming pool granulomas, mycotic infections, and contact dermatitis would disqualify a candidate for participation until the condition shows a satisfactory response to treatment. More adequate instruction should be given about the necessity for, and methods of, complete examination of the skin."

The Obese Child in Athletics, Milton S. Grossman, MD **83**

"Obesity can be determined in an individual by comparing weight to height. One of the most satisfactory charts for this purpose is the one based on Stuart's data. Stuart and his group in Boston were interested in anthropometry, the classification by body type—ectomorph, mesomorph, and endomorph—according to bone structure. This is an important concept to consider. There are numerous muscles in the body and mere weight does not reflect body mass, or the proportion of body mass that is fat."

SYMPOSIUM ON VIRAL DISEASES

Medical and Chirurgical Faculty Building

1211 Cathedral Street, Baltimore

A symposium co-sponsored by the Medical and Chirurgical Faculty, through its Committee on Postgraduate Education, Preventive Medicine, and Public Health, and the National Communicable Disease Center. Discussed will be such subjects as advances and horizons in virology, viral exanthems, hepatitis, respiratory viral diseases, laboratory diagnosis of viral diseases, antiviral agents, and rubella.

9:30 AM to 5:00 PM—Wednesday,

November 5, 1969

Registration fee, including lunch—$5.00

PLAN TO ATTEND

PLAN YOUR 1970 VACATION NOW

ORIENT TOUR

The Medical and Chirurgical Faculty is sponsoring a trip to the Orient, including 6 nights in Tokyo, 6 nights in Hong Kong and 2 nights in Honolulu. This all-inclusive trip is available at less than the regular round-trip air fare. Accommodations at deluxe hotels, full breakfast daily in the hotel, complete dinner nightly in a choice of restaurants, a modified sightseeing program, and all transportation are included. Leaves from Friendship Airport on May 1, 1970.

See the representative at the Hotel Hershey, September 4, 5, 6, during the Faculty's Semiannual Meeting, for full details and to make your reservation. A long to be remembered trip!

"Shall I order Maalox?"

"Yes. Patients respond well to it, and seem to take it more faithfully."

Works well · Doesn't constipate · Tastes good · Economical

Supplied: Maalox Suspension (12 fl. oz.). *Also available:* Maalox No. 1 Tablets (0.4 Gm.) : no sugar, low sodium content. Maalox No. 2 Tablets (0.8 Gm.) : double strength for double antacid action.

SELF-EMPLOYED PERSONS INCORPORATION CAUTION

A cautionary word is issued to all physicians who are contemplating incorporation under the Self-Employed Persons Act recently signed into law by the Governor.

Percentage arrangements of any sort are unethical and, under the regulations of the newly-in-force Commission on Medical Discipline, could be cause for revocation of license.

Physicians are reminded of this prohibition because attorneys who prepare such incorporation agreements are not always familiar with MEDICAL ETHICS, as opposed to the CANONS OF ETHICS of the Bar.

Copies of sample agreements for such incorporation may be obtained through the Faculty office.

NO SEMIANNUAL RESOLUTIONS

THERE ARE NO RESOLUTIONS FOR consideration at the Semiannual Meeting. Consequently, the date of the Reference Committee meeting has been cancelled.

NARCOTIC ADDICTION PROGRAM GUIDELINES

The Faculty's Mediation Committee has adopted strict regulations under which the various addiction programs in Maryland should operate.

Under these conditions, and only under these conditions can the Faculty consider such programs to be effective. A copy of the complete report and recommendations are being forwarded to the newly-created State Drug Abuse Authority for its consideration.

NEW PUBLICATION

In the hands of the printers is a new publication of the Faculty. Combining all previous individual publications into one, it will make a ready reference booklet for the busy physician and his aides.

It includes the various Codes of Cooperation subscribed to by the Faculty, as well as information on Laws, Rules and Regulations with which Physicians must Comply. In addition, it will also include appropriate reference materials in connection with other Faculty policies and positions.

NEW PUBLICATION (cont'd)

It will be available in the Fall and a copy will be mailed to all Faculty members.

DISPOSITION OF DRUG SAMPLES

Police throughout the State continue to bring to the attention of the Faculty that physicians (or their assistants) are indiscriminately disposing of drug samples in such a manner that they fall into the hands of unqualified persons.

Physicians are again reminded of their responsibility to dispose of unwanted drugs through proper channels, but in any event, through a mechanism whereby they do not fall into the hands of unauthorized personnel.

TRIP TO SPAIN

The Faculty-sponsored trip to Spain has now been scheduled for the period October 31-November 9. More details later.

Recommendations for the use of Rubella Vaccine as approved by the Subcommittee on Immunization Practices* of the Medical and Chirurgical Faculty of Maryland

Introduction

Rubella Virus Vaccine, live is recommended for routine immunization of children between the ages of one year and puberty (12 years). An interval of at least four weeks should be observed between the dose of rubella vaccine and any other live virus vaccination, i.e., smallpox, polio, measles.

Contraindications

Pregnant women should not receive rubella virus vaccine. Patients who have severe underlying disease such as leukemia, or generalized malignancy and patients who are being treated with steroids, alkylating drugs, antimetabolites or radiation should not be vaccinated. Patients with severe febrile illness should not be vaccinated until they recover. Care should be exercised in vaccinating persons with known hypersensitivity to the species from which the tissue culture cells were derived, that is, monkey kidney, duck embryo, rabbit kidney, etc. (indicated on the labeling). Persons sensitive to neomycin should be excluded.

It is highly probable that the vaccine will be in short supply during the period immediately following its release for public distribution. This will necessitate the adoption of certain priorities as to whom the vaccine should first be given.

Recommendations

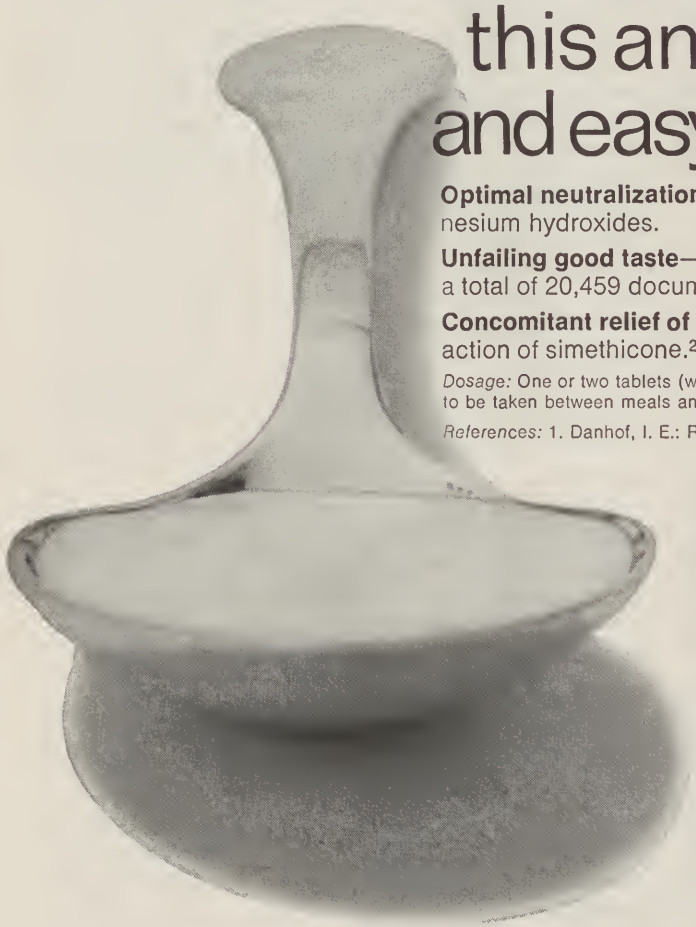
This Committee recommends that the vaccine be used as follows:

1. The vaccine acquired through a Federal Grant and administered by State and local health departments will be used primarily to immunize children of both sexes in the age group from kindergarten through the third grade including Head Start and Day Care children. It will be given in the schools.

2. Children from fourth grade through seventh (9-12 years) will not be included in the health department's program until the lower age group is covered, unless additional supplies of vaccine become available from Federal or local sources. Fifty percent of children by the time they are 7 are said to be immune to rubella from having had the disease. It is hoped that this group and especially the girls will be immunized and concentrated upon by private medicine. The waste of vaccine in vaccinating children already immune is avoidable only by making a pre-vaccination serology test for rubella antibodies. This is not recommended because it may be more expensive than giving vaccine to all girls in this age group.

3. When the supply of vaccine becomes more plentiful, rubella vaccination should be incorporated into the routine well-baby primary immunization schedule. In addition, immunization of remaining unprotected group of pre-school children can likewise be carried out.

4. For females who are above the age of 12 years and have passed puberty, the rubella vaccine should only be given with caution. It is possible that the greatest demand for rubella vaccination will come from girls and women in childbearing ages. Since the vaccine is absolutely contraindicated for women who are pregnant, every precaution must be taken to avoid the possible complications which might result from vaccinating a pregnant woman. The vaccination should be preceded by a blood test for rubella immunity. If the test shows a titer of 1-8 or greater, the woman is protected and there is no need for vaccination. If the test shows a titer of less than 1-8, the woman is susceptible to rubella. She may be vaccinated if it is certain that she is not pregnant and if she understands that it is imperative for her to avoid becoming pregnant for the following three months. Premarital examinations should include this procedure.



The Committee further recommends that although rubella vaccine is contraindicated for pregnant women every pregnant woman at her first prenatal examination should have a serologic test for rubella. Knowledge of immunity status may be valuable in the face of future exposure to the rubella virus (a case).

Warning: The medical profession is warned that the serologic test for rubella is a complex procedure which must be performed by well-trained competent technicians. In addition, a thorough knowledge of the immune response is essential for a proper interpretation of the test results. The HI test should not be attempted in a laboratory carrying out this test on an infrequent basis.

* Membership in the Subcommittee includes representatives of the State and Local Health Departments in addition to Medical and Chirurgical Faculty members.

the thousandth teaspoonful

Peptic ulcer patients find the thousandth dose of this antacid as effective and easy-to-take as the first!

Optimal neutralization—provided by the combination of aluminum and magnesium hydroxides.

Unfailing good taste—confirmed by 87.5% of 104 patients in one study, after a total of 20,459 documented days on Mylanta Liquid or tablets.[1]

Concomitant relief of G. I. gas distress—provided by the proven antiflatulent action of simethicone.[2]

Dosage: One or two tablets (well chewed or allowed to dissolve in the mouth); one or two teaspoonfuls to be taken between meals and at bedtime, or as directed by physician.

Treating vaginitis is as easy as AVC

Trichomonads...Monilia...Bacteria

You can depend on AVC—the comprehensive therapy that acts against all three major vaginal pathogens.

Monilia emerging as a major therapeutic problem—
recent studies report increased incidence, attributed in part to the use of oral contraceptives,[1-4] broad-spectrum antibiotics[5-9] and prolonged use of corticosteroids.[7]
recent evidence establishes high rate of microbiological and clinical cure with AVC.[9-11]

Comprehensive—Effective

The published record and more than two decades of clinical experience clearly establish the therapeutic value of AVC in vaginitis/cervicitis and vaginal surgery.

Easy as AVC

Contraindications: Known sensitivity to sulfonomides.
Precautions/Adverse Reactions: The usual precautions for topical and systemic sulfonomides should be observed because of the possibility of absorption. Burning, increased local discomfort, skin rash, urticaria or other manifestations of sulfonomide toxicity are reasons to discontinue treatment.
Dosage: One applicatorful or one suppository intravaginally once or twice daily.
Supplied: Cream—Four-ounce tube with or without applicator. Suppositories—Box of 12 with applicator.

new Orenzyme® Bitabs

One tablet q.i.d.

Trypsin: 100,000 N.F. Units, Chymotrypsin: 8,000 N.F. Units.; equivalent in tryptic activity to 40 mg. of N.F. trypsin

DOUBLE STRENGTH

Proteolytic enzyme therapy specifically indicated for the rapid resolution of inflammation and edema as adjunctive therapy in accidental and surgical trauma.

1 tablet q.i.d. provides recommended therapeutic dose at lower cost.

Description: ORENZYME BITABS offers the therapeutic effects of trypsin in an oral form as adjunctive therapy for the rapid resolution of inflammation and edema. ORENZYME BITABS is convenient to use, promotes patient cooperation and is ideally suited for maintenance therapy following parenteral trypsin.

Indications: When used as adjunctive therapy for the rapid resolution of inflammation and edema, good results have been obtained in:

- ☐ Accidental Trauma
- ☐ Postoperative Tissue Reactions.

Other conventional measures of treatment should be used as indicated. In infection, appropriate anti-infective therapy should be given.

Contraindications: ORENZYME BITABS should not be given to patients with a known sensitivity to trypsin or chymotrypsin.

Precautions: It should be used with caution in patients with abnormality of the blood clotting mechanism such as hemophilia, or with severe hepatic or renal disease. Safe use in pregnancy has not been established.

Adverse Reactions: Adverse reactions with ORENZYME have been reported infrequently. Reports include allergic manifestations (rash, urticaria, itching), gastrointestinal upset and increased speed of dissolution of animal-origin surgical sutures. There have been isolated reports of anaphylactic shock, albuminuria and hematuria. Increased tendency to bleed has also been reported but, in controlled studies, it has been seen with equal incidence in placebo-treated groups. (See Precautions.) It is recommended that if side effects occur medication be discontinued.

Dosage: One tablet q.i.d.

"I'm sick of spinning"

When vertigo began, her life took a turn for the worse.
Either she spins and the room stands still,
or the other way around... and around and around.
Even when she lies down, the spinning
continues. Sometimes there's nausea and vomiting, too.
It's just one thing after another.

You can help stop the spin with

BONINE®

(MECLIZINE HCl)

Bonine protects most patients against vertigo and nausea up to 24 hours with a single dose. Pleasant-tasting Bonine tablets are chewable and can be taken anytime, anywhere, without water. In difficult cases, multiple daily doses may be necessary for maximum response.

Precautions: Although the incidence of drowsiness and atropine-like side effects such as dry mouth and blurring of vision is low, the physician should alert the patient to the need for due precautions when engaging in activities where alertness is mandatory. *Use in women of childbearing age:* In weighing potential benefits vs. risk in women of childbearing age, consider the fact that a review of available animal data reveals that meclizine exerts a teratogenic response in the rat. In one study a dose of 50 mg./kg./day (50 times the maximum recommended human dose) produced cleft palate in 2 of 87 fetuses when administered to the rat at critical times during the first 15 days of gestation. At doses of 125 mg./kg./day, meclizine will produce 100% incidence of cleft palate in the rat. At doses of 25 mg./kg./day, decreased calcification of the vertebrae and relative shortening of the limbs were also produced in the rat, but experts disagree as to whether this is a teratogenic response. While available clinical data are inconclusive, scientific experts are of the opinion that this drug may possess a potential for adverse effects on the human fetus. Consequently, consideration should be given to initial use of a nonphenothiazine agent that is not suspected of having a teratogenic potential. In any case, the dosage and duration of treatment should be kept to a minimum.
Supply: 25 mg. scored tablets.
More detailed professional information available on request.

Heart Transplants

and the Life Insurance Medical Research Fund

The Life Insurance Medical Research Fund is playing a significant role in research on heart transplantation, according to the Fund's Annual Report, issued recently, which outlines some of the 64 grants and fellowships totaling more than $1.5 million for the 1968-69 year.

The LIMRF, supported by more than 130 life insurance companies in the United States and Canada, presents the awards annually to aid medical research in the biological and life sciences. Since the establishment of the Fund in 1945, approximately 900 institutions and medical scientists have received more than $23 million.

Featured in this year's report is the research done by previous recipients in two of medicine's most discussed areas: heart transplantation and synthetic life. The report points out that many continuing research projects in these two areas have been undertaken in heart surgery, oxygen exchange, infections, red blood cells, genetic code, and structure of enzymes and proteins.

The report also discusses the accomplishments of eight medical scientists who completed their fellowships this past year, as well as eight of the 30 institutions awarded grants this year.

To obtain a copy of the report, write to: Institute of Life Insurance, 277 Park Ave., New York, N. Y. 10017.

THE MONTH IN WASHINGTON

The Internal Revenue Service plans to audit the federal income tax returns of physicians and other health practitioners who have received more than $25,000 a year in medicare and medicaid payments.

Plans for the special audit were disclosed by IRS Commissioner Randolph W. Thrower at the first of a series of public hearings the Senate Finance Committee is holding in its investigation of the rising costs of the two government health care programs. He said the Department of Health, Education and Welfare had agreed to require intermediary insurance carriers to use physicians' social security numbers on reports of payments under the program in the future.

Finance Committee Chairman Russell B. Long (D., La.) estimated "possibly as many as 10,000" had been getting upwards of $25,000 a year under the programs. Thrower said the initial audits would be for 1967 and would be limited to those receiving more than $50,000.

Long said that the investigation of the committee's staff so far showed "widespread abuse, and fraud, as well as lax administration."

Robert M. Ball, social security administrator, reported his investigators had looked into more than 700 possible fraud cases under medicare. He said more than 300 of these cases were still in some stage of inquiry, and that 14 had been turned over to the Justice Department for prosecution.

"But these should not be taken as a reflection on the 200,000 doctors participating in medicare," Ball said. He added that a bigger problem than outright fraud were "cases that don't quite become fraud."

HEW Undersecretary John G. Veneman told the committee that the Nixon Administration wants congressional authority to stop medicare payments to doctors who overcharge, use inferior supplies, or engage in fraud.

"Under present medicare law, there is no authority for the program to deny reimbursement to a licensed practitioner, who has demonstrated a clear pattern of fraud, repeated overcharging of the program or the use of supplies which are inferior or harmful," Veneman said.

"We are recommending authority . . . to discontinue future reimbursement and to put all parties on notice to this effect where on the basis of clear evidence, a finding is made that this is justified by reason of such abuses."

Commenting on the hearings, **Dwight L. Wilbur, MD,** President of the American Medical Association, said that the vast majority of physicians serving medicaid patients are not overcharging for their services.

"Most physicians," Dr. Wilbur said, "are acting honorably and with utmost restraint. Fortunately, very few MD's participating in medicaid are guilty of overcharging and otherwise exploiting the program. Such exploitation by a minuscule minority was unavoidable. . . .

". . . The medical profession is making a great effort to identify and weed out dishonest doctors who betray their oath as professional men serving the public. We have been successful in this search, but a few physicians remain who still are not identified. We shall search them out and expose them, for the good of the entire profession."

Meantime, HEW issued a regulation limiting the fees paid by states to physicians, dentists, and other health practitioners under medicaid.

Under the regulation, a state's medicaid payment to a physician for a service shall be limited, with one exception, to the 75th percentile of the customary charge—the maximum customary fee of 75% of the physicians in the area.

If a state has been paying more than the 75th percentile of the customary charge, it must not exceed the medicare level, about the 83rd percentile. A medicaid official said that only two states may have to roll back their fees, but declined to name them.

After July 1, 1970, states may request permission to increase physicians' fees above the 75th percentile if two conditions are met:

1. The average percentage increase requested above the 75th percentile on January 1, 1969, may not exceed the percentage increase in the all-services component of the Consumer Price Index (adjusted to exclude the medical component) or in an alternate index designated by the Secretary of Health, Education, and Welfare.

2. Evidence must be clear that the providers and the states have cooperatively established effective utilization review and quality control systems.

The new fee regulation also requires states to revise their

medicaid plans to include descriptions and details of their payment structures. A state that wishes to revise its payment structure for practitioner's services or change the payments authorized under it may not do so until the proposed changes have been approved by the Secretary of Health, Education, and Welfare or his representative.

States that begin their medicaid programs after July 1, 1969, must arrange their payment structures so that fees do not exceed the 75th percentile of customary charges.

HEW estimated the regulation would result in a saving of $65 million in the first year.

Despite a strong protest by the American Hospital Association, HEW discontinued the overhead medicare-medicaid percentage allowance paid to hospitals, extended care facilities and other institutional providers. It was 2% for non-profit and 1½% for proprietary institutions. The action became effective July 1, 1969.

Another new medicaid regulation requires states to provide periodic health screening, diagnosis, and treatment for all eligible youths under 21 years of age, effective July 1, 1969.

HEW also established a new classification of institution—called intermediate care facility—eligible to receive federal contributions for the care of aged, blind, or disabled recipients; public assistance is covered in another regulation. This should reduce costs of medicaid by allowing states to relocate substantial numbers of welfare recipients who are now in skilled nursing homes in lower costs institutions, HEW said.

*** *** ***

Roger O. Egeberg, MD, who has been dean of the School of Medicine, University of Southern California since 1964, was selected to be the new Assistant Secretary of Health, Education, and Welfare for Health and Scientific Affairs after a five-month delay.

President Nixon nominated Dr. Egeberg after HEW secretary Robert H. Finch "reluctantly and regretfully" withdrew his unannounced, but widely-publicized, selection of John H. Knowles, MD, director of Massachusetts General Hospital, Boston. Finch said that "the protracted and distorted discussion" about the appointment during the five months the post had been vacant "resulted in a situation in which he (Knowles) would not be able to function effectively in this critical position."

The news media—press, radio and television—generally assigned the opposition to Dr. Knowles to conservative members of Congress, led by Senate Republican Leader Everett M.

Apply internally.

Take a relaxing break for Coca-Cola. Couple of times a day. Because Coke has the taste you never get tired of. It's always refreshing.

Dirksen, and to the AMA.

Throughout the public controversy before the appointment, the AMA confined its comment to a short statement that it had suggested several names to Finch for the post and that the Association "favored the appointment of someone who would represent the broadest scope of medicine and would not be too closely oriented to any one segment of medicine or the health field." Knowles was not one of the physicians on the AMA list.

A few days after the nomination of Dr. Egeberg, Dr. Dwight L. Wilbur said:

"During the last five months the American Medical Association has been identified repeatedly as a force opposing appointment of Dr. John H. Knowles as Assistant HEW Secretary for Health and Scientific Affairs.

"We held our silence during the last months of nation-wide publicity because we agreed with Secretary Finch to make our suggestions to him and then say no more. We did that. The Knowles protagonists obviously did just the opposite . . . .

"In a true sense, we never opposed Dr. Knowles. But we did not support him because we had alternative recommendations."

Those recommended by AMA for the position, Dr. Wilbur said, included:

Dr. W. Clarke Wescoe, former Chancellor of the University of Kansas, "who withdrew soon after because of personal reasons." **Dr. Richard S. Wilbur,** Palo Alto Clinic, Chairman of the Council of the California Medical Association, and former Chairman of the Board of California Blue Shield, "who happens to be my nephew, a fact which complicated the situation, but who AMA felt was a well-qualified man for this position. **Dr. John R. Hogness,** Dean of the University of Washington School of Medicine, "who serves in the AMA House of Delegates, at a high level in the Association of American Medical Colleges, and who has many other distinguished achievements."

The AMA commended the selection of Dr. Egeberg. In a telegram to Finch, Dr. Wilbur said:

"We look forward to a productive relationship with you and Dr. Egeberg in advancing the health care system for the benefit of all the American people. There are many complex factors involved that will call for the wholehearted dedication and contribution of all in the medical profession and in government. . . ."

"We believe Dr. Egeberg will be able to bring about the necessary close coordination between government and private sectors in the health care system. This is vital to constantly advance and expand the ability

HIGHLAND HOSPITAL

Asheville, North Carolina

Founded 1904

A DIVISION OF THE DEPARTMENT OF PSYCHIATRY OF DUKE UNIVERSITY

Accredited by the Joint Commission on Accreditation and Certified for Medicare

Complete facilities for evaluation and intensive treatment of psychiatric patients, including individual psychotherapy, group therapy, psychodrama, electro-convulsive therapy, Indoklon convulsive therapy, drugs, social services work with families, family therapy, and an extensive and well organized activities program, including occupational therapy, art therapy, athletic activities and games, recreational aotivities and outings. The treatment program of each patient is carefully supervised in order that the therapeutic needs of each patient may be realized.
High school facilities for a limited number of appropriate patients are now available on grounds. The School Program is fully integrated into the hospital treatment program and is accredited through the Asheville School System.
Complete modern facilities with 85 acres of landscaped and wooded grounds in the city of Asheville.

Area Code 704—254-3201

to provide quality health care for all Americans."

Dr. Egeberg, 65, is a large, bluff man of Norwegian stock who revealed a sense of humor at his first news conference. He is a member of the AMA and a Diplomate of the American Board of Internal Medicine. Generally considered a moderate liberal on health matters, he served on several advisory commissions during the Kennedy and Johnson Administration, and on the state level in California. One of his major interests has been health care of the poor and he arranged for the USC medical school to be the medical consultant for the neighborhood health center in the Watts district of Los Angeles.

At his first news conference in HEW, he classified delivery of health care as almost the department's number one problem. He said medicare now is "rather well established" in solving a problem. But medicaid, he said, "has run afoul of a number of things, and I don't know that one can blame any one person or any group for this."

A member of the army medical corps in World War II, he was personal physician and aide-de-camp to General of the Army Douglas MacArthur, 1944-45.

Average Prescription Drug Costs $3.43

Clues to PVD

The heavy smoker with vasospasm

He may be comparatively young or approaching middle age. Typically, he is a heavy cigarette smoker—a pack or more a day for a number of years. Whether smoking is a causative or an important exacerbating factor in peripheral vascular disease is still under discussion. But the vasoconstrictive effects of nicotine are firmly supported by a substantial body of laboratory and clinical evidence, and the close association is now generally accepted.

Thus, a history of heavy smoking coupled with vasospasm may serve as warning signals to the physician. When a diagnosis is established, therapeutic measures are directed toward increasing the local circulation, and appropriate management of the patient's general medical needs should be instituted. These include the important safeguards of keeping warm and refraining from smoking.

Before prescribing Roniacol Timespan (nicotinyl alcohol tartrate), please consult complete product information, a summary of which follows.

Indications: Conditions associated with deficient circulation; *e.g.*, peripheral vascular disease, vascular spasm, varicose ulcers, decubital ulcers, chilblains, Meniere's syndrome and vertigo.

Caution: Roche Laboratories endorses caution in the administration of any therapeutic agent to pregnant patients.

Side Effects: Transient flushing, gastric disturbances, minor skin rashes and allergies may occur in some patients, seldom requiring discontinuation of the drug.

Dosage: 1 or 2 Timespan Tablets morning and night.

How Supplied: Timespan Tablets—150 mg nicotinyl alcohol in the form of the tartrate salt —bottles of 50.

ROCHE
Roche
LABORATORIES
Division of Hoffmann-La Roche Inc.
Nutley, New Jersey 07110

Important in total management of peripheral vascular disease, vascular spasm or chilblains

Roniacol® Timespan®

(nicotinyl alcohol tartrate)

for relief of ischemic symptoms

Convenience of b.i.d. dosage—sustained-release Timespan Tablets usually provide prolonged relief of ischemic symptoms with two doses daily.

Smoothness of onset—the action of Roniacol (nicotinyl alcohol) is smooth and gradual in onset, rarely causing severe flushing.

Selectivity of action—relaxes the musculature of peripheral blood vessels.

High degree of safety—side effects seldom require discontinuation of therapy.

Mild ulcerative colitis may be triggered here...

In mild ulcerative colitis, a number of factors can precipitate an attack: for instance, dietary indiscretion, such as eating raw foods, or emotional overreaction, such as that aroused by financial difficulties. No matter what causes the patient's sensitive colon to "act up," he soon suffers from acute discomfort... and often, from anxiety and apprehension as well. Such patients frequently respond well to adjunctive dual-action Librax® therapy.

Librax combines, in a single convenient capsule, the well-known antianxiety effect of Librium® (chlordiazepoxide HCl) and the dependable anticholinergic/antispasmodic effect of Quarzan® (clidinium Br). Therefore, as Librax helps to relieve the patient's excessive anxiety and reduce his overreaction to stress, it also, at the same time, helps to control hypersecretion and hypermotility, thus relieving spasm and abdominal discomfort.

With Librax, the dosage schedule is simple: 1 or 2 capsules, t.i.d. or q.i.d., will in most cases bring the patient significant relief of both the emotional and physical elements that contribute to his psychovisceral disorder.

Before prescribing, please consult complete product information, a summary of which follows.

INDICATIONS: Indicated as adjunctive therapy to control emotional and somatic factors in gastrointestinal disorders.

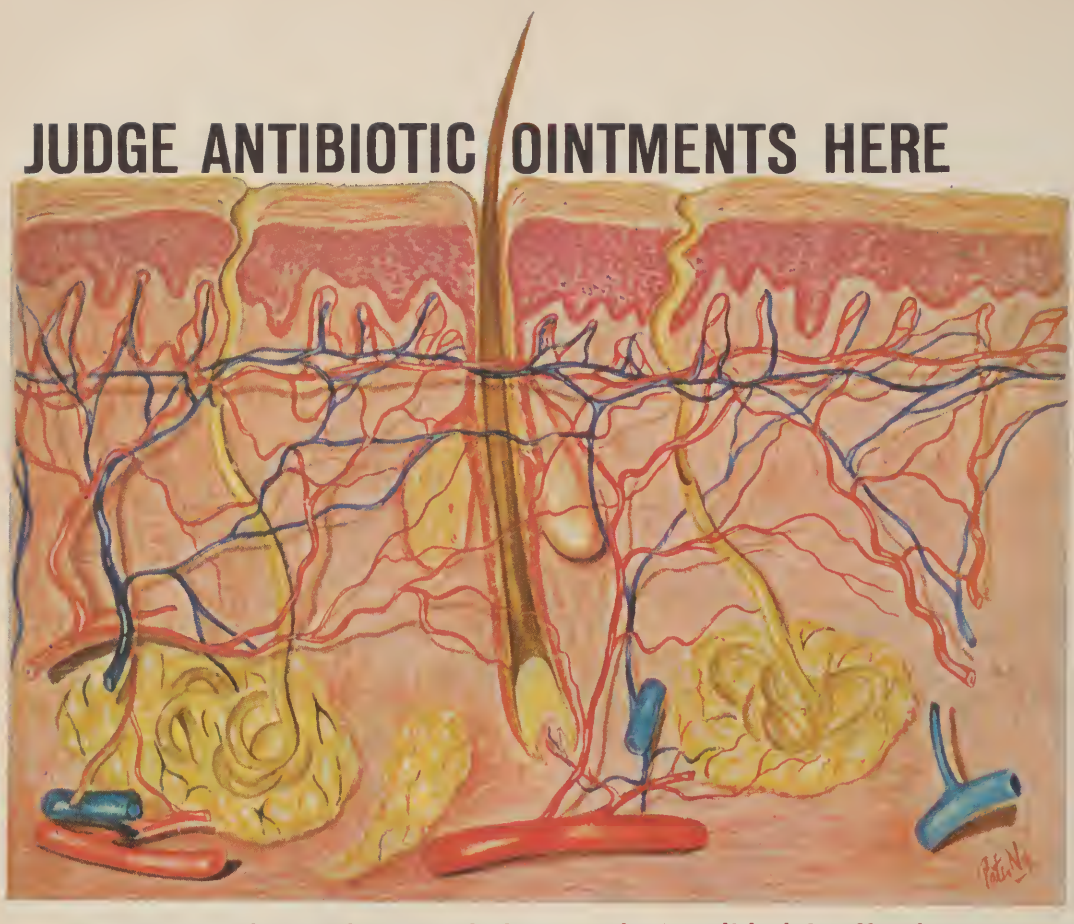
CONTRAINDICATIONS: Patients with glaucoma; prostatic hypertrophy and benign bladder neck obstruction; known hypersensitivity to chlordiazepoxide HCl and/or clidinium bromide.

WARNINGS: Caution patients about possible combined effects with alcohol and other CNS depressants. As with all CNS-acting drugs, caution patients against hazardous occupations requiring complete mental alertness (*e.g.*, operating machinery, driving). Though physical and psychological dependence have rarely been reported on recommended doses, use caution in administering Librium (chlordiazepoxide hydrochloride) to known addiction-prone individuals or those who might increase dosage; withdrawal symptoms (including convulsions), following discontinuation of the drug and similar to those seen with barbiturates, have been reported. Use of any drug in pregnancy, lactation, or in women of childbearing age requires that its potential benefits be weighed against its possible hazards. As with all anticholinergic drugs, an inhibiting effect on lactation may occur.

PRECAUTIONS: In elderly and debilitated, limit dosage to smallest effective amount to preclude development of ataxia, oversedation or confusion (not more than two capsules per day initially; increase gradually as needed and ter-

or here.

ited). Though generally not recommended, if combination therapy with other psychotropics seems indicated, carefully consider individual pharmacologic effects, particularly in use of potentiating drugs such as MAO inhibitors and phenothiazines. Observe usual precautions in presence of impaired renal or hepatic function. Paradoxical reactions (*e.g.*, excitement, stimulation and acute rage) have been reported in psychiatric patients. Employ usual precautions in treatment of anxiety states with evidence of impending depression; suicidal tendencies may be present and protective measures necessary. Variable effects on blood coagulation have been reported very rarely in patients receiving the drug and oral anticoagulants; causal relationship has not been established clinically.



ADVERSE REACTIONS: No side effects or manifestations not seen with either compound alone have been reported with Librax. When chlordiazepoxide hydrochloride is used alone, drowsiness, ataxia and confusion may occur, especially in the elderly and debilitated. These are reversible in most instances by proper dosage adjustment, but are also occasionally observed at the lower dosage ranges. In a few instances syncope has been reported. Also encountered are isolated instances of skin eruptions, edema, minor menstrual irregularities, nausea and constipation, extrapyramidal symptoms, increased and decreased libido—all infrequent and generally controlled with dosage reduction; changes in EEG patterns (low-voltage fast activity) may appear during and after treatment; blood dyscrasias (including agranulocytosis), jaundice and hepatic dysfunction have been reported occasionally with chlordiazepoxide hydrochloride, making periodic blood counts and liver-function tests advisable during protracted therapy. Adverse effects reported with Librax are typical of anticholinergic agents, *i.e.*, dryness of mouth, blurring of vision, urinary hesitancy and constipation. Constipation has occurred most often when Librax therapy is combined with other spasmolytics and/or low residue diet.

two good reasons for prescribing LIBRAX®

Each capsule contains 5 mg chlordiazepoxide HCl and 2.5 mg clidinium Br.

ROCHE
ROCHE LABORATORIES
Division of Hoffmann-La Roche Inc.
Nutley, New Jersey 07110

JUDGE ANTIBIOTIC OINTMENTS HERE

Results on skin are final proof of any topical antibiotic's effectiveness

No in vitro test can duplicate a clinical situation on living skin. 'Neosporin' (polymyxin B—bacitracin—neomycin) Ointment has consistently proven its effectiveness in thousands of cases of bacterial skin infection. The spectra of the three antibiotics overlap in such a way as to provide bactericidal action against most pathogenic bacteria likely to be found topically. Diffusion of the antibiotics from the special petrolatum base is rapid since they are insoluble in the petrolatum, but readily soluble in tissue fluids. The Ointment is bland and nonirritating.

Caution: As with other antibiotic preparations, prolonged use may result in overgrowth of nonsusceptible organisms and/or fungi. Appropriate measures should be taken if this occurs. Articles in the current medical literature indicate an increase in the prevalence of persons allergic to neomycin. The possibility of such a reaction should be borne in mind.

Contraindications: This product is contraindicated in those individuals who have shown hypersensitivity to any of its components.

Supplied: Tubes of 1 oz., ½ oz. with applicator tip, and ⅛ oz. with ophthalmic tip.

Complete literature available on request from Professional Services Dept. PML.

Expansion of Sheppard-Pratt Hospital Underway

Unlike many originators whose plans are initiated according to chance and challenge, Moses Sheppard had the foresight to know his work would grow after him. So he designed an institution of simplicity and practicality amid pleasant surroundings. The institution was to be a haven for the mentally disturbed—the troubled, the anxious, the hysterical, the manic, and the depressed. It would also house trained personnel who, with the aid of medical science, could help the individual return to his home and family, confident that he can cope with life. Everything was to be done for the comfort and recovery of the patient.

That was in 1858. Since then, many others have furthered his work, including Enoch Pratt who now shares the name of the institution—The Sheppard and Enoch Pratt Hospital. But his work has not ceased; it continues today. With the need for renovations, facilities for educational and consultative work, outpatient services, psychiatric training of doctors, nurses, and social workers, and the increase in educational work with disturbed children and adolescents, comes the need for expansion. This is what the cornerstone laying of the hospital's new central building was all about.

The ceremony took place on May 13, 1969, at which Governor Mandel was featured speaker. State officials, trustees, and other notables were also present. Hopefully, this building will help to meet these present needs.

Featured speaker at the cornerstone laying ceremony was Governor Marvin Mandel. On his right are Anthony J. Ianniello (hidden by the podium) architect for the New Central Building of the hospital; John Sargeant, Executive Secretary of the Medical and Chirurgical Faculty, and Robert W. Gibson, MD, Medical Director of the hospital.

MEDICAL NEWS

The Commonwealth Fund and the Carnegie Corporation of New York have jointly announced grants which will enable five of North America's leading medical schools to launch a collaborative program, including the education of a new type of clinical physician, aimed at improving systems and institutions for providing medical care and health services.

The collaborative program is being developed under the supervision of the Departments of Medicine of the five schools—including **Julius R. Krevans, MD, of Johns Hopkins**—and is underwritten by a $250,000 grant from the Carnegie Corporation and $298,100 from the Commonwealth Fund.

Dr. Krevans is a professor of medicine at The Johns Hopkins University School of Medicine, and has recently been named Dean of Academic Affairs of the medical school. He also serves as Physician-in-Chief at Baltimore City Hospitals.

The trustees of the Caleb Fiske Prize Essay of the Rhode Island Medical Society have announced as the subject for this year's dissertation, "Medical Education In The Years Ahead." A cash prize of $500 is offered. Essays must be submitted by December 15, 1969.

For further information, write to the Secretary, Caleb Fiske Fund, Rhode Island Medical Society, 106 Francis Street, Providence, Rhode Island 02903.

* * *

The Baltimore County Medical Association recently held an "open house" at its new office, 8523 Loch Raven Boulevard, in the Baynesville area of Baltimore County.

* * *

Dr. Solomon

Stressing urgent manpower needs and the multitude of Maryland's social problems, **Dr. Neil Solomon,** newly appointed Secretary of Health and Mental Hygiene, said that he will be asking members of the professional staffs of the departments under his control to participate as widely as possible in community activities.

Dr. Solomon said that he expects to make a personal contribution himself by continuing his already numerous appearances as a public service and by continuing, on a limited basis, a research project which he has been conducting on metabolic disorders. He explained that this research project is supported entirely by the contributions of patients who are participating in it.

* * *

Louis Padovano, MD, has been ordained a priest in the Society of Jesus (Jesuits). He began studies for ordination to the priesthood in 1964, after receiving his MD from Georgetown University School of Medicine in 1956. Dr. Padovano has also completed two tours of duty in Viet Nam.

* * *

Frederick L. Wehr has been re-elected president of The Children's Hospital, Greenspring Avenue, for his 11th term.

Re-elected Medical Director of the hospital was **George O. Eaton, MD;** and **Edmond McDonnell, MD,** was re-elected assistant medical director.

* * *

The following members of the American Society of Anesthesiologists have recently been made Fellows of the American College of Anesthesiologists: **Manuel Jesus Balseiro, MD,** of Silver Spring; **Harry Cohen, MD,** Baltimore; **Jack Egnatinsky, MD,** Annapolis, and **Richard Paul Strader, MD,** of Bethesda.

* * *

Recently appointed Chief of the Division of Communicable Diseases in the State Health Department is **Howard J. Garber, MD.** Dr. Garber will also direct two Public Health Service grants within the State Health Department. One is an immunization project and the other is a venereal disease control program.

Previously, Dr. Garber was an epidemic intelligence service officer for the United States Public Health Service assigned to Maryland.

Dr. Garber succeeds **John H. Janney, MD,** who will continue as a consultant to the division.

* * *

The *American Medical News* made its appearance with the July 7 issue. It succeeds the *AMA News,* which began in 1958 as a biweekly, became a weekly in 1965, and appeared 398 times in its 11-year existence.

From an initial circulation of 224,450, the newspaper has grown to its present press run of 350,000 copies weekly. It is received by physicians, students in the final three years of medical school, members of the allied health professions, and others.

Marvin L. Rowlands heads the staff and Dick Walt is executive director.

* * *

Richard Bauer, MD, has been named President of the Prince George's General Hospital Medical Staff. Named as Vice President was **William Holbrook, MD.**

Dr. Bauer, a past president of the Prince George's County Medical Society, is also past president of the Medical and Chirurgical Faculty of the State of Maryland. He is a graduate of Haverford College in Haverford, Pa., and received his MD degree from Jefferson Medical College.

* * *

The Surgeon General's Scientific Advisory Committee on Television and Social Behavior held its first organizational meeting in June 16-17, 1969, in Chevy Chase, Maryland. William H. Stewart, MD, US Public Health Service Surgeon General, gave the Committee its charge: ". . . provide consultation and guidance on a scientific study of the relationship between televised crime and violence and antisocial behavior, with special emphasis on children."

Dr. Stewart announced that Eli A. Rubinstein, MD, Assistant Director for Extramural Programs and Behavioral Sciences, National Institute of Mental Health, will be Vice Chairman and that Mr. Richard A. Moore, Special Consultant to the Secretary, Department of Health, Education, and Welfare, will provide coordination between the Committee and the Office of the Secretary.

* * *

Dr. Heptinstall

Robert H. Heptinstall, MD, has been named Baxley Professor of Pathology and director of the department of pathology at The Johns Hopkins University School of Medicine, and Pathologist-in-Chief for The Johns Hopkins Hospital. He assumed his new positions July 1, 1969.

Born in England, Dr. Heptinstall received his medical education at Charing Cross Hospital Medical School in London. He was an outstanding student, winning the class prizes in medicine and surgery during his second and third year.

* * *

The first total hip replacement with an American-designed prosthesis was performed on June 27 at the University of Maryland Hospital.

The patient, a 46-year-old Baltimore laborer, was the first person in Maryland to receive an entirely new hip—both the ball and the socket of the joint. In a more common operation, called a cup orthroplasty, a metal liner is placed in the hip socket.

Thomas H. Morgan, MD, who performed the operation using a prosthesis of his own design, headed the orthopedic unit at Princess Margaret Hospital in England before coming to Baltimore in 1966 to join the staff of the University of Maryland School of Medicine. Two hip models designed by British orthopedists are in use there, he said, and have been used to a limited degree in research programs in this country.

* * *

Herbert B. Copeland, MD, Nathan B. Hyman, MD, Albert B. Shackman, MD, Nathan Stofberg, MD, and **Martin J. Birnbaum, MD,** have announced the association of **Larry A. Snyder, MD,** in the private practice of diagnostic radiology.

* * *

Melvin B. Davis, MD, medical examiner for Baltimore County's southeast district and a general practitioner in Dundalk, has been appointed to the county Board of Health.

Dr. Davis received his medical degree from the University of Maryland School of Medicine in 1931, interned at the University Hospital, and studied anesthesiology at the Lahey Clinic in Boston.

* * *

Norton Spritz, MD, has been appointed Professor of Medicine at New York University School

of Medicine. A 1952 graduate of the University of Maryland School of Medicine, Dr. Spritz has held teaching and research appointments at Cornell University Medical College and The Rockefeller University.

* * *

The Maryland Tuberculosis and Respiratory Disease Association offers a free tuberculin test (Mantoux Intermediate PPD) to any person reporting to the Association Screening Clinic for a chest X-ray. The test will be given by a registered nurse and interpreted by the writer. A chest X-ray will be required of all persons over 15 years of age who are skin tested.

* * *

The American Academy of Pediatrics has taken a major step to improve the delivery of child health care in the United States by initiating a national program to train allied child health personnel, including pediatric nurse associates, pediatric office assistants, and pediatric aides.

To implement this program, the Academy Executive Board approved the establishment of a Division of Child Health Manpower within the AAP Central Office.

* * *

The development and extension of community-based facilities to treat and rehabilitate narcotic addicts has been given major impetus with the announcement of the availability of funds under a new program recently authorized by Congress.

Staffing grants are now available to nonprofit agencies for the operation of addict treatment and rehabilitation facilities.

The National Institute of Mental Health, which will administer the grant program, has issued preliminary guidelines to assist eligible community agencies in developing plans for treatment programs. Final regulations will be promulgated by the Department of Health, Education, and Welfare.

* * *

H. M. Robinson, MD, head of the division of dermatology, and **John H. Stone, MD,** senior resident in dermatology, University of Maryland School of Medicine, presented a paper at the July meeting of the American Medical Association in New York.

* * *

Joseph W. Burnett, MD, associate professor of dermatology, and **Drs. Ronald Goldner** and **Mouta Al-Dilaimy,** both residents in dermatology, University of Maryland School of Medicine, presented a paper at the meeting of the Society of Investigative Dermatology in New York, July 27.

The division of dermatology sponsored a symposium on "Rehabilitation in Dermatology" for physicians, attorneys, rehabilitation counselors, and social service workers on May 7.

* * *

Ephraim T. Lisansky, MD, associate professor of medicine, University of Maryland School of Medicine, participated in a conference in Colombia sponsored by the American College of Physicians in March.

* * *

Albert F. Heck, MD, associate professor of neurology, University of Maryland School of Medicine, was elected a fellow of the International College of Angiology.

* * *

Josephine Buca, assistant professor of physical therapy, will represent the University of Maryland School of Medicine on the advisory committee for the physical therapy assistants curriculum at the Community College of Baltimore.

* * *

Robert L. Derbyshire, MD, associate professor of sociology in psychiatry, and **Gerard Hunt, MD,** assistant professor of sociology in psychiatry, both of the University of Maryland, participated in the Southern Regional Education Board Conference on "Research in Adaptation of Migrants" in Atlanta, March 6-8.

* * *

Dr. Holcomb

Thomas H. Holcomb, MD, has been named Director of Pediatrics at the Franklin Square Hospital. Dr. Holcomb is a graduate of the University of Vermont College of Medicine and he has a Master of Public Health degree in maternal care and child health from The Johns Hopkins University School of Public Health and Hygiene. He completed his internship and residency at Vassar Brothers Hospital in Poughkeepsie, New York. He has also been a resident at Baltimore City Hospitals in pediatrics.

* * *

Frank T. Rafferty, MD, director of the division of child psychiatry at the University of Maryland School of Medicine, was one of three keynote speakers at a Legislative Forum in Raleigh, North Carolina, March 24-26.

* * *

Eugene B. Brody, MD, director of The Psychiatric Institute, has been appointed to the editorial board of *Mental Hygiene,* Journal of the National Association for Mental Health.

* * *

Virginia Huffer, MD, associate professor of psychiatry at the University of Maryland, has been appointed secretary of the Baltimore-District of Columbia Society for Psychoanalysis.

* * *

Naomi Rae-Grant, MD, assistant director of the division of child psychiatry at the University of Maryland School of Medicine presented a paper at the Alpha Omega Alpha meeting in New York, April 1.

* * *

Constantine Sakles, MD, assistant professor of psychiatry at the University of Maryland, delivered a paper at the annual meeting of the American Society of Group Psychotherapy and Psychodrama in New York, April 25.

* * *

William G. Esmond, MD, assistant professor of surgery at the University of Maryland, in association with **Thomas Regan, MD,** of the department of chemical engineering in College Park, presented a paper at the meeting of the American Chemical Society in Minneapolis, April 17.

* * *

Julio E. Alarcon, MD, resident in obstetrics and gynecology at the University of Maryland Hospital, was awarded both third prize and honorable mention in the 11th annual SAMA-EATON Medical Art Competition, sponsored by the Student American Medical Association and the Eaton Laboratories.

* * *

Jean Dockhorn, director of the department of social work at the University of Maryland Hospital, has been elected chairman of the newly organized Maryland Chapter of the American Society for Hospital Social Work Directors.

* * *

Margaret R. Gambrill, a doctoral candidate in microbiology was awarded the Graduate Prize of the University of Maryland's chapter of the American Association of University Women as the most outstanding woman doing predoctoral research at the university.

1969-1970 SCHEDULE OF POSTGRADUATE PROGRAMS
presented through
Medical Education's Dedicated Instructional Channel

SEPTEMBER 26, 1969 — 12:30 PM

USES AND ABUSES OF ANTIBIOTICS

Patricia Charache, MD
Assistant Professor of Medicine
The Johns Hopkins University School of Medicine

Large numbers of new antibiotics have been presented to the physician within the past few years, many associated with heavy advertising pressures. This discussion will consider methods of evaluating antibiotics in order to tailor drug usage to the needs of a particular patient and in order to avoid drug abuse.

2:00 PM

OCTOBER 3, 1969 — 12:30 PM

NURSERY CARE FOR THE NEWBORN

Marvin Cornblath, MD
Professor and Head
Department of Pediatrics
University of Maryland School of Medicine

The first minutes are the most critical in the life of the newborn. Having survived the first twenty-four hours, life expectancy is at the highest peak ever. Emphasis will be placed on the care of the newborn for the first minutes and hours of life.

PACEMAKERS

J. O'Neal Humphries, MD
Assistant Profressor of Medicine
The Johns Hopkins University School of Medicine

Artificial pacing is the preferred management for patients with symptoms due to complete heart block, including syncope, near-syncope, congestive failure, azotemia, confusion and lethargy. Acceptable reliability allows the continuous use of the pulse generator unit for two to two and one-half years. Artificial pacing may be the preferred method of management for selected patients with paroxysmal tachycardia or sinus bradycardia. Seven years experience with over 200 patients treated with permanent artificial pacemakers will be presented. Demand pacing through endocardial electrodes (position transvenously) is used in most instances at the present time.

OVARIAN DYSFUNCTION

Georgeanna Seegar Jones, MD
Associate Professor of Obstetrics and Gynecology
The Johns Hopkins University School of Medicine

Ovarian dysfunction can be clinically characterized by irregular or absent periods or prolonged or profuse menses. The decision as to whether or not the symptons require investigation or treatment must be made on the basis of the individual case. When primary amenorrhea exists, it is always important to determine if an associated abnormality of the genitalia exists. No intelligent approach can be made to therapy of ovarian dysfunction until a proper etiologic diagnosis has been obtained. With the addition of human pituitary gonadotrophin and clomiphene citrate to our therapeutic armimentarium, the results of therapy are more encouraging.

INTERPRETATION OF BRAIN SCANS

Frank H. DeLand, MD
Assistant Professor of Radiology
The Johns Hopkins University School of Medicine

The accumulation of experience over the past decade has enabled us to characterize abnormal accumulations of radioactivity. Histologic diagnosis cannot be made from the brain scans when an abnormal accumulation, as seen in a scan, is nonspecific. However, the nature of the lesion can be inferred based on its scan characteristics of size, shape, concentration of activity and location.

STERILIZATION, PREP AND ISOLATION TECHNIQUES

John J. White, MD
Assistant Professor of Pediatric Surgery
The Johns Hopkins University School of Medicine

It is becoming apparent that infections are more frequently due to organisms endogenous to the patient himself than to contamination from his surroundings. Current aseptic methods range from those based on established evidence, through those that lack good evidence but appear rational, to those that seem to be based on ritual. Prepping solutions and techniques, isolation and protection systems, and sterilization will be discussed.

PORTAL CIRRHOSIS

George Zuidema, MD
Professor of Surgery
The Johns Hopkins University School of Medicine

The major life-threatening complication of hepatic cirrhosis is hemorrhage from gastroesophageal varices. Precise diagnosis and aggressive primary care are essential in successful patient management. Although many methods have been employed, emergency portacaval anastomosis remains the best method for control of variceal hemorrhage and definitive treatment of portal hypertension. Portal decompression also has a role in control of intractable cirrhotic ascites.

THE DEPRESSED PATIENT

Frank Ayd, Jr., MD
Diplomate in Psychiatry
Baltimore, Maryland

Of all the ills to which man is heir, depression occurs with the greatest frequency. The objective of this presentation is to present the cardinal symptoms of endogenous melancholia and to review various methods of managing patients with this illness. Special attention is given to the art of using chemical remedies for melancholia.

INDICATIONS FOR TRACHEOSTOMY IN MEDICAL PATIENTS

Douglas G. Carroll, MD
Chief of Physical Medicine and Rehabilitation
Baltimore City Hospitals

Tracheostomy is being used increasingly in hospitalized medical patients for short term treatment of ventilatory insufficiencies and inability to clear secretions adequately. The indications and complications of tracheostomy will be discussed, based on experience at the Baltimore City Hospitals.

COIN LESION IN THE CHEST

Jack Love, MD
Chief of Thoracic and Cardiovascular Surgery
Baltimore City Hospitals
John R. Wright, MD
Assistant Chief of Pathology
Baltimore City Hospitals

In this discussion, a patient with a pulmonary coin lesion will be presented. The management and differential diagnosis of such a patient will be the center of concentration.

HISTOPLASMOSIS

Henry V. Chase, MD
Department of Medicine
Frederick Memorial Hospital

The early history of histoplasmosis will be discussed and illustrated, with emphasis on those aspects related to Maryland and Virginia. Epidemiological studies will be described and several recent surveys in this area will be mentioned. Available diagnostic tests and methods of treatment will be reviewed.

GRAM NEGATIVE SEPTICEMIA

Richard B. Hornick, MD
Assistant Professor of Medicine and
Director, Division of Infectious Diseases
University of Maryland School of Medicine

Infectious diseases caused by gram-negative rods have been emerging as the most common type of hospital acquired infection, as well as the most difficult to treat. Previously, *E. coli* was the most common offender but in recent years, the incidence of this has dropped and has been replaced by Klebsiella species and less common organisms like *Serratia Marscius.* New sources of organisms like humidifiers have caused gram-negative rod respiratory infections. New trends in the management of these serious illnesses will be discussed.

SCIENTIFIC EXHIBITS

The scientific exhibits are an integral part of the Annual Meeting of the Medical and Chirurgical Faculty. All physicians who have a scientific exhibit are urged to fill in the application below for the next Annual Meeting, which will be held

APRIL 1, 2, 3, 1970

The Alcazar, Baltimore

As space is limited, it is suggested that applications be submitted as soon as possible.

RULES GOVERNING SCIENTIFIC EXHIBITS

The following rules govern the selection and conduct of scientific exhibits:

1. Each exhibitor shall be fully responsible for the content, arrangement, presentation, setting up, and dismantling of his exhibit.
2. Cost of transportation of exhibit to and from the meeting must be borne by the exhibitor.
3. The Medical and Chirurgical Faculty will provide, without cost to the exhibitor, a backdrop and side rails for the booth, and 1000 watt electric current outlets.
4. MOTION AND SOUND MAY BE USED ONLY IF THEY DO NOT DETRACT FROM OTHER EXHIBITS, DISTURB THOSE IN ROOM, OR INTERFERE WITH TELEPHONES.
5. No reference to, or credit for, financial aid shall be shown on the exhibit.
6. Only generic names may be used, and shall not exceed one inch in height. NO TRADE NAMES are permissible.
7. Each exhibit should be manned at all times by someone thoroughly familiar with its content.
8. Exhibitors are urged to discuss their displays and work with the physicians and students.
9. The Medical and Chirurgical Faculty reserves the right to approve or reject any exhibit without recourse.

APPLICATION FOR SCIENTIFIC EXHIBIT SPACE

Fill in and mail to: Chairman, Exhibit Subcommittee
Medical and Chirurgical Faculty
1211 Cathedral Street, Baltimore, Md. 21201

1. Title of exhibit: _____

_____

2. Please attach a 50-100 word description of the exhibit: _____

3. Give amount of space required, depth, width, and height: _____

If exhibit has side panels, are depth and width included above? _____

If not, what additional space is required? _____

4. Electrical or other requirements: _____

_____

5. Has exhibit been shown at other medical meetings? _____

_____

6. Name and title of exhibitor: _____

_____

7. Name of institution cooperating in the exhibit: _____

_____

8. Address of exhibitor: _____

SEE RULES GOVERNING SCIENTIFIC EXHIBITS

AHA Editorial: "Hospitals Challenged by Poor"

Comprehensive health care for all will only be achieved when the providers of health services become totally involved with the people they seek to serve, an editorial in the July 1 issue of HOSPITALS, Journal of the American Hospital Association, declares.

The AHA editorial points out that the nation's hospitals are being challenged by poor people to use their resources and ability to respond both to health needs and to other social needs.

The entire issue of HOSPITALS is devoted to the delivery of health care services to the poor. Articles explore the need for hospital involvement in delivering those services, and discuss ways in which hospitals can take a leading role in producing the best possible system of comprehensive health care.

According to the editorial, "massive attacks on the nation's health problems through Medicare, Medicaid and Regional Medical Programs, etc. have helped those least who need help most."

"White middle-class society still hasn't completed its lesson on social equality of different ethnic groups," the editorial says, "although the providers of governmental service are beginning to realize that the only way to govern peacefully in a democratic society is to ensure involvement of all the groups governed."

The editorial adds: "The lesson to providers of health care is the same—involvement. Only by involvement of and with all recipients of care and all who need care can we actually accomplish comprehensive care. And adequate involvement cannot be achieved by any system, health or otherwise, that fails to see its relationship to the totality of its community —the spiritual, financial, and social elements as well as the health elements."

Now When You Recommend Moist Heat,

Recommend Automatic Moist Heat.

Until now, application of moist heat required boiling water, hot towels, and somebody to apply them. The Battle Creek THERMOPHORE changes all that. It provides instant and automatic moist heat, intensely hot, deeply penetrating.
The patient simply plugs it into an outlet. This unique hot fomentation pad then generates its own moisture from the air. Intensely hot moist heat is constantly maintained, and evenly distributed throughout the pad. No water is needed, no filling or emptying is required.
Large 13" x 27" pad covers back, or chest and abdomen, or both legs. Safety thermostat turns it off automatically, prevents overheating.
Price is **$35.00.** Also available in medium size 13 x 13 **$25.00.**

When it's more than a bad cold

your patient can feel better while he's getting better

Achrocidin®

Tetracycline HCl—Antihistamine—Analgesic Compound

Each tablet contains: ACHROMYCIN® Tetracycline HCl 125 mg.; Phenacetin 120 mg.; Caffeine 30 mg.; Salicylamide 150 mg.; Chlorothen citrate 25 mg.

In tetracycline-sensitive bacterial infection complicating respiratory allergy, ACHROCIDIN brings the treatment together in a single prescription—prompt relief of headache and congestion together with effective control of the organisms frequently responsible for complications leading to prolonged disability in the susceptible patient.

For children and elderly patients you may prefer caffeine-free ACHROCIDIN Syrup. Each 5 cc contains: ACHROMYCIN (Tetracycline) equivalent to Tetracycline HCl 125 mg.; Phenacetin 120 mg.; Salicylamide 150 mg.; Ascorbic Acid (C) 25 mg.; Pyrilamine Maleate 15 mg.

Contraindications: Hypersensitivity to any component.

Warning: In renal impairment, since liver toxicity is possible, lower doses are indicated; during prolonged therapy consider serum level determinations. Photodynamic reaction to sunlight may occur in hypersensitive persons. Photosensitive individuals should avoid exposure; discontinue treatment if skin discomfort occurs.

Precautions: Drowsiness, anorexia, slight gastric distress can occur. In excessive drowsiness, consider longer dosage intervals. Persons on full dosage should not operate vehicles. Nonsusceptible organisms may overgrow; treat superinfection appropriately. Treat beta-hemolytic streptococcal infections at least 10 days to help prevent rheumatic fever or acute glomerulonephritis. Tetracycline may form a stable calcium complex in bone-forming tissue and may cause dental staining during tooth development (last half of pregnancy, neonatal period, infancy, early childhood).

Adverse Reactions: *Gastrointestinal*—anorexia, nausea, vomiting, diarrhea, stomatitis, glossitis, enterocolitis, pruritus ani. *Skin*—maculopapular and erythematous rashes; exfoliative dermatitis; photosensitivity; onycholysis, nail discoloration. *Kidney*—dose-related rise in BUN. *Hypersensitivity* reactions—urticaria, angioneurotic edema, anaphylaxis. *Intracranial*—bulging fontanels in young infants. *Teeth*—yellow-brown staining; enamel hypoplasia. *Blood*—anemia, thrombocytopenic purpura, neutropenia, eosinophilia. *Liver*—cholestasis at high dosage.

Upon adverse reaction, stop medication and treat appropriately.

Our travel-pak for summer cold and allergy sufferers.

lovahistine LP can speed your atients on their way, by providing rompt and continuous relief from the ymptoms of summer colds and llergies. These continuous-release ablets contain a vasoconstrictor-ntihistamine formulation that goes to vork rapidly and lasts for hours. ven when nasal congestion is caused y repeated allergic episodes, the onvenient twice-a-day dosage of lovahistine LP makes it easy for most patients to enjoy relief all day and all night. When symptoms are severe, a third dose of one or two tablets may be safely given. Use with caution in patients with severe hypertension, diabetes mellitus, hyperthyroidism or urinary retention. Caution ambulatory patients that drowsiness may result.

PITMAN-MOORE Division of The Dow Chemical Company, Indianapolis, Indiana.

Novahistine® LP decongestant

(Each tablet contains 25 mg. of phenylephrine hydrochloride and 4 mg. of chlorpheniramine maleate.)

DOW

For elderly patients
in need of a mild tranquilizer
consider **Tybatran**®
brand of tybamate

(When you consult
the Prescribing Information
you may agree
it makes good sense)

PRESCRIBING INFORMATION

Indications: Tybatran (tybamate) has afforded symptomatic improvement in a variety of psychoneurotic disorders, especially in the treatment of the anxiety and tension components of psychoneuroses. Anxiety states manifested somatically have responded to Tybatran (tybamate).

Tybatran (tybamate) has been useful in the control of agitation in the aged and in the alleviation of some of the adverse emotional accompaniments of senility.

Tybatran (tybamate) has been used with benefit in the treatment of depressive symptoms associated with anxiety and other symptoms of psychoneuroses. However, it is not indicated for primary treatment of depressive states. It is not an antipsychotic agent, although it has been used as adjunctive therapy in some psychotic patients.

Dosage: One 350 mg. capsule, 3 times daily and two at bedtime is suggested as the adult starting dose. Adjust to suit individual requirements. Daily doses above 3000 mg. are not recommended.

Contraindications: Known hypersensitivity to tybamate. Since no studies have been done with this drug in human pregnancy, it should not be used in pregnancy unless the potential benefit outweighs the risk.

Warnings: Administer cautiously to patients receiving phenothiazines or other CNS depressants or having history of convulsive seizures (See Adverse Reactions). Consider possibility of additive actions with alcohol or other psychotropic agents, particularly phenothiazines or MAO inhibitors.

Precautions: Avoid abrupt withdrawal after prolonged use, although withdrawal symptoms have not been reported to date. Exercise caution in addiction-prone individuals. If symptoms of hypersensitivity occur, discontinue at once and initiate appropriate symptomatic treatment. Avoid activities requiring optimal mental alertness if drowsiness or vertigo are present. As with any new drug, use cautiously in patients with history of drug allergies, blood dyscrasias, and hepatic or renal disease; periodic measurements of hepatic, hematopoietic and renal function should accompany prolonged and/or high doses.

Adverse Reactions: Most frequent reactions, rarely requiring discontinuation of tybamate, include drowsiness, dizziness, nausea, insomnia, and euphoria. There have been a few reports of skin rash, urticaria, and pruritus. Rare side effects include hyperactivity, fidgetiness, flushing, and tachycardia, suggesting excessive stimulation; also ataxia, unsteadiness, confusion, feeling of unreality, "panic reaction," fatigue, headache, paresthesias, vertigo, gastrointestinal disturbances, glossitis, and dry mouth. Grand mal or petit mal seizures have been reported in a few hospitalized psychotic patients receiving tybamate (up to 6000 mg. daily) together with phenothiazines and other psychotropic agents, but not with tybamate alone. Consider the possibility of rare, serious adverse reactions such as may occur with the related drug, meprobamate. If excessive amounts are ingested, gastric lavage and symptomatic therapy, including central stimulants as necessary, are recommended. Before prescribing, consult package circular.

Supply: Tybatran (tybamate) is available in green, sealed capsules of three strengths: 350 mg., 250 mg., and 125 mg. Each strength is supplied in bottles of 100 and 500.

—The lowest priced tetracycline—nystatin combination available—

an antibiotic you can use without risk to the kidney

Polycillin-N®

(sodium ampicillin)

the penicillin you use like a broad-spectrum antibiotic

PRESCRIBING INFORMATION. 11—1/2/69. For complete information consult Official Package Circular.

Indications: Infections due to susceptible strains of Gram-negative bacteria (including Shigellae, *S. typhosa* and other Salmonellae, *E. coli, H. influenzae, P. mirabilis, N. gonorrhoeae* and *N. meningitidis*) and Gram-positive bacteria (including streptococci, pneumococci and nonpenicillinase-producing staphylococci).

Contraindications: A history of allergic reactions to penicillins or cephalosporins and infections due to penicillinase-producing organisms.

Precautions: Typical penicillin-allergic reactions may occur, especially in hypersensitive patients. Mycotic or bacterial superinfections may occur. Experience in newborn and premature infants is limited and caution should be used in treatment, with frequent organ function evaluations. Safety for use in pregnancy is not established. In gonorrheal therapy, serologic tests for syphilis should be performed initially and monthly for 4 months. Assess renal, hepatic and hematopoietic function intermittently during long-term therapy.

Adverse Reactions: Skin rash, pruritus, urticaria, nausea, vomiting, diarrhea and anaphylactic reactions. Mild transient elevations of SGOT or SGPT have been noted. Black tongue has been noted in some patients receiving the Chewable Tablets.

Usual Dosage: Adults—250 or 500 mg. q. 6 h. (according to infection site and offending organisms). Children—50-100 mg./Kg./day in 3 to 4 divided doses (depending on infection site and offending organisms). Bacterial meningitis—150-200 mg./Kg./day in 6 to 8 divided doses. Children weighing more than 20 Kg. should be given an adult dose when prescribing orally. In parenteral administration, children weighing more than 40 Kg. should be given an adult dose. Beta-hemolytic streptococcal infections should be treated for at least 10 days.

Supplied: Capsules—250 mg. in bottles of 24 and 100. 500 mg. in bottles of 16 and 100. For Oral Suspension—125 mg./5 ml. in 60, 80 and 150 ml. bottles. 250 mg./5 ml. in 80 and 150 ml. bottles. Chewable Tablets—125 mg. in bottles of 40. Injectable—for I.M./I.V. use—vials of 125 mg., 250 mg., 500 mg., and 1 Gm. Pediatric Drops—100 mg./ml. in 20 ml. bottles. **A.H.F.S. Category 8:12.16**

BRISTOL

BRISTOL LABORATORIES
Division of Bristol-Myers Company
Syracuse, New York 13201

Indications: For the treatment of trichomoniasis in both male and female patients and the sexual partners of patients with a recurrence of the infection provided trichomonads have been demonstrated by wet smear or culture.
Contraindications: Evidence of or a history of blood dyscrasia, in patients with active organic disease of the central nervous system, and the first trimester of pregnancy.
Warnings: Use with discretion during the second and third trimesters of pregnancy and restrict to patients not cured by topical measures. Flagyl (metronidazole) is secreted in the breast milk of nursing mothers; it is not known whether this can be injurious to the newborn.
Precautions: Mild leukopenia has been reported during Flagyl use; total and differential leukocyte counts are recommended before and after treatment with the drug, especially if a second course is necessary. Avoid alcoholic beverages during Flagyl therapy because abdominal cramps, vomiting and flushing may occur. Discontinue Flagyl promptly if abnormal neurologic signs occur. There is no accepted proof that Flagyl is effective against other organisms and it should not be used in the treatment of other conditions. Exacerbation of moniliasis may occur.
Adverse Reactions: Nausea, headache, anorexia, vomiting, diarrhea, epigastric distress, abdominal cramping, constipation, a metallic, sharp and unpleasant taste, furry or sore tongue, glossitis and stomatitis possibly associated with a sudden overgrowth of *Monilia,* exacerbation of vaginal moniliasis, an occasional reversible moderate leukopenia, dizziness, vertigo, drowsiness, incoordination and ataxia, numbness or paresthesia of an extremity, fleeting joint pains, confusion, irritability, depression, insomnia, mild erythematous eruptions, "weak-

Flagyl®
brand of
metronidazole

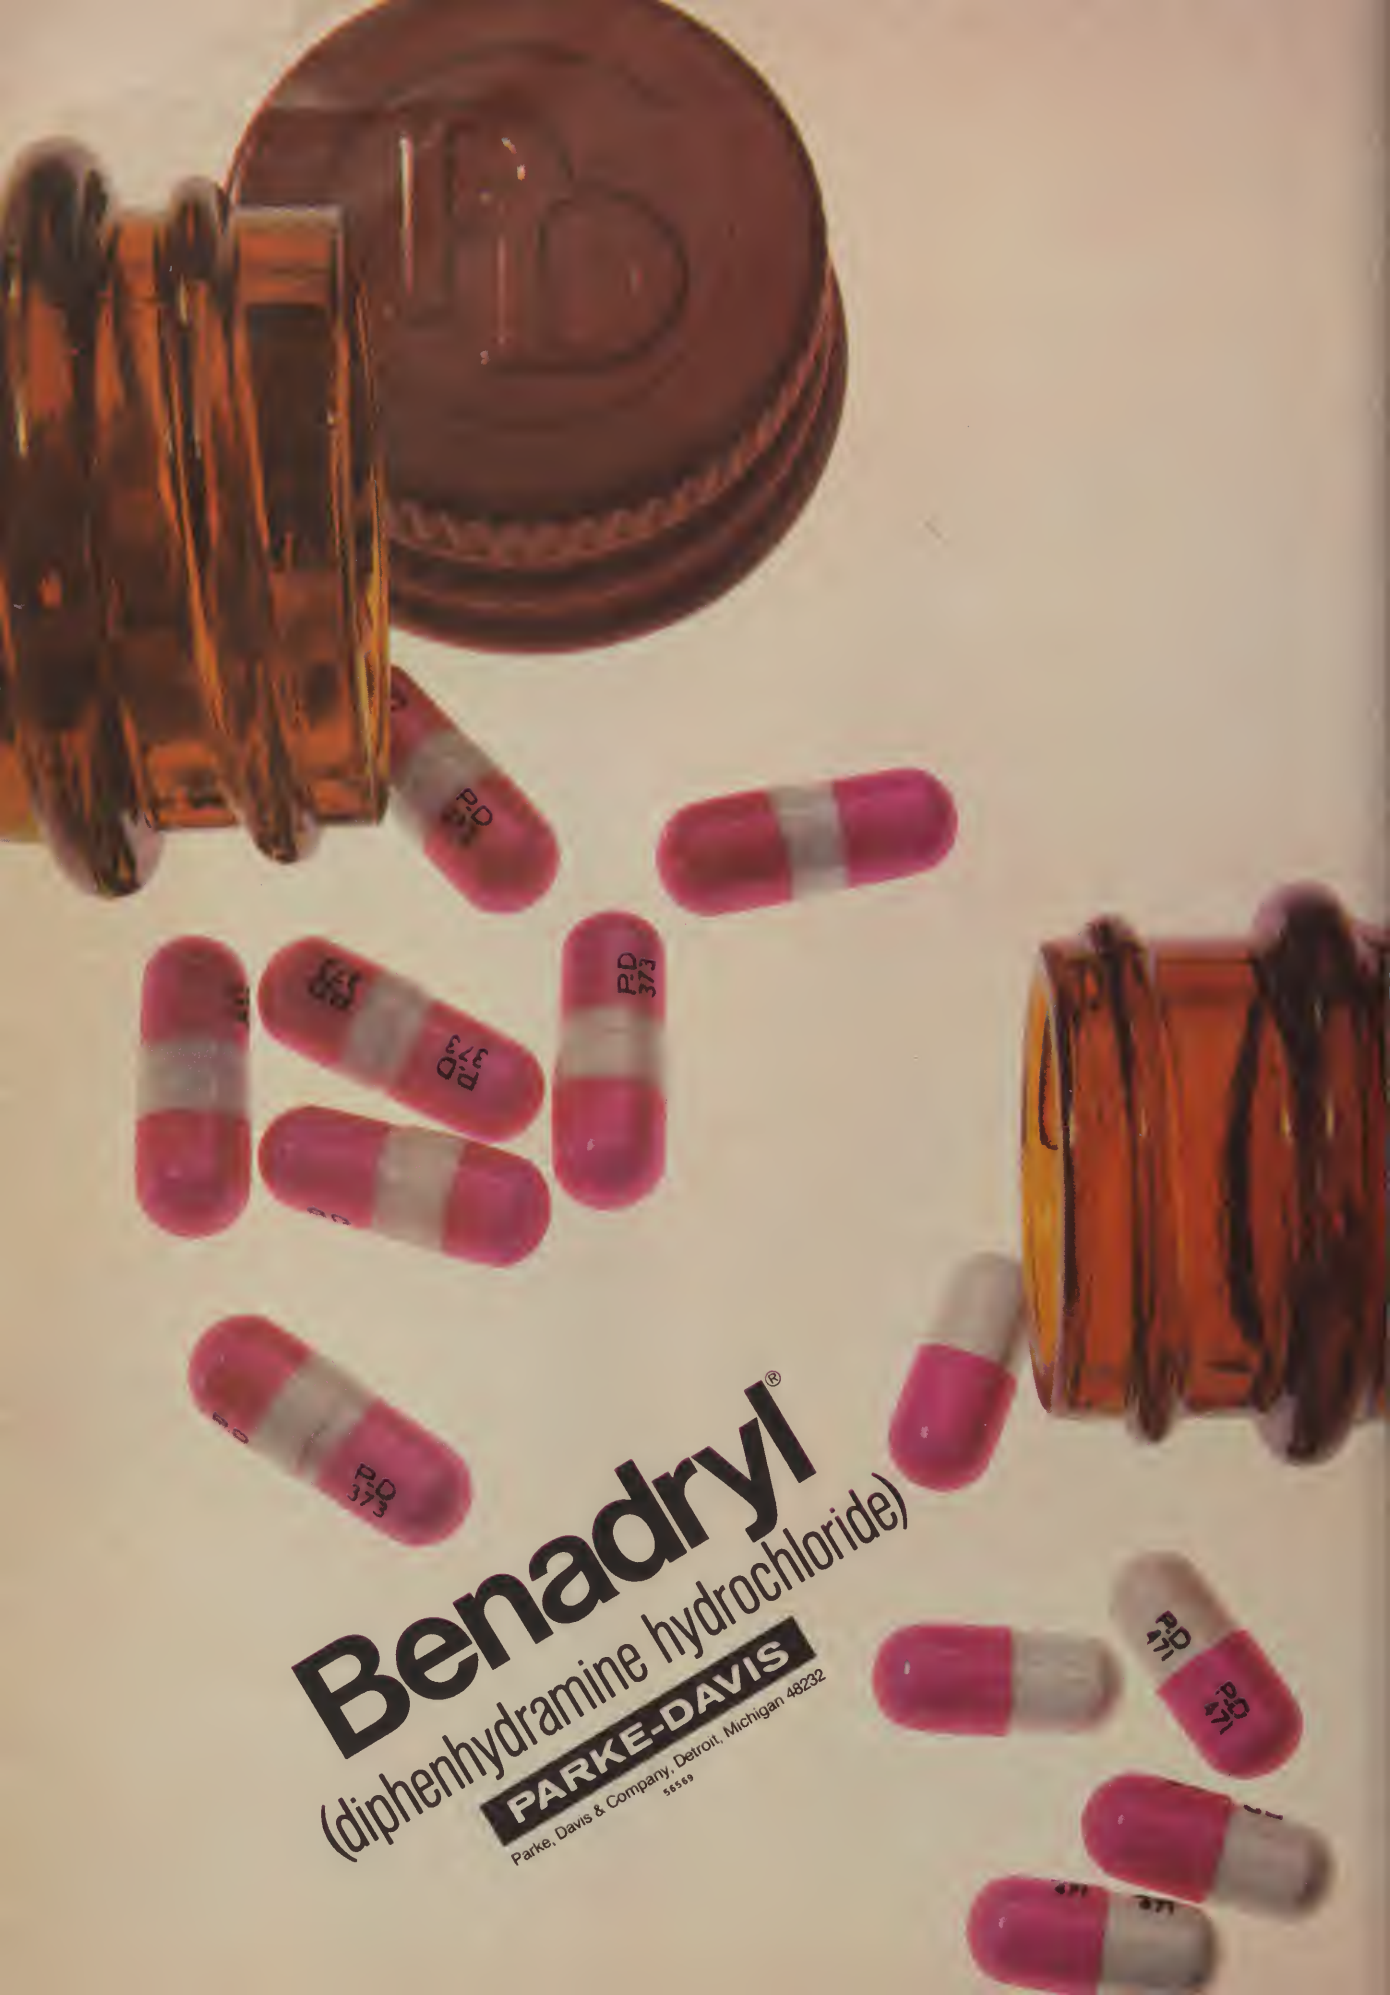
simplifies vaginitis therapy

The effectiveness of Flagyl in *Trichomonas vaginalis* vaginitis has been so constant that use of less effective agents would seem to invite unnecessary failures. ▪ The simplicity, completeness and persistence of cures with Flagyl qualify it as the logical first therapeutic choice in trichomonal infections.

simple Ten-day treatment with Flagyl oral tablets has replaced a multitude of untidy douches, powders, creams and jellies.

complete Flagyl is the only medication available that is able to reach all the crypts, glands and cavities of the female urogenital system as well as reservoirs of reinfection in male trichomonas carriers.

lasting Flagyl eradicates resistant, deep-seated invasions of *Trichomonas vaginalis* and consistently produces cure rates above 90 per cent and often as high as 100 per cent in large series of patients. When the diagnosis is positive, Flagyl is positive.



ness," urticaria, flushing, dryness of the mouth, vagina or vulva, vaginal burning, pruritus, dysuria, cystitis, a sense of pelvic pressure, dyspareunia, fever, polyuria, incontinence, decrease of libido, nasal congestion, proctitis, pyuria and darkened urine have occurred in patients receiving the drug. Patients receiving Flagyl may experience abdominal distress, nausea, vomiting or headache if alcoholic beverages are consumed. The taste of alcoholic beverages may also be modified.

Dosage and Administration: In the Female. One 250-mg. tablet orally three times daily for ten days. Courses may be repeated if required in especially stubborn cases; in such patients an interval of four to six weeks between courses and total and differential leukocyte counts before, during and after treatment are recommended. Vaginal inserts of 500 mg. are available for use, particularly in stubborn cases. *When the vaginal inserts are used,* one 500-mg. insert is placed high in the vaginal vault each day for ten days and the *oral dosage is reduced to two 250-mg. tablets daily during the ten-day course of treatment.* Do not use the vaginal inserts as the *sole* form of therapy. *In the Male.* Prescribe Flagyl only when trichomonads are demonstrated in the urogenital tract, one 250-mg. tablet two times daily for ten days. Flagyl should be taken by both partners over the same ten-day period when it is prescribed for the male in conjunction with the treatment of his female partner.

Dosage Forms: Oral tablets .....250 mg.
Vaginal Inserts ...500 mg.

Letters to the Editor:

In Answer to the June Editorial

Dear Sir:

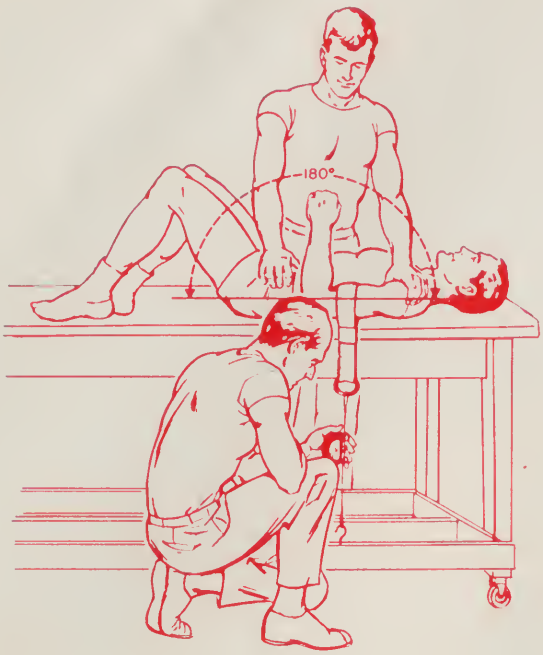
I read with interest the article by Dr. John F. Schaefer in your June 1969 issue concerning the problems surrounding the services of out of state laboratories.

Let me say from the start that I believe that the tone of the article is unfortunate. Little is achieved by getting mad. A case is generally weakened by the loss of emotional control.

I agree with much that Dr. Schaefer has to say. However, there are some weak points. Although the pathologist technically qualifies as a consultant, he rarely functions as such when his laboratory performs routine tests. He does not see the patient; he does not get the history; he seldom performs the test. Even if he sees the test results he does not interpret them in the light of the over-all picture. This interpretation is left up to the physician who orders the test in most cases. Therefore, in many instances the pathologist functions as a technician who presents the responsible physician with helpful data, just as a nurse who takes a bloodpressure or a temperature. Many people could say with some foundation that the function of a medical laboratory is more technical than consulting.

The article fails to mention that there is a real problem in this area for the practicing physician. My private-pathologist laboratory is not as convenient as Dr. Schaefer makes me believe his is. My patients often have to wait; they have to make a special trip to get there; they have a terrible time finding a parking place. I do use this laboratory, don't misunderstand me, and many others with me do. When I send a patient over for a few simple tests, say a bloodsugar, BUN, cholesterol, uric acid, and a bloodcount, my patient ends up with a $25.00 bill. Some of my colleagues in town obtain twice as many tests for half the money from the out-of-state laboratory. Their tests are generally reliable since they use a good, honest, well-qualified laboratory. All this is hard to explain to a patient. Is a one-dollar-bloodsugar less good than a five-dollar-one? And don't forget the time a patient spends waiting in, and going to the laboratory.

The cost of medical care is tremendous. Much of this is justified. We have an obligation to our patients to eliminate excessive cost. If a commercial laboratory can do the same thing for less than half the cost we should at least stop and think. Are we defending the status quo? Or should we tell our pathologist-friends to get up and do something about all this? Shouldn't they modernize their equipment, shouldn't they pool their resources, shouldn't they eliminate small volume, inefficient, slow methods? Let's at least admit that some of the modern, large volume, commercial laboratories have a point. Let's try doing something about this instead of getting mad.



I certainly agree that some of the out-of-state laboratories seem to use unethical methods of advertising, that some of them are unreliable, that many of them do not offer all the benefits of the local pathologist run laboratories. However, I do feel that we are facing a problem here that needs a solution. This solution is not achieved by the type of article that Dr. Schaefer writes.

I am writing this letter because I am concerned. I am not related to any laboratory. I feel that I have an obligation to my patients to offer them the best possible care utilizing his money prudently.

I should appreciate some official action by the Maryland state medical society that indicates concern for the patient, for his money, and for the practicing physician. I read in Dr. Schaefer's article concern for his pathologist-friends only.

Sincerely yours,
Peter F. Verkouw, MD
Annapolis

(Dr. Verkouw has overlooked the very active part the Faculty has played in establishing the Commission on Medical Discipline, which has a specific section dealing with "exploitation of the patient." He probably did not read the letter sent to all members under date of April 30, 1969, by the Faculty President which clearly spells out what is ethical and what is unethical in the billing of patients by physicians for laboratory services. There are probably just as many individual physicians who disagree with Dr. Verkouw's viewpoint as there are with mine. But that is what makes and has made American medicine great.—JFS)

At left: This is a test for shoulder flexion—the mean strength is obtained by flexing the biceps muscle in the shoulder adduction movement.

At right: The test for measuring back lift is another test of strength. The subject bends slightly forward, with knees straight, and grasps the bar near the ends. The grip is mixed, one hand forward and one hand backward. The subject is asked to lift straight up. The strength in poundage is measured by the dial.

The following papers were presented at the Second Annual Medical Aspects of Sports Seminar, held August 1968 at the Catonsville Community College, Catonsville, Maryland. The Seminar was sponsored by the Medical and Chirurgical Faculty of the State of Maryland and the Division of Health, Physical Education and Recreation of Catonsville Community College.

Measurement of Physical Fitness

Introduction to a Dilemma

Even a cursory survey of both professional and lay literature will evidence an overwhelming interest in "physical fitness." Indeed, the interest in and concern for fitness prompted the late President Eisenhower to create the Council on Youth Fitness now designated as the President's Council on Physical Fitness. Thus, in addition to the pleas of physical educators and physicians, even governmental agencies are urging both children and adults to achieve and maintain physical fitness.

EDWARD N. NORRIS, EdD, RPT
Associate Professor of Health and Physical Education
West Chester State College
West Chester, Pennsylvania

Paradoxical as it may seem, one is unable to find anywhere a universally accepted definition of "physical fitness" or a specific description of its desired state. Although some writers offer definitions, they are invariably vague, too broad, too general, or too simple for infallible application. Examples of such attempts at definition are: *"Physical fitness* is a capacity for sustained physical activity"[1], and "Physical fitness may be defined as the capacity to do physical work and to recover quickly and completely from doing this work."[2] If one attempts to use such definitions in clinical work, including physical education and coaching, or in laboratory research, the lack of precision becomes readily apparent.

The problem of definition results from the generic, complex and relative character of the term "fitness." This is evident in the statement by the Joint Committee of the American Medical Association and the American Association for Health, Physical Education and Recreation that

> **"Fitness for effective living has many interdependent components involving intellectual and emotional, as well as physical factors. These differ in relative importance from one period of life to another depending upon varying individual roles and responsibilities. But in every part of life, each of these factors is significant."[3]**

Thus, it is precisely because of these "interdependent components" that no *one* definition is universally accepted. Indeed, it is entirely possible that "physical fitness" may never be defined precisely as a single entity, the plea for arbitrary definitions notwithstanding.[4]

The dilemma in any attempt to measure "physical fitness" is now obvious: How can we evaluate or measure that which we cannot even define with precision? In this context one writer has stated:

> **"Until the time comes when the definition of fitness is agreed upon and we have the instruments for objectively measuring it, there will continue to be confusion as to what is the best evaluative approach to this problem."[5]**

Components and Levels of Physical Fitness

The fact that there is no universally accepted definition of "physical fitness" and that many of the definitions that have been proposed lack specificity, does not preclude the possibility and the value of factoring out selected components of fitness for detailed description and evaluation. It seems that many authorities have done exactly this as an alternative to the lack of definition. Indeed, there are almost as many ways of categorizing the components of physical fitness as there are exercise physiologists.

At this point in time, I arbitrarily select the components of fitness as outlined by de Vries[4] as being appropriate for discussion if not omnipotent and eternal in character. This outstanding physiologist views physical fitness as having two major components: (1) motor fitness; and (2) physical working capacity. He identifies motor fitness, which has been a major concern of the physical educator as consisting of strength, speed, agility, endurance, power, coordination, balance, flexibility, and body control. Physical Working Capacity (PWC), which has been a major concern of the medical profession includes such elements as cardiovascular function, respiratory function, muscular efficiency, strength, muscular endurance and obesity. Of more than incidental interest is de Vries suggestion that the PWC concept should receive wider consideration in the physical education profession.[4]

Accepting these components of physical fitness, the problem then becomes one of identifying the degree to which each is desirable. For example, what is an optimum level of strength? What is an acceptable criterion of adequate cardiovascular function? It is immediately obvious that these are not simple questions as the requirements will vary with the particular individual under consideration and with the specific task he is expected to complete. Thus, one writer has been prompted to state that "at present, fitness has established meaning only in terms of the task to be accomplished."[6] This point of view enjoys wide acceptance in the literature. Certainly no one will disagree with the idea that a professional athlete probably requires greater strength than a bank teller or that a gymnast needs a greater upper extremity strength than a distance runner. Thus, the relative importance of each component, the level to which each component is to be developed, and indeed the anatomic area to be developed depends wholly on the total life situation of the specific individual being evaluated. This leads to the simple, although practical conclusion, that, although many of the aspects of fitness can be measured in highly objective terms, no one can write a blanket prescription for the optimum level to which each should be developed.

Subjective Evaluation of Physical Fitness

At this juncture, prior to reviewing some of the objective methods of evaluating fitness, it is of some value to be reminded that the subjective judgment of an expert is not without validity. Certainly a swimming coach can factor out some components of fitness such as skill, strength, and endurance for subjective evaluation and make some assessment of the adequacy of each. In like fashion, a football or basketball coach can certainly make some equally valid—although subjective—judgments about the fitness components of the members of his squad. After all, the proof is in the pudding: the actual performance in the task speaks very profoundly about the fitness for that task.

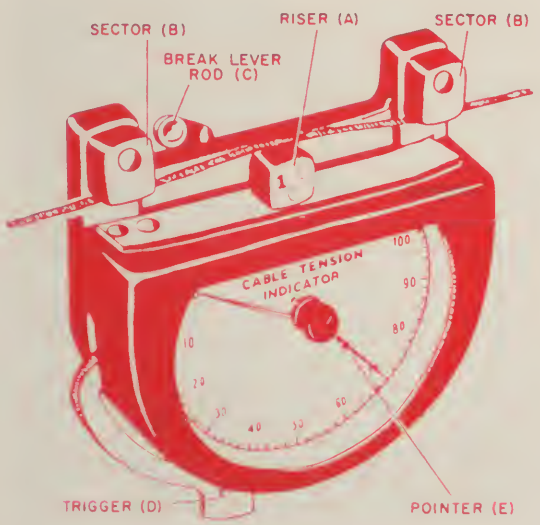
Subjective judgment also has value in the field of medicine. Certainly it can be agreed that the physician should also evaluate fitness for the task, ie, the daily requirements of the patient's total life situation. Even though the physician cannot observe directly the daily activities of his patients in the same manner that a coach can observe the performance of his athletes, he can ask questions relative to performance and make some judgments accordingly. Some appropriate questions concerning his patients have been suggested:

> **"What are his current activities? What were his activities in the past? How do they differ from his present ones? Does he have any symptoms suggesting untoward reactions to exercise? How long does it take him to recover from strenuous exercise?"[7]**

Although subjective evaluations are frowned upon in the research laboratory, until more adequate and easily administered objective techniques become available, subjective judgments will continue to be important in the "field."

Objective Measures of Motor Fitness

It is beyond the scope of this paper to present a comprehensive survey of all of the objective techniques available to measure the components of motor fitness as previously outlined. Concerning these varied aspects, de Vries himself has stated:



> **"The elements of motor fitness are so many, however, and some are so difficult to define, that each motor performance test battery must be considered a compromise between the ideal of measuring all identifiable elements and the practical need to choose a number of represent-**

ative elements, which allows measurement in reasonable amounts of time."[4]

Quite arbitrarily, therefore, the writer has elected to merely highlight *some* of the techniques to evaluate *some* of the components of motor fitness. This approach seems justified in that there are many fine textbooks and voluminous periodical literature available for the interested reader. More important, however, it is justified so that more time and attention can be devoted to the PWC concept which is probably of greater significance to any overall fitness appraisal.

Of all of the elements of motor fitness, muscular strength and endurance are perhaps of overriding importance. Although strength and endurance are probably related in ways not, as yet, fully understood, one can differentiate between them by definition and therefore can evaluate them separately. Strength can be defined as the amount of rotary force a muscle or a muscle group can produce about a joint in a single maximal effort. Muscular endurance, on the other hand, is the ability of a muscle or a muscle group to produce repetitive or sustained submaximal contractions. Within this context, therefore, numbers of chins or numbers of push-ups are not measures of strength. The fact that at least one push-up or chin can be accomplished is an index of pass or fail strength, but two or more become an index of muscular endurance.

If one wishes to be more precise in the evaluation of muscular strength one can perform a series of single contractions interspersed with significant rest periods against some form of weight or resistance. Maximal isotonic strength is identified when the maximum weight that can be lifted in a single effort is reached. Repeated single contractions can be eliminated by using one of several types of dynamometers or by use of a cable tensiometer which permits direct reading of isometric strength in force units.

Muscular endurance can be measured with some precision by counting the number of chins or push-ups or by noting the time one can perform a bent arm hang, for example. For greater precision, however, one might count the number of contractions that can be performed against some specified external force or resistance at some predetermined cadence.

Another element of motor fitness, power, is sometimes confused with strength. The difference is that power incorporates a time element, whereas strength is based upon a single maximal effort regardless of speed or time spent in the application of that effort. Power consists of both strength and speed and is frequently expressed in horsepower. One can easily see, therefore, why the standing broad jump, jump and reach tests and putting the shot are viewed as measures of power.

Flexibility is a rather simple concept that lends itself to easy measurement. If one is not satisfied with subjective judgment which, in estimating flexibility, is rather good, one can use the well-known goniometer to quantity joint angles and joint movement. A more recent device, the Leighton Flexometer, is also available for measuring joint range of movement or flexibility.

Flexibility Tests

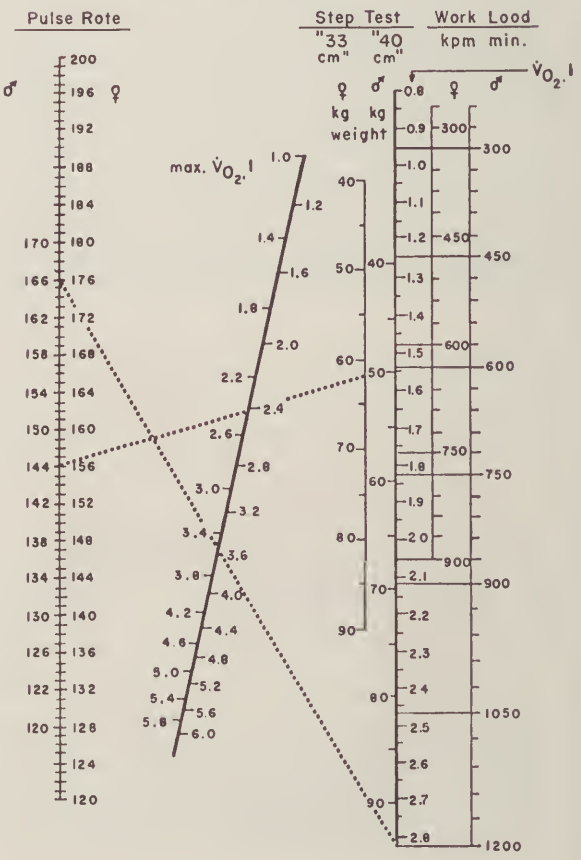
Above is the Leighton Flexometer. This is an instrument used for objectively measuring the flexibility of the joint movements. The instrument has a weighted 360° dial and a weighted pointer. The dial and the pointer operate free and independently; the movement of each is controlled by gravity. The instrument will record movement while in any position off the horizontal.

At left is the cable tensiometer. This small compact unit was originally designed to test the tension of aircraft control cables. Cable tension is determined by measuring the force applied to a riser and causing an offset in a cable stretched taut between two sectors. The tension is then converted into pounds on a calibration chart supplied with the instrument. The test is used for testing the strength and flexibility in various muscle groups.

Because they probably rely on more exquisite integration within the nervous system, speed, agility, coordination and balance are more complex concepts than strength, endurance and flexibility. There does not seem to be any one test or technique that can be used to assess the basic quality of any one of these. Although one may describe a subject as having good speed, good agility, good coordination and good balance, it is doubtful that these are truly general qualities. Rather, they are probably highly task-orientated and should be measured, therefore, only in relationship to a specific activity. de Vries [4] reminds us that, in the case of speed for example, there is essentially no correlation between speed of movement of different limbs, or between different movements of the same limb. Suffice it is to say that, as yet, we do not have sufficient knowledge of speed, agility, coordination or balance to design any test that can measure these attributes in a general way.

Thy Physical Working Capacity

Probably the most significant and fundamental concept in measuring physical fitness is the physical working capacity (PWC). Defined ". . . as the maximum level of metabolism (work) of which an individual is capable," [4] it provides an opportunity to evaluate a complex chain of physiological events in a single score or index. To measure lung vital capacity, total hemoglobin, maximal cardiac output, or height and weight provides only a partial picture of physiological capability. The total picture would be an expression of the actual physical work performed or the ability to take in and use oxygen upon which the ability to perform work is dependent.



Although there are several ways in which the overall oxygen transport function can be expressed, the maximal oxygen uptake is most widely accepted. Indeed, so many writers [8] have concluded that the maximal oxygen uptake is the best single indicator of cardiovascular or circulo-respiratory fitness that it becomes a validating criterion for other tests of physical working capacity.

Unfortunately, the actual measurement of maximal oxygen uptake is a complicated and time-consuming procedure requiring rather expensive and sophisticated equipment. Further, the procedure also requires an all-out effort on the part of the subject which may not always be desirable if indeed medically permissible. It is concluded, therefore, that the actual measurement of maximal oxygen uptake is a laboratory procedure and not practical in the general practice of physical education or medicine. However, what is not always practical to measure directly might be predicted from other data. As might be expected, there have been numerous simplified and submaximal procedures proposed for predicting maximal oxygen uptake. Two of these seem worthy of further consideration.

In 1954, Åstrand and Rhyming [8] proposed a nomogram for the prediction of maximal oxygen uptake from pulse rate data obtained during submaximal work. Since that time, their method has enjoyed wide acceptance for implementation on a treadmill, a bicycle ergometer or via bench stepping. Recent studies in our own laboratory have attested to the usefulness of the Åstrand-Rhyming prediction and its significant relationship to other indices of circulo-respiratory fitness and to the actual physical work performed.[9] Although a few may have a treadmill or bicycle ergometer available, it seems that bench stepping might be the preferred exercise medium for general physical education and general medicine.

The bench-stepping procedure [10] for the Åstrand-Rhyming prediction requires a 40 cm bench for men and a 33 cm bench for women. Stepping at the rate of 22.5 rises on to the bench per minute the exercise is performed for five or six minutes to be assured of a steady state. Pulse rates are taken at the end of each minute and the average of the last two minutes is calculated. Applying the pulse rate and the subject's body weight to the nomogram, one reads directly the predicted maximal oxygen uptake.

ASTRAND'S NOMOGRAM FOR PREDICTION OF MAXIMAL OXYGEN UPTAKE

Although a relatively simple procedure the use of the Åstrand-Rhyming nomogram for prediction of maximal oxygen uptake has one serious drawback: It is impractical, if not impossible, to test large numbers of subjects as may be desirable in physical education. Thus, the recent proposal of a 12-minute field test by Cooper in his book *Aerobics*[11] seems to merit detailed consideration. Originally using 115 U.S. Air Force male officers, Cooper found a correlation of 0.897 between the distance they could run-walk in 12 minutes and their oxygen consumption.[12] Thus, he concluded that the 12-minute test provided a good estimate of maximal oxygen consumption assuming the subjects are well-motivated.[12]

Cooper's 12-minute test has much to recommend it: It uses a well-known exercise, is adaptable for large group testing, requires little if any training to administer, and requires only a measured track, a stop watch and a whistle as necessary equipment. More important, however, is the fact that the entire Aerobic concept as advanced by Cooper is based upon the maximal oxygen uptake as an index of fitness. Not only does Cooper provide a simple and effective test based upon sound scientific principles, but he, also, for the first time, advances a pharmacopeia of exercise so that dosage can be regulated. Professionals in the fields of physical education and medicine should not be misled by the popular appeal of the book *Aerobics* as Cooper's credentials are impeccable. It appears that the 12-minute run-walk test may become a standard procedure to evaluate the type of physical fitness that is most important: the ability to take in and use oxygen.

Conclusion

Although physical fitness is one of our greatest human resources, its practical measurement presents a complex problem. In that there is no one universally accepted definition of physical fitness, there can be no one universally accepted test for measuring it. One must conclude, therefore, that each evaluator must identify the components of fitness that seem most important in his frame of reference and then select appropriate tests. There is, however, one component that seems basic to all human activity and perhaps to longevity as well: the ability to take in and use oxygen. Perhaps all fitness testing should start with the evaluation of maximal oxygen uptake by one of the several methods that have been proposed.

Total	2600 C to 5000 C	

Weight control is a problem of substantial importance to all athletes and their coaches. In certain sports, such as wrestling, the attainment of a low weight can represent a disproportionate advantage. I hope to demonstrate that the proper weight loss or gain, to reach an optimum (rather than the minimum or maximum) is beneficial to the athlete in any sport including wrestling and football.

Weight Control in Athletics

HERMAN C. MAGANZINI, MD, FACP
Team Physician
Richard Montgomery High School
Rockville, Maryland

It has been shown experimentally that obese individuals expend more energy for each unit of work performed, when compared to normal controls. There is also an increase in the "relative intensity" of energy expenditure for moderate work, ie, the blood pressure, heart rate, pulmonary ventilation, and alveolar-arteriolar FO_2 difference is increased in these individuals per unit of work.[1] In addition, it has been shown that obese individuals adapt poorly to heat and may not acclimatize at all under those same conditions of fluid and salt intake, plus exercise in the heat, which would produce this in those of normal weight.

In essence, the athlete best able to perform his given task in any sport, would be one of the proper weight and muscular development for his height and body build, given of course the necessary conditioning, coordination and skills.

Body Composition

When we speak of body weight we ordinarily give little consideration to what this represents in detail. The "scale weight" is really a composite of all those parts of the body which contribute to the body mass, namely fat, muscle, water, bone and other tissues. The weight of bone and other fixed tissue cannot readily be changed and, therefore, are not pertinent to the present discussion. The various proportions of fat, muscle, and water in an individual *can* be modified and are important to his functional capacity.

Body Water

In males 65% of the body weight is water. The specific percentage depends on the lean body mass, for adipose tissue (fat) contains only 20% water, while muscle contains 75% water. Obviously the more muscular individual would have a greater proportion of body water when compared to the fat one. Most of this water is inside of the body cells (intracellular) and under most considerations remains relatively stable at approximately 41% of the body weight. Of the other 24% (extra-cellular fluid), 4% is in the plasma (the liquid part of the blood), 15% is in the interstitial space (those minute crevices between cells and tissue planes), and 5% in the other areas (bone, water, eye fluid, etc.). Under ordinary circumstances water balance is maintained by the intake of approximately 1200 cc as the liquid part of food, 300 cc produced by the metabolism of this food to carbon dioxide and water, and 1000 cc in the form of actual liquid drinks. Of this ingested amount, approximately 1500 cc is excreted as urine, with 150 cc in the

stool, while 350 cc is lost in the expired air, and 500 cc by "insensible perspiration". This is not actual *sweat* as we usually appreciate it but minute quantities lost constantly from the skin and not really felt by us. This is a total output balancing the intake of approximately 2500 cc. Most increases in intake are balanced by automatic physiologic mechanisms which increase the output of urine. Marked increases in water loss, such as visible sweat, can only be balanced by voluntary increases in the intake of fluid and salt.[2]

Fat (Adipose Tissue)

Calories ingested in excess of daily needs are stored as fat. Those calories greater than the energy expended in heat production or in work are so stored. The caloric value of human adipose tissue (fat) has been calculated at approximately 3500 calories per pound, ie, one pound of fat will yield 3500 calories when metabolized.[3] This means that in order to lose one pound of fat, sufficient energy must be expended to utilize 3500 calories more than consumed as food or drink during the same time interval. Likewise, in order to gain one pound of fat an individual must consume food with a caloric value of 3500 calories greater than that used.

Muscle

Muscle is that tissue which actually performs the work of exercise and of productive work. All athletic training is aimed towards developing many or specific groups of muscle peculiar to the sport in question. This is in addition of course to the general cardiovascular adaptations of conditioning which are essential and common to well trained athletes in any sport.

Weight Change

Increase or decrease in weight can be reasonably accomplished only by manipulating the variables of water and fat *primarily*, and less so that of muscle mass. Loss of muscle weight occurs only in malnutrition or in the changes which occur when the highly developed muscular individual becomes less well developed and untrained as he stops continuous exercise or work. Even then the total body weight may not necessarily decrease but frequently remains stable as the ratio of fat to muscle changes. Some part of the weight which previously had been muscle is now fat. Well trained and muscular athletes especially in certain sports such as football and the shot-putter in track, etc. tend to have large well developed muscle masses. We are all aware however of the 225 pound, 6 foot 2 inch college lineman who grows to a 225 pound flabby, desk worker some years later. What happened to him? His height and weight are the same but now the muscle mass previously developed by constant exercise and work is gone. This muscle weight loss has been masked however by a weight gain of fat. His non-playing ideal weight as compared to his ideal weight while muscularly active is probably closer to 200 pounds or less.

Gaining weight by building muscle on the other hand requires continuous exercise and work to develop those muscles in question. This is accomplished by weight lifting, running, etc. but even then there is frequently little weight gain but rather a replacement of the lost weight of fat by increasing muscle mass.

The other two variables of total body weight namely water and fat, are much more easily manipulated.

Water

Except following dehydration or certain abnormal physiological states, one does not ordinarily gain weight by an excessive ingestion of fluids. The normal compensatory mechanisms quickly cause excretion of the excessive amounts of fluid to restore equilibrium.

Inadequate intake of fluid however, especially if coupled with excessive loss of both water and salt (as can occur in August, September, and later in Maryland) can result in substantial weight loss. This is not however the type of weight loss which is beneficial to the player or coach and can certainly be detrimental and even dangerous to the point of death. Dehydration, that is the excessive loss of body water, can cause (in addition to weight loss) a decrease in plasma water with a decrease in blood volume followed by decreasing flow to the body tissues and therefore a decreased delivery of oxygen. In addition there is a decrease in the blood flow through the kidneys with decreased ability to excrete acids. Both of the latter cause an increase of acid accumulation within the body or the condition *acidosis*. The body temperature and heart rate rise, the output of the heart (cardiac output) falls and there is exhaustion and collapse.

In a hot and humid environment the loss of salt and water can cause heat cramps, heat exhaustion and finally if persistent and severe, heat stroke and death. The measuring of weight loss on a daily basis can be a valuable clue to the coach or trainer, especially in the early practices and games of the late summer and fall. Rapid fluctuations of more than one to two pounds are always due to changes in fluid balance. All candidates should be weighed before and after each practice session. Any boy losing more than five pounds, which amounts to approximately ten quarts of body fluid, must be carefully watched. Any individual approaching a ten pound weight loss (20 qt of fluid) must be especially watched, controlled, instructed and very severely

restricted if necessary. This is an individual bordering on the dangerous fluid losses preceding heat stroke. Free access to water or preferably dilute salt solution on the field during all practices and games must be assured, and a priming dose should be encouraged during the suiting up period. Salt tablets and salt solutions should be encouraged and provided. The other precautions of temperature, humidity and unlform previously outlined should be followed.[4]

The changes in weight due to water loss are primarily important in order to avoid dehydration, heat exhaustion and possibly heat stroke.

Fat

Here, really, is the weight controlling variable of which we are all really thinking when this subject is being considered. The previous points were made primarily to keep one reminded that putting a boy on the scale does not necessarily measure only fat tissue loss or gain but also the other variables. As mentioned previously, this fat tissue is deposited whenever caloric intake exceeds utilization. Energy is needed by the body first for what is called *basal metabolism*. These are the basic needs of life namely to maintain body temperature, to maintain the autonomic (automatic) functions of the body such as the heartbeat, respirations, gut function, etc. and then the synthetic tissue reaction such as forming proteins and the other chemical reactions of the body. One requires energy also to perform the daily activities which are not really productive work but still essential, such as feeding and clothing. The last portion of energy expenditure is that which is essential in performing one's daily work whatever it may be.

The basic metabolic functions consume about 1500 calories daily (500 while asleep and 1000 while awake) while the daily necessary activities require approximately another 500. These 2000 calories are needed to perform *non-labor activities*. *Work activities* may vary from 600 calories for a really sedentary individual to as high as 3000 calories (approximately) for a really active athlete.

The caloric value of food consumed varies with its composition. Carbohydrate develops four calories per gram as does protein whereas each gram of fat consumed produces more than twice as much—nine calories per gram. Ethanol (alcohol) delivers approximately seven calories per gram. It is extremely easy with the usual adolescent diet to exceed the 2500 calorie requirement for sedentary and even the 3500 to 4000 calories of the athlete. It only takes a few milkshakes, french fries, hamburgers, chocolate bars plus the usual feedings to accomplish this and therefore gain weight. It is obviously more difficult to lose one pound of *fat weight* which requires the utilization of 3500 calories in excess of intake. This implies that the decreased intake of calories is essential in any program of true fat tissue loss almost in spite of the exercise program involved.

Adjuncts

Diet Pills: Although these may be helpful in decreasing appetite under ordinary circumstances they are contraindicated in the actively training individual, especially during the heat acclimatization period of the fall. The secondary cardiovascular side effects and the reported deaths while taking these stimulant drugs in hot and humid weather make it essential that they not be used.

Special Foods: In spite of the obvious food fadism especially among some of our professional athletes there is, at the present time, no demonstrable, experimental proof that honey, wheat germ, rose hips, kelp, corn oil, etc. are helpful in increasing performance or stamina. I have never felt it essential however to insist that the athletes discontinue the use of these especially if the individual is convinced of their value. Conversely, coaches, trainers, and physicians should not encourage these supplements since they certainly are not helpful and perhaps place wrong emphasis on their value versus training. Some of these foods in addition, cause gastrointestinal upset and it would seem foolish to risk nausea, vomiting or indigestion prior to an athletic contest in order to gain a minimal psychologic and a nonexistent physiologic effect.

Vitamins: No vitamins have been shown helpful including injections of Vitamin B-12, high potency B vitamins, Vitamin E, etc., etc., etc. in spite of what is written in the lay press and in spite of what some trainers and even the physicians of some teams seem to encourage.

Salt: It is essential to have salt supplied in large quantities along with adequate fluid in the training and acclimatization periods. Once again this is not one of the things that can be done on the day of a game. The salt and fluid stores of the body have to be built up over the ten days to two weeks which are necessary for heat acclimatization in order to be valuable. It is not worth risking nausea and vomiting in pushing salt pills on an individual the day of the game. The athlete must be encouraged to take the salt as tablets and in liberal quantities on food during the training period. Much more essential is the provision of adequate fluid in liberal and unrestricted quantities on the field for the game, perhaps in the form of palatable salt solution but even as water.

Pre-game Meals: Depending on the state of excitement and the type of food (such as fat versus carbohydrate versus protein) it will take two to six hours or longer for the stomach to empty following

a meal. The only advantage of a liquid meal might be if it were more easily digested and tolerated, without nausea or vomiting. Regardless of the long history of traditional meals prior to a game that many teams use, physiologically nothing ingested on the morning of the game (or between halves of the football game) will have any effect on performance. A proper diet during the previous days and weeks building up glycogen stores, etc. is much more important to adequate performance on the day of the game.

Ideal Weight: The ideal weight for any individual varies depending on height, body stature and muscular development. It varies somewhat from sport to sport. Comparing a long distance runner with a football interior lineman as to adequate and ideal weight, using the same standards, would obviously be unreasonable for their muscular development is entirely different. We are considering muscle weight and not a *flabby fat boy*. There are many tables available, some of them quite elaborate including hip measurements, chest measurements, etc. but simple height and weight tables usually suffice. Most often a coach or trainer can look at one of his candidates and tell whether or not it is fat or muscle in the overweight suspect. There is a tendency among some football coaches to like *heft* in their line regardless of whether it is fat or muscle. I think however, most of the better coaches would agree that usually a 210 pound fat boy is going to be moved by a 190 pound muscular, agile individual of the same size.

As far as wrestlers and their coaches are concerned, we have another problem. They are interested primarily in what the lowest weight would be to allow the athlete to compete in the lightest category possible. This varies of course with stature but the various devices used in the past and even the present to make the "weigh in" are to be deplored. As is obvious from our previous discussion rapid weight losses are always due to water and salt loss. These deficits of dehydration cannot be repaired within the several hours prior to a match and still expect the athlete to perform well or even safely. Nor is it reasonable to keep a boy on a semi-starvation or dehydrating diet to help him stay within a given weight class and expect him to perform safely.

Can anything be done to avoid the weigh-in problems especially of a sport such as wrestling? Should weighing in before matches be completely abolished? A recommendation has been made that all boys out for wrestling be weighed on a surprise weigh-in twice a year, placed in a weight category and left there for the rest of the year regardless of change. Another plan would weigh the wrestler after four to six weeks of training and make that his minimum effective weight.[5] Some change may be due!

Summary

Obesity is undesirable in any athlete for it impairs his ability to perform to the maximum of his own personal, ultimate capabilities.

True (fat) weight loss can only be attained by hard physical work and decreased food intake, especially of the high caloric foods, so that the energy expended is in excess of the calories ingested at the rate of 3500 calories per pound of fat.

Special foods, such as honey, wheat germ, etc. are of no help and should not be encouraged. For an individual who is already convinced of their efficacy and using them, controversy can be avoided unless they are shown to cause him gastrointestinal upset or other detriment.

No diet pills, Vitamin B-12, anabolic steroids, etc. are necessary or desirable. Certain of these can cause toxicity and be detrimental.

No rubber suits should be encouraged or tolerated for they do not cause true fat weight loss but only fluid loss and have been implicated in precipitating heat stroke.

Rapid weight fluctuations of any magnitude are due to fluid shifts and do not represent *fat* weight loss or gain and therefore are not of themselves desirable. Chronic or acute dehydration can be extremely dangerous to the athlete, especially so in hot, humid weather.

I hope that all of the coaches, trainers, physicians and educators present will give serious consideration to the problems of weight in our athletes. Although obesity is undesirable, the opposite viz. artificially induced and excessive weight loss by dehydration and semistarvation is to be condemned. We must all be alert to safeguarding the individual above all, even to the detriment of the team if necessary. Standards must be reviewed, modified or discarded if unsuitable. These standards must be so arranged that all teams can compete without unfair advantage, and without compromising the safety of the individual athlete.

It is interesting to note that the pamphlet published by the American Medical Association entitled, "Medical Evaluation of Candidates for School Sports" makes no mention of the cutaneous lesions that should disqualify a candidate for participation in athletic activities. It should be obvious that conditions such as, acne congoblata, furunculosis, impetigo contagiosa, monilial infections, plantar warts, swimming pool granulomas, mycotic infections, and contact dermatitis would disqualify a candidate for participation until the condition shows a satisfactory response to treatment. More adequate instruction should be given about the necessity for, and methods of, complete examination of the skin.

Skin Problems in Athletics

HARRY M. ROBINSON, JR., MD
Professor of Dermatology
University of Maryland School of Medicine

Many hazards face the person engaged in sports. The skin is readily subject to injury. Participants may develop eruptions or aggravate previously existing skin lesions.

Fungus Infections

The term "Athlete's Foot" has been applied to a variety of lesions that affect the feet. It has been assumed that these foot lesions are due to fungi, therefore various popular remedies are used in treatment by physicians and athletic instructors as well. Unfortunately, in the vast majority of instances, attempts are not made to establish the diagnosis by proper laboratory methods.

Only a very small percentage of patients with so-called Athlete's Foot, actually have fungus infections, but because of the ill-advised use of many different medications, a large number develop eczematous eruptions. Lesions commonly mistaken for fungus infections may be dyshidrosis, shoe dermatitis, psoriasis, or bacterial infections. Specific medications should never be used until the diagnosis is established. Self-medication must be discouraged.

Fungus infections of various types are common occurrences, but the degree of contagion is not quite as great as popular opinion would have us believe. They do not constitute a major problem among athletes. The person who has the fungus infection is uncomfortable and needs competent diagnostic and therapeutic care. Fortunately, specific drugs are available for the treatment of most fungus infections, but must be prescribed by a physician. (Most of the patent medicines are worthless.)

Bacterial Infections

Bacterial infections are troublesome because they are readily communicable. Pyogenic infections are relatively easy to control by antibiotic therapy, but until the lesions have completely healed, the patient should be restricted from physical contact with other persons.

The swimming pool granuloma is a chronic infection caused by an atypical acid fast bacteria. These lesions, which appear as warty growths, are most commonly found on the elbows and knees. They should be removed surgically by wide excision in order to prevent recurrence. A culture should be made from the cut surface of the excised material to rule out the possibility of tuberculous infection.

Viral Infections

The sports world should be grateful to Dr. Lester Dyke, Head of the Student Health Department of the University of Maryland at College Park. Dr. Dyke recognized the communicability of herpes simplex among wrestlers. This is a common troublesome condition for which there is no specific treatment.

Molluscum contagiosum is another relatively common virus infection of the skin, but is not readily transmissible.

Allergic contact dermatitis may develop from exposure to grass, rosin, soap, perfume, body lotions, liniments, etc Practically all substances have some sensitizing potential.

Plantar corns and warts are painful lesions for which there is no specific treatment. Surgical procedures are to be avoided. The plantar wart is caused by a virus, whereas, the corn is due to local irritation. Only an experienced physician can differentiate between the two. Although warts are thought to be non-contagious, they are infectious and there is little doubt that they occur most frequently in dormitories where community baths are used. These plantar lesions should never be treated by an untrained layman, and further local irritation with patent medicines must be avoided. Irritation and extension of the lesion may be caused by prolonged use of rubber shoes. Although radiation therapy has been advocated, it is only successful in a small number of patients and, unless given by an expert, may produce great damage.

Bacterial infections may complicate traumatic blisters contact dematitis, eczema, fungus infections, and dyshidrosis. If not treated promptly and properly, severe damage may ensue. Fortunately, specific antibiotic therapy is almost invariably successful in eradicating such infections.

Allergic contact dematitis may develop from the materials used in shoe manufacture.

The use of foot baths in shower stalls is to be condemned because these troughs are a haven for bacteria, fungi, and filth. These baths are ineffective. It makes little sense to have 40 or 50 people walk through the same trough going to and from the shower. A much safer and more effective method of prophylaxis is the use of alcohol on the feet and between the toes immediately following the bath.

As a general rule, acne vulgaris should not be a limiting factor in sports participation. In some patients, the large cystic lesions and draining sinuses are a contraindication to participation in contact sports.

Exposure to sunlight may cause an eruption or may aggravate an existing lesion. We have come to recognize photosensitivity eruptions following drug administrations, or the topical application of remedies. Some soaps will sensitize the skin action to sunlight.

Summary

The physical examination performed on sports participants should include a careful examination of the integument. A careful record should be made of all cutaneous abnormalities, regardless of how small or insignificant. Whenever possible, corrective measures should be taken or specific therapy administered. If the lesion is such that it will be aggravated by trauma or exposure, it should be corrected or the patient should be restricted. If infections develop during the course of athletic activities, they should be corrected immediately by a competent physician. Amateur therapy is not to be condoned.

Medical Aspects of the Obese Child in Athletics

MILTON S. GROSSMAN, MD
Associate Professor of Pediatrics
University of Maryland School of Medicine

Obesity can be determined in an individual by comparing weight to height. One of the most satisfactory charts for this purpose is the one based on Stuart's data. Stuart and his group in Boston were interested in anthropometry, the classification by body type—ectomorph, mesomorph, and endomorph—according to body habitus. This is an important concept to consider. There are numerous muscles in the body and mere weight does not reflect body mass, or the proportion of body mass that is fat.

You cannot use a weight chart alone. For example, a professional football player, weighed when naked and dry, will be immensely obese according to standard health charts. But, place him in an immersion tank and then weigh him and he fits the chart. The reason for this is that fat rises and the more fat you possess the lighter you are in water. By this method, ie, weighing and individual wet vs dry, one can demonstrate how an athletic program —physical fitness—actually changes the proportion of fat to muscle which is a constructive way of evaluating obesity, and the effect of an integrated athletic program.

Measures for Obesity

The mesomorph is the muscular, powerful fellow. The endomorph is the fat, sloppy, overweight individual, and the ectomorph is the exquisitely thin-structured person.

In dealing with children and adolescents, a very much simpler method of evaluation is utilization of the chart adapted from the Stuart data. A study of healthy American children—by the thousands—would reveal that 94% of them fall within what is considered the "ideal" on the chart. Of the remaining 6%, 3% would be below the line on chart, but would still be considered normal, and 3% would be one extreme or the other—either very thin or very fat. For example, at age 12, 50% of female children studied would be taller than 58 inches, and 50% would be shorter than 58 inches. The person who falls within the 97th percentile in weight should fall within 97th percentile for height in order to be ideal. Twenty-five percent fluctuation is allowed, however.

Obesity is said to be a greater than 50% increase of weight for height. Malignant obesity—the extreme —is greater than 100% weight for height. For example, if a person should weigh 50 lb at a given age, obesity would mean that he would weigh 75 lb, and malignant obesity would have him at 100 lb.

Of course, the ratio of weight to height depends upon body habitus, body size, and hereditary aspects.

Karen Whitehouse, in 1962, studied 25,000 children of various ages in London. She used a simple technique to define obesity in this group skin caliper measurements, from the triceps region of the muscle at the inferior level of the scapula, were taken. This is the best place to measure skin folds and fat. Her studies indicated that there were striking differences in the children and body habitus, and from this data, Whitehouse's group constructed a chart that is very similar to the Stuart data chart. Boys and girls grow at a fixed rate; they accumulate fat at a fixed rate from birth through adolescence. A 12-year-old boy, for example, with a skin tricep fold of 4.5mm would be in a third percentile of the group. With a skin tricep

fold of 22mm he would be in the 97th percentile. The statistical range would be from 4.5 to 22 with a mean of 9mm for boys. Girls, on the other hand, would have a range that starts at a 4.5mm in the third percentile, but would go up to 25mm at the 97th percentile. The mean for girls would obviously be higher.

After age eight, girls accumulate fat more rapidly than boys, but from age two on boys and girls accumulate fat at the same rate.

Why is it Important to Approach the Obese Child?

If a child finishes his adolescent growth spread in an overweight condition, his chances of being slender as an adult are markedly diminished. Therefore, it behooves the physician to concentrate on weight control before the completion of growth.

Dr. Mayer, a nutritionist in Boston, and well-known lecturer on obesity, has given us a lot of statistics on obesity. In a given population of 15 year olds with one obese parent for each child, 20% of the adolescents will be obese; if both parents are obese in this population, 80% of the adolescents will be obese. We must, therefore, consider that heredity plays a definite role, and further, it is difficult to differentiate between heredity and environment. Obviously, if both parents of a child are obese, they may have acquired obesity as adults and this may reflect emotional maladjustment and many other things. Nevertheless, it is important to recognize that the body habitus of the parents bears a very strong relationship to how the child will grow.

The Defect of Obesity

Inactivity is the primary defect of obesity. The one fact that permeates this entire population is that the more obese an individual is, the more inactive he is; and the less active he is, the more obese he becomes. It is a very difficult and frustrating cycle for the physician.

An individual who is obese as an adolescent is rejected by his peer group. He is not accepted in sports, either in or out of school. This is all very distressing to the adolescent and he goes home and sits and watches television, and snacks. Most studies of obese adolescents have revealed that they eat a very poor breakfast, a very slight lunch, and then indulge in "wall-to-wall" eating from the time they come home from school until they go to bed. Most adolescents are night time eaters. It is the wall-to-wall pattern we have to break.

Obesity in the growing child is the accumulation of more fat cells, just like increasing muscle mass is the increase in protein and cell number. Obesity in the adult is the increased fat content of cells that are already present. If a person is to grow significantly, he must increase the number of cells he has, but if he does this by increasing his fat cells, the process is irreversible after growth has ceased in the rest of the body. One can go on all sorts of diets and decrease the volume of the cells—the cell size—so that he looks more compact, but the slightest slip from whatever weight control group he is involved in and he blows up again. Therefore, to protect the adolescent from a weight problem as an adult, one must prevent an excess growth of fat cells during these important years.

An adult athlete accumulates fat at an extraordinarily rapid rate once he becomes inactive, but on the other hand, it doesn't take much physical activity, although it has to be continuous, to get him back into shape, because the number of fat cells in his body are relatively few in comparison to the chronically obese non-athlete whose obesity dates back to adolescence.

The public is well aware of the health aspects of excess weight, such as, diabetes, cardiovascular disease—it should be the physician and athletic director's goal to help prevent these costly complications of modern life.

An Obese Child in Athletics

Physicians are called upon to screen children for athletic programs. Somehow the physician is supposed to tell athletic directors whether or not a child is healthy; he is supposed to separate an obese child from ideal children and recommend that he not participate in sports, even if his obesity is not clinically significant, for fear that if he were to participate, he might do harm to himself. Unfortunately, our physician group, with few exceptions, has not been adequately interested in this particular aspect of medicine. One cause of this inertia may be that we have physicians who are responsible for athletes and athletic teams who have never been athletes themselves. Consequently, they do not understand the dynamics of what athletic directors are trying to do anymore than athletic directors understand what the physicians are trying to do. There is a definite lack of communication—the goals are different. It should be the objective of both the athletic director and physician to involve the obese child in athletic activities as much as possible.

In my own practice, child after child comes to my office for obesity and weight control with a slip from his physician to the physical education teacher stating that the child should not participate. This, without a doubt, is the worst thing in the world that could happen to a child in the majority of cases. It needs to be pointed out that it is vitally important for the physician to distinguish between the child with endocrine obesity, ie, some glandular disturbance which is exceedingly rare, and the child with exogenous obesity—he just eats too much. The distinction is really very simple. A child who is growing well is a child who is tall, and fat, normal children are taller than their peer group. All medical causes of obesity cause growth to fail.

On the other hand, a normal, fat child may have high blood pressure and if this is the case, it could be risky if he were to participate in vigorous sports. Most high blood pressure, however, is just an artefact of inadequate equipment and improper observation.

One of my former colleagues, Warren R. Guild, MD, of Boston, has written a delightful book entitled "How to Stay Fit and Enjoy it." It was published by Harper & Row in 1962. The book covers the dynamics of physical fitness, obesity, nutrition, and a variety of other subjects.

What we know about the medical aspects of obesity in athletics came from the so-called Pheidippidian physiology. Pheidippides was a great Greek runner who set the pace for all subsequent marathons. (He was not, however, the courier who ran from the Battle of Marathon to Athens and whose first words on arriving were, "Rejoice, we have won!" and then he dropped dead.) Pheidippides enjoyed running and knew how to conserve his strength. He introduced the concept of the correlation between nutrition, training, stamina, and physical development. There is an excellent article in the *New England Journal of Medicine*, December 12, 1967, entitled "Echoes of Marathon" which I urge you to read. It is from a symposium of marathon people and physicians and is one of the best articles ever to come out on the medical aspects of sports.

One of the most important roles of an athletic director is to prevent inactivity and encourage massive activity. There is no question that the obese individual can, with training, withstand the same rigors of sports as any other individual. In discussing the problem with some coaches in Boston, the conclusions we came to included the necessity of having a good physician to screen the adolescents. This has to be a physician who is interested in, and who understands athletics, and is willing to work with overweight adolescents. The coaches said they have been amazed that even in basketball the overweight child, who really is motivated, in an integrated program can develop fantastic speed. Four things that are important include motivation, integration, skill—in the sense that they should have some coordination—and a consistent well-integrated, well-constructed training program.

From a Medical Point of View

The obese individual has a very high level of fatty acids in the blood. This is how we can medically tell the obese individual without even looking at him. Other clinical situations in which fatty acids are elevated in the blood include pregnancy, starvation, menstruation, and acromegaly—the excess of a growth hormone.

We know that the level of fatty acids in the blood is a balance between the effect of growth hormone and insulin. We know that if the fatty acids are elevated, a child can have a diabetic-type glucose tolerance curve. The higher the fatty acids are elevated, the insulin sensitivity, that is the ability of tissues to respond to insulin, decreases. In other words, the longer one preserves fat, the less sensitive the cells are to the immobilization effects of insulin.

Both starvation and obesity result in a high level of fatty acids. In a sense, another way of describing this is that such evidence suggests that both of the conditions are profound metabolic derangements. In summarizing all of our research on this, we have found that, with physical fitness programs, we can lower fatty acids very strikingly. We have also found that if we take fatty acid levels on a healthy adolescent population at the beginning of a season, and then take them after they are "physically fit" they will have been lowered.

Summary

We now have been able to show, after much research and work, that there are medical correlations with metabolism of food stuffs and the excess accumulation of fat. With diet plus exercise, with this creation of activity, one can change the metabolism. The diet most successful in creating this change is a very high protein diet. The high protein diet we use is 30% protein in contrast to the normal American diet of 15% protein, 25% carbohydrates, and the rest comprised of unsaturated fatty acid.

My own studies suggest that within the next 10 to 15 years, the American diet will be very high in protein. The high protein diet has many advantages —it is filling; so that one can eat a lot less, and, therefore, consume fewer calories per unit. An obese child is fed five or six times a day. This is how children normally eat. Coupled with exercise the child enjoys, and this is the key to physical fitness, the child will willingly participate and the rest will really be on his own doing.

A high protein diet seems to produce (we aren't positive yet) better physically fit individuals. However, four hours before this individual is to participate in a strenuous athletic event, he should be given a high carbohydrate meal. The reason is that protein has to be burned as a metabolic acid and has to be excreted through the kidneys, and the kidneys work very poorly during vigorous athletic sports. One needs instead, a high carbohydrate feed prior to, and subsequent with, the rigorous activity.

In essence, what I have said is that an obese child needs to be encouraged to participate in athletic activities, and needs to be observed by a physician who is willing to supervise the child's diet and exercise. In effect, the child needs to be told that there is no physical disability connected with his obesity and that, with a little bit of participation on his side, he need not be obese.

your medical faculty at work

by John Sargeant
Executive Secretary

The Executive Committee met on Thursday, June 5, 1969, and took the following action:

1. Authorized expenditure up to $350 for co-sponsorship with the Communicable Disease Center, USPHS, of a symposium on Viral Diseases in November 1969.
2. Agreed to present AMAERF checks at the Presidential dinner rather than at House of Delegates sessions at future annual meetings. This is being done at the request of the Woman's Auxiliary which is instrumental in raising funds for the presentation of these checks.
3. Authorized the Program and Arrangements Committee to make suitable arrangements for a tour of the Orient in May 1970.
4. Heard that the President, President-elect, Council Chairman and Executive Secretary attended a conference sponsored by the Governor on Wednesday, June 11, including dinner at the Governor's mansion and an all-day session on Thursday aboard the Governor's yacht.
5. Heard the results of a meeting with the Governor and Secretary of Health on May 27, when the President, President-elect, Council Chairman, and Executive Secretary discussed mutual problems in the health fields.
6. Heard that John C. Krantz will act as the Faculty representative at the 1970 U.S. Pharmacopeial Convention in Washington, D.C.
7. Approved proposed new laboratory licensure regulations with amendments, as suggested by the Maryland Society of Pathologists.
8. Heard and adopted a report of the Ad Hoc Committee on Consent Forms and agreed to notify chiefs of staff of all hospitals that copies of the suggested forms are available on request.
9. Agreed to continue financial support to a member's wife and family while he is hospitalized, with the understanding that the case will be reviewed again in six months time.
10. Agreed to consult with the Secretary of Health in connection with a proposal that the Commission on Medical Discipline law be changed so that the Faculty would submit the names of 24 individuals from which appointments to this Commission would be made.
11. Agreed to invite Ray Holden, MD, Washington, D.C., a member of AMA Board of Trustees, to a future Council meeting to discuss AMA policies.
12. Heard that William J. McClafferty, MD, Baltimore, has been named by the Workmen's Compensation Commission Chairman to serve on the Continuing Committee to Study the Workmen's Compensation Medical and Surgical Fees.
13. Authorized advising the State Health Commissioner that the Faculty is willing and anxious to assist in discussing Rx practices of physicians, but needs adequate information with names and data before it can pursue such investigations.
14. Agreed to look into the question that has been raised that Blue Shield is interfering in connection with patient charges when a physician is not a participating physician with Blue Shield.
15. Met with a counterpart group from the Maryland State Dental Association to discuss mutual problems.

The Executive Committee met on Thursday, June 19, 1969, and took the following action:

1. Reaffirmed the position that the brochure published by the Faculty dealing with the Commission on Medical Discipline was directed to physicians and to members only. No attempt is being made to regulate lay laboratories or to determine what is ethical or unethical for such groups.
2. Authorized legal counsel to direct a letter to attorneys who query Faculty action in this regard.
3. Established a date of July 24, 1969, for the next meeting of the Executive Committee to handle any business that has accumulated by that date.

The Council met on Thursday, June 19, 1969, and took the following action:

1. Adopted minutes of previous meetings of the Council and Executive Committee.
2. Declined to provide "expert witnesses" to the U.S. Department of Justice, Bureau of Narcotics and Dangerous Drugs, to assist the government in prosecution of criminal cases involving persons in the medical profession on the grounds that no provision is contained in the Faculty Bylaws for such action, and on the advice of legal counsel.
3. Adopted a policy statement on Sex Education and Family Life Planning which reads as follows:

   The Medical and Chirurgical Faculty of the State of Maryland recognizes that the primary responsibility for sex education will always remain within the home, but the school, church, and some other community agencies have a supplementary role in reinforcing and supporting the efforts of the home.

   The Faculty supports the inauguration and implementation within the school system of a family life and sex education program which will fill the following criteria:

   1. That it be part of an over-all health education and biology program;
   2. That it be presented in a manner commensurate with the maturity and emotional level of the students;
   3. That the sex education course follow a professionally developed and regulated curriculum;
   4. That the sex education program attempt the medical societies (both state and city) be community in the classroom teaching situation;
   5. That the sex education program utilize classroom teachers and other professionals and sub-professionals who have shown an aptitude for working with young people and who have received special training;
   6. That the sex education program have as consultants, advisors and resource persons: physicians, nurses and public health personnel to be responsible for the *development* and guidance of such a curriculum, and that the medical oscieties (both state and city) be encouraged to take an active part.

4. Agreed to publicize the above statement through "all Communications Media."
5. Endorsed, in principle, a proposal for a pre-school hearing and vision screening survey program, and authorized the Treasurer and Executive Committee to approve expenditure of the necessary funds to implement this.
6. Authorized employment of a press consultant for the 1969 Semiannual meeting; and for inclusion of funds for such employment for the 1970 Annual and Semiannual sessions in the 1970 budget and thereafter.
7. Accepted with regret the resignation of Louis A. M. Krause, MD, from the Library and History Committee; and named Paul F. Guerin, MD, to serve in his place until the 1970 Annual Meeting.
8. Adopted an expression of appreciation to Vernon H. Norwood, MD, for his many years of service on the Board of Medical Examiners.
9. Approved recommending to the House of Delegates Emeritus membership for various members, on the recommendation of the Baltimore City Medical Society.
10. Agreed to recommend a standing rule to the House of Delegates dealing with reports by other than Committee Chairman, Officers, etc., which would limit such verbal reports to five minutes with the understanding that the full report could be printed in the transactions of such sessions.
11. Declined to approve a proposed Glaucoma Screening Project in the form presented, and because support of the organization involved in providing the screening population had not been obtained.
12. Accepted a report from the Ad Hoc Committee on Tuberculosis and discharged it with thanks.
13. Received financial operating and dedicated fund statements through March 31, 1969.
14. Heard of receipt of an additional sum of money to be added to the Laughlin Award Fund, which now totals $2,906.83.
15. Asked for suggestions for consideration by the AMA Board of Trustees for possible appointment to various AMA Councils and Committees.

16. Adopted the following policy statement in connection with Drug Abuse Treatment Centers:

That the Medical and Chirurgical Faculty of Maryland endorses the concept that selected hospitals be encouraged to establish drug abuse treatment centers under their auspices, either as part of, or at some reasonable proximity to, its hospital facilities, under strict professional and administrative controls, and using accepted methods of treatment and ancillary personnel, such as medical social workers, psychologists, nutritionists, etc., as well as psychiatrists, internists, pediatricians, etc.

It is understood that such selected hospitals must have adequate staffing, resources, financing, space and other facilities, and that they would conform with the Ethical Guidelines for the Treatment of Narcotic Addicts, as adopted by the Medical and Chirurgical Faculty.

17. Adopted the folowing statement in connection with Multiphasic Screening Programs:

The Ad Hoc Committee to Discuss Multiphasic Screening Programs concurs with the feasibility report submitted by the Bendix Corporation and recommends its acceptance. It further believes that this concept is worthwhile, even though still in its infant stage, and that lines of communication should be kept open with the Bendix Corporation or other groups so that implementation could take place in the event changes occur in our social and environmental setting.

The Committee also recommends that the Faculty go on record as being interested in instituting such a program under Faculty sponsorship, in the event it does become feasible. The Committee recommends that this subject should be reconsidered at regular 6 month periods.

18. Authorized the Bylaws Committee to study the question of dentists serving on various Faculty committees.

rehabilitation notes

Rehabilitation of Patients Suffering from Fracture of the Hip*

Part II: Treatment by Hip Pinning

JOHN D. HSU, MD
Division Orthopaedic Surgery
Department of Surgery
Baltimore City Hospitals
Johns Hopkins Medical Institutions

Rehabilitation of patients following the operative treatment of fracture of the hip by hip pinning is an essential part of the over-all management.

In the specific orthopaedic treatment of fracture of the hip, the introduction of open reduction and internal fixation by Smith-Petersen,[1] together with the development of suitable metals for internal implantation [2] has revolutionized the treatment. The unfortunate past experiences and poor prognoses described in earlier textbooks in the treatment of such fractures,[3, 4] and the descriptions of the tremendous discomfort and agony suffered by such patients are rarely seen now.[5] Smith-Petersen's idea was developed mainly for intracapsular fractures. His method was open reduction of the fracture, followed by introduction of the nail for fixation. Today, the preferred method of surgical management is extra-articular hip nailing, after closed reduction of the fracture under radiographic control. This method can be used for many types of hip fractures.

The patients under consideration suffered acute hip fractures and recovered without major complications. Such cases comprise the majority of instances for which hip nailings are done. The study does not include patients who were unable to walk prior to the operative procedure or patients with metastatic or other terminal illnesses.

* *Supported in part by an American Geriatrics Society Award and USPHS Grant No 5T1 GM00624-08.*

Evaluation and Postoperative Regimen

Since every patient with fracture of the hip is a potential operative candidate, initial assessment should include the procurement of information helpful for postoperative planning. Rehabilitation should be considered as early as possible so that planning can be done at the earliest moment.

The physical evaluation of the patient and the administration of the MSCL and ADL tests are usually made at a time when the patient's condition has stabilized and improved to an extent where sufficient information can be obtained for planning.[6, 7] Physiologically, the earliest time possible during the convalescent period that the patient can give a meaningful answer is when tissue catabolism has stopped and recovery has started. This has been called the "Turning Point Phase."[8] At this time, the patient has started to show an interest in other people and his surroundings. He can concentrate and become cooperative with the tester. It often takes three or four days to a week before the patient becomes completely interested and is capable of performing a "test" to determine his mental status and physical ability. In older patients, more time for recovery should be allowed.[9]

As the delay for this optimum period is usually not great, and it does not interfere with the treatment and prolongation of hospitalization, the treating physician has a chance to assess the problem at hand, together with others that may become manifest during the postoperative period.

In consideration of rehabilitation, patients with fracture of the hip treated by hip pinning should be divided into three age groups in relation to the special problems encountered. Such a classification is also of value for making a prognostic prediction, but individual considerations are important.

I The young age group (up to age 54)

II The intermediate age group (55-64 years)

III The older patient (over age 65)

Results

Studies were made at the Baltimore City Hospitals, between 1963-1968, of patients suffering from fracture of the hip. In cases that met our previously stated criteria, the MSCL, ADL tests were administered, in addition to a general clinical evaluation in the Department of Physical Therapy and Rehabilitation, prior to the institution of a rehabilitation program for each individual patient. It was found that patients in Group I and Group II, treated by hip pinning, showed a distribution of MSCL scores on initial testing to be higher than 36 (out of a maximum score of 50) with a mean at about 40. The mean ADL score was approximately 50 out of a maximum of 100. This score was reasonable because the patients were unable to perform the walking activities in the early postoperative period. In Group III, the older patient, the mean ADL score was about 35 and the mean MSCL score between 25 to 30; both figures are appreciably lower than in the younger age groups.

At the time of conclusion of the active rehabilitation program and discharge from the Physical Therapy Department, 88% of Group I patients showed an ADL score of between 80 to 100, and 97% of the patients were independent on crutches. Active rehabilitation measures were discontinued as these patients gained the maximum benefit and progressed well independently. This improvement was seen in a period of less than one month. Of 77% Group II patients, on final testing scored between 80 to 100 on the ADL test, with much improvement also seen in less than one month; 70% were ambulating on crutches; 25% needed the assistance of a walker. Most patients continued some form of contact with the Physical Therapy Department from receiving simple guidance and reassurance to transfer and gait training activities, after one month time had elapsed from the time of the initial test, in addition to their scheduled regular orthopaedic clinic visits.

Group III patients showed improvement over a much longer span of time. At the time of discharge from hospital, over 40% remained dependent on a walker, while the more elderly were dependent on a wheelchair or bed and needed continued active care and rehabilitation.

Thus, the age difference is most important in discharge planning, as well as in selecting the aids necessary for maximal benefit. The initial postoperative examination, and evaluation with the MSCL and ADL are also helpful. A regimen planned with the help of these measurements is useful in the rehabilitation of patients with fracture of the hip, treated by hip pinning.

WILLIAM J. PEEPLES, MD, MPH, COMMISSIONER

Maryland State department of health

Highlights

The Board of Health and Mental Hygiene, which held its last meeting on Friday, June 13, traces its origin to nearly a century ago, when the first Board of Health was appointed in 1874 by Governor Groome. A joint Board, under its present title, was established in 1961 to fulfill the combined responsibilities of the Board of Health, the Mental Hygiene Advisory Board, and the Mental Hygiene Board of Review to act as the policy-making agency for the Departments of Health and Mental Hygiene.

In the years following, a succession of dedicated men and women have served on the Board and have given generously of their time and professional talents on behalf of public health in Maryland. The Health Department is grateful to the eleven members serving on the Board who have carried on the distinguished tradition of their predecessors, and we hope that Maryland will continue to benefit from their expertise in some phase of public health.

I wish to express my personal appreciation to all of those who have served on the Board during my tenure.

I look forward with great expectation to the accomplishments in the health field which can occur under the new organizational structure of the executive branch of government in Maryland. As of July 1, the Departments of Health and Mental Hygiene are combined with other health-related agencies and boards in a single department under the direction of Neil Solomon, MD, PhD, Secretary of the Department of Health and Mental Hygiene.

THE BEST CARE AVAILABLE
UNDER CONSTANT MEDICAL SUPERVISION
MODERATE RATES

Dear Doctor, You made me what I am today— a whole lot slimmer!

TEPANIL—the right start in support of th weight-control program *you* recommend. reduces the appetite. Doesn't kill it. Weig loss is significant—gradual—yet there is relatively low incidence of CNS stimul tion. Because TEPANIL works on th appetite, not on the "nerves."

Contraindications: Concurrently with MAO inhibitors, in patie hypersensitive to this drug; in emotionally unstable patie susceptible to drug abuse.

Warning: Although generally safer than the amphetamin use with great caution in patients with severe hypertension severe cardiovascular disease. Do not use during first trimester pregnancy unless potential benefits outweigh potential risks.

Adverse Reactions: Rarely severe enough to require discontinuation of th apy, unpleasant symptoms with diethylpropion hydrochloride have been report to occur in relatively low incidence.

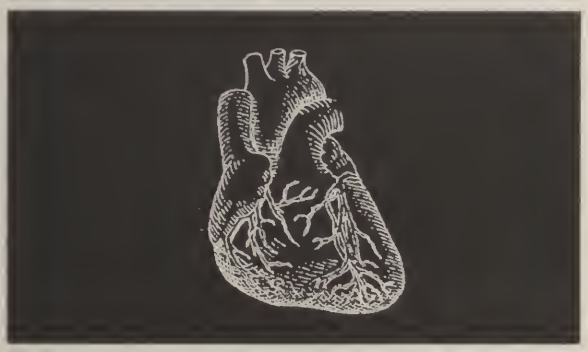
As is characteristic of sympathomimetic agents, it may occasionally cause CNS effects such insomnia, nervousness, dizziness, anxiety, and jitteriness. In contrast, CNS depression has be reported. In a few epileptics an increase in convulsive episodes has been reported.

Sympathomimetic *cardiovascular effects* reparted include ones such as tachycardia, precord pain, arrhythmia, palpitation, and increased blood pressure. One published report describ T-wave changes in the ECG of a healthy young male after ingestion of diethylpropion hyd chloride; this was an isolated experience, which has not been reported by others.

Allergic phenomena reported include such conditions as rash, urticaria, ecchymasis, and erythem *Gastrointestinal effects* such as diarrhea, constipatian, nausea, vamiting, and abdominal disco fort have been reported.

Specific reports on the hematopoietic system include two each of bone marrow depressio agranulocytosis, and leukopenia.

A variety af miscellaneous adverse reactions have been reported by physicians. These inclu complaints such as dry mouth, headache, dyspnea, menstrual upset, hair loss, muscle pa decreased libido, dysuria, and polyuria.



Convenience of two dosage forms: TEPANIL Ten-tab tablets: One 75 mg. tablet daily, swallow whole, In midmorning (10 a.m.); TEPANIL: One 25 mg. tablet three times daily, ane hour befo meals. If desired, an additional tablet may be given in midevening to overcome night hung Use in children under 12 years of age is not recommended.

Tepanil® Ten-tab®

(continuous release form)

(diethylpropion hydrochloride)

Arrhythmias in Myocardial Infarction

Arrhythmias associated with myocardial infarction in man have been reported in the literature for more than 40 years. These reports were based on information supplied by occasional electrocardiograms. With the advent of coronary care units in 1962, and the continuous electrocardiographic monitoring of patients with acute myocardial infarction, a new era began. More has been learned about myocardial infarction and its attendant arrhythmias in the last few years than in the more than 50 years since James Herrick published his classical account of the "Clinical Features of Sudden Obstruction of the Coronary Arteries."[1] Masters et al,[2] in 1937, reported an average incidence of arrhythmias of 17%. Today, however, a much higher incidence of arrhythmias in myocardial infarction is recognized. Some have estimated that approximately 50% of patients with acute myocardial infarction die before reaching the hospital. Therefore, data obtained from patients reaching the hospital are still highly selective with statistical bias, introduced by the elimination of deaths occurring prior to hospitalization.

The recent introduction of the mobile coronary care unit by Pantridge in Belfast, Ireland, and its use now in some areas in the United States, is expected to add even more information regarding both the incidence and type of arrhythmias encountered after acute myocardial infarction. Pantridge and Geddes [3] have estimated that ventricular fibrillation is 15 times more likely to occur during the first four hours after a heart attack than in the following eight hours.

CHRIS PAPADOPOULOS, MD
Chief of Cardiology and
Director, Coronary Care Unit
South Baltimore General Hospital

Almost any arrhythmia may occur in myocardial infarction. The early recognition and prompt treatment of these arrhythmias is extremely important since they are responsible for more fatalities in myocardial infarction than any other complication. Disturbances of conduction and failure of impulse transmission may occur within the sinus node, atria, AV junctional region, bundle of His, or Purkinje system. This may be due to exit block at the site of impulse formation or due to a retrograde or competing impulse interfering with normal impulse transmission. Disturbances of normal impulse formation may result in take over by other pacemakers within the AV node, bundle of His, or bundle branches.

Some form of arrhythmia occurs in approximately 80% of all patients suffering from acute myocardial infarction. There are some differences in the total and individual incidence of arrhythmias reported from various coronary care units, but this may be due to the method of monitoring, the length of observation, and the criteria for diagnosis of myocardial infarction. Other factors modifying arrhythmia frequency are the presence of cardiogenic shock, the site of infarction, the use of digitalis, antiarrhythmic drugs, and vasopressor agents. If one averages the incidence of the various arrhythmias reported in the series of Meltzer and Kitchell,[4] of Day,[5] and Lown and his associates [6] (totaling 714 patients), the following results are obtained:

Premature Ventricular Beats—70%
Premature Atrial Beats—40%
Atrial or Nodal Tachycardia—9%
Atrial Flutter—3%
Atrial Fibrillation—9%
First Degree Heart Block—8%
Second Degree Heart Block—5%
Third Degree Heart Block—6%
Ventricular Tachycardia—21%
Ventricular Fibrillation—6%
Ventricular Asystole—5%

Understanding the pathogenesis of these arrhythmias is very important. James [7, 8] has meticulously studied the coronary arteries and has correlated the arrhythmias associated with coronary atherosclerosis with the location of the occlusive process. The sinus node is supplied by an artery originating from the proximal few centimeters of the right coronary artery in 55% of the cases studied, and from the proximal few millimeters of the left circumflex artery in 45% of the cases. The sinus node artery is usually the largest artery supplying much of both atrial walls, as well as the node.

The depressed or disorganized function of the sinus node is usually the major contributing factor to arrhythmias during acute myocardial infarction. In coronary occlusion, the sinus node will suffer from (a) hypoxia, (b) local tissue acidosis, and (c) the liberation of certain normal intracellular constituents eg, adenosine and potassium. Acidosis (resulting from hypoxemia) has two effects: It depresses the rate of sinus impulse formation, and it stimulates local ganglia to repetitive firing and certain neuroflexes. Adenosine has been found to have a profound negative chronotropic action. Occlusion proximal to the origin of the sinus node artery has the additional effect of interrupting the blood supply to many parts of both atria. This has two particular effects relative to the onset of atrial arrhythmias: The normal course of atrial impulse propagation becomes disorganized, leaving areas of focal ischemia. Some of these foci may assume automaticity and pacemaking, especially if the sinus node fails.

The AV node and the His bundle are supplied in 90% of the cases from the right coronary artery and in 10% of the cases from a branch of the left circumflex artery. The right coronary artery supplies most of the inferior and posterior areas of the ventricular myocardium. It is understood, therefore, why an acute heart block occurs mainly as a complication of inferior or posterior myocardial infarction. If, at some stage of injury, the AV node develops increased automaticity, it may assume pacemaking function, particularly if there is concomitant failure or depression of the sinus node. Since nerves and ganglia are numerous near the AV node, the bradycardia and other vagal phenomena, commonly noted during acute inferior myocardial infarction, are most likely caused by reflexes originating in such intracardiac neural centers.

The significance of an arrhythmia varies. Often, it is transient and of short duration causing no symptoms. At other times, arrhythmias may lead to disturbances of circulatory efficiency, and lesser arrhythmias may lead to death-producing ones. Angina, dyspnea, dizziness and syncope, congestive heart failure, hypotension, and cardiac arrest may be the result of arrhythmias.

Sinus bradycardia in an infarcted heart causes reduction in cardiac output, and may be associated with a variety of escape rhythms. It may also be the precursor of more intense vagal discharge, which may then lead to complete heart block or cessation of sinus activity. Sinus tachycardia, unless the heart rate is rapid enough to impair cardiac output, is not of great concern. The possibility of early heart failure should, however, be carefully excluded. Heart block of any degree in the presence of acute myocardial infarction is a bad sign, even though the chance of permanent block among survivors is small. First and second degree AV block sometimes progresses to third degree AV block, and is often associated with a high risk of other arrhythmias, including ventricular tachycardia and fibrillation. If the administration of Atropine eliminates the block, the vagal component is probably the major factor in its pathogenesis. Otherwise, local ischemia of the AV node and the His bundle are the major problems.

Two thirds of the cases of complete heart block occur in the first 24 hours post infarction. If the patient recovers from the myocardial infarction, the complete heart block disappears in most cases. Complete heart block is usually associated with inferior myocardial infarction. However, in about 25% of the cases, the complete block is due to anterior myocardial infarction. In these cases, the block is usually due to bilateral bundle branch block. The death rate is generally higher in cases of advanced and complete heart block associated with acute anterior myocardial infarction. Similarly, mortality appears to be higher in cases of complete heart block in which there is an idioventricular pacemaker with a wide QRS complex, as opposed to a QRS complex of normal duration and configuration.

Multifocal beats, bigeminy, or the imposition of a premature beat on the T wave of a preceding beat are more significant than unifocal beats. They usually precede ventricular tachycardia and ventricular fibrillation. Therefore, quick treatment of premature ventricular beats is necessary. It has been stated by Lown that when ventricular premature beats are controlled by continuous administration of an anti-arrhythmic drug, ventricular fibrillation can be almost completely prevented. It has been observed, however, by studying initial severity of expir-

memory loop electrocardiographic tracings, that ventricular fibrillation can occur soon after the appearance of a single premature ventricular beat.

Having an understanding of the incidence, pathogenesis, and significance of the various arrhythmias associated with acute myocardial infarction is of great importance for the proper therapeutic approach.

Free! • VALUABLE EXCUSES • Free!

and how to make them sound legitimate.

Check any of the following tried and true alibis which you would like to have substantiated, and we'll send you our Hotel Hershey brochure with all the ammunition.

☐ I WAS SITTING UP WITH A SICK FRIEND. Sick about that terrible hook he'd developed on the back nine. I helped him drown his sorrows in the Iberian Lounge.

☐ I HAD TO GO TO MY GRANDMOTHER'S FUNERAL. Twenty-three years ago. Then last week we had a ball splashing around the pool at Hotel Hershey.

☐ I WAS ONE OF THE SPEAKERS AT A MEDICAL CONVENTION. All I said was "Fore!", but they all listened. No place like Hershey's 72 holes for meeting AWOL medics.

☐ I WAS CALLED OUT ON A MISSION OF MERCY. My wife was dying to get away for a couple of days to Hotel Hershey, where the food is superb and she doesn't have to fix it.

☐ I HAD THIS IRRESISTIBLE COMPULSION TO HIDE. And what could be more secluded than those bridle paths and wooded riding trails around Hotel Hershey . . . gorgeous at this time of year.

☐ I DIDN'T KNOW IT WAS LOADED. The first time I went to Hotel Hershey, that is. Loaded with all good things of life that make even a few days a luxurious vacation. But man, did I ever come back there fast, once I'd found out!

Yes, please send me your brochure.

Business and Pleasure

Since last month's issue of the journal appeared, your librarian has covered quite a bit of territory, partly attending professional meetings and partly vacationing.

With the International Congress on Medical Librarianship convening in Amsterdam early in May, it was possible to continue traveling with the tour arranged by the Medical Library Association (US and Canada). Before leaving Holland, we visited Marken, Volendam, The Hague, Rotterdam, and other points of interest nearby. Then we flew to London for a week of sightseeing and theatre-going, including an all-day trip to Stratford on Avon for a beautiful production of *Winter's Tale*.

After London came Paris and the Scribe Hotel where we experienced our first hotel employee's strike and had the strange duty of making up our own room. But for this, however, it was a delightful hotel and most conveniently located—maybe *too* convenient to expensive restaurants and shops.

Paris was interesting, the food good, but could not surpass the Dutch cooking once we found the better restaurants. The first thing we needed to learn was to interpret traffic signs, else we found ourselves in the midst of onrushing swarms of small, noisy, sports cars. Everywhere, there were droves of bicycles, especially in Amsterdam and Paris; one didn't dare walk on the bicycle paths between the streets and walkways.

To go back to the congress, though, which was the real purpose of this trip, we arrived about 9 am after breakfast aboard the KLM plane, spent some time waiting for baggage for 150 persons, then out to the RAI Congress hall where we joined lines of other librarians already registering. By now, it was almost noon, and with no lunch, we stood till after 5 o'clock in order to register for the Congress, be assigned to a hotel, and *finally* pay for our hotel lodging before we were allowed to leave. This seemed, to say the least, very poor planning on the part of the committees. Unfortunately, this part of the process was handled by a travel organization, *not* the librarians.

After everyone finally adjusted to the loss of five hours and several meals en route, the Congress itself got off to a good start on Monday. Prince Bernhard welcomed the assemblage along with the various members of the Organization Committee, composed of representatives from many countries. The principal social events of the conference were the reception at the impressive Rikjsmuseum on Tuesday evening and an evening at the HET Nationale Ballet. Lacking were the usual planned banquet, and luncheon and dinner meetings for the attendants. This would have been impossible for a group this large.

Reviewing the program, it proves almost impossible to select papers which were most significant, though some stand out more vividly than others, such as one of the last papers delivered—Survey of work in Africa, presented by S. O. Falayi, from the Library of the College of the University of Lagos, Lagos, Nigeria. He drew a vivid picture of the lack of facilities, funds, book collections, information centers, *and* librarians to adequately solve their information problems.

Proceedings of the Congress are scheduled to appear in the fall of this year, and at intervals there will be references to other papers on this page.

* * * * *

Baltimore Hospital Librarians Association will again sponsor a program on medical libraries, especially hospital and nursing, at the Maryland-D.C.-Delaware Hospital Association in Washington, December 2, 1969.

* * * * *

Medical Library Association meeting will be held at the Brown Hotel, Louisville, Kentucky, October 26-30, 1969.

COURSE AND PROGNOSIS OF CHRONIC OBSTRUCTIVE LUNG DISEASE

A prospective study was undertaken to identify factors of importance in the prognosis of chronic obstructive pulmonary disease. Ventilatory capacity, resting heart rate, carbon dioxide levels, and the physician's assessment were the most useful indices.

A group of 200 patients with chronic obstructive lung disease were enrolled in a prospective study designed to document the course and prognosis of the condition. Patients accepted for the study were admitted to the hospital for initial and yearly follow-up examinations. At quarterly intervals they were also asked to fill in questionnaires.

The data obtained reflect the course of chronic obstructive lung disease under conservative and individualized medical management, rather than the natural history of the disease. At the end of one year of follow-up, 186 patients were alive. At the end of seven years, 35 were alive, 104 were known to be dead, and four were lost to follow-up. The over-all mortality was 50% before six years. The variables anaylzed were correlated with survival at three and five years. Initial characteristics found not to be significantly related to prognosis included age, sex, race, socioeconomic factors, sputum characteristics, bullae, and axis deviation on the electrocardiogram.

In determining three-year prognosis, the most useful indices were ventilatory capacity, resting heart rate, evidence of cardiac disease, measurements relating to hypercapnia, and physician's assessments of disease severity. Forced expiratory volume in one second (FEV_1), maximum voluntary ventilation, and maximum midexpiratory flow rate were also useful. Less useful were vital capacity (VC), FEV_1/VC ratio, diffusing capacity (D_1), and ratio of residual volume to total lung capacity or nitrogen washout curve. A prominent R wave in Lead V_4R was the most important electrocardiographic finding. Residual volume, total lung capacity, and history of dyspnea were not closely related to survival.

Only two deaths occurred among 31 patients with FEV_1's of 1.15 liters or more and resting pulse rates below 78 per minute. This was a lower mortality than expected for a normal population of the same age. However, there were but three survivors among 26 patients who had FEV_1's below 0.75 liter and pulse rates above 90 per minute.

In simple regressions, change in FEV_1 over two years did not correlate with subsequent survival, apparently because of the tendency of patients with the highest initial FEV_1's who have an excellent prognosis, to show the greatest decline in FEV_1. When initial FEV_1 was held constant in a multiple regression analysis, changes in FEV_1 over two years added significantly to the prediction of subsequent mortality. Thus, the course of expiratory slowing was a useful guide to prognosis if considered in conjunction with the initial FEV_1 level. The observed rate of change in diffusing capacity was also significantly related to subsequent survival when initial FEV_1 was held constant.

A multiple regression analysis that took into account observed changes in variables over two years, in addition to initial observations, indicated that the

atory slowing, the initial heart rate, and the rate of decline of expiratory flow rate were independently useful in prognosis. Consideration of these three features reduced the apparent prognostic value of other observations to insignificant levels.

Course of Findings

Most objective findings showed a systematic worsening with time in surviving patients. The FEV_1 appeared to fall approximately 75 ml per year, and courses of patients were more uniform than expected. At this rate the disease would need to progress for 20 to 30 years before ventilatory impairment became severe enough to produce clinically significant dyspnea. Once mild chronic dyspnea had developed, the expectation would be progression to severe disability from six to ten additional years. These durations are compatible with the clinical histories obtained from patients with the disease and suggest that the disease must begin quite early in life, perhaps even in childhood. An onset of disease in childhood is also suggested by the finding of early emphysematous changes in the lungs of teenagers dying of accidents or trauma.

It appears that the impression that chronic obstructive lung disease is a variable and unpredictable disorder with fluctuating abnormalities is the result of three things: the relatively small yearly changes in pulmonary function tests, the tendency of clinicians to remember exceptional cases, and the optimistic attitude of both patients and physicians.

Prognosis may be simply estimated as having clinical usefulness as follows:

With mild to moderate expiratory slowing (FEV_1 more than 1.15 liters) five-year expectancy is near normal in uncomplicated cases and close to 66% in patients with evidence of cardiac disease or tachycardia at rest.

With moderately severe ventilatory impairment (FEV_1 of 0.75 to 1.15 liters), there is a 66% five-year survival, but this figure is reduced to 33% if evidence of cardiac disease, tachycardia at rest, hypercapnia, or a very low pulmonary diffusing capacity is also present.

With very severe expiratory slowing (FEV_1 less than 0.75 liter), only 33% of patients without complications survive for five years, and five-year survival is unusual if there are any adverse features.

The relation of smoking habits to the course of the disease is difficult to assess. Patients who had stopped smoking before entering the study had a poorer survival than those who continued to smoke cigarettes, but this was related to a tendency of patients to stop smoking when their disease became severe.

Therapeutic Implications

There is a general tendency for the disease to worsen, and this trend becomes increasingly evident as patients are followed for a prolonged period. This generally unfavorable course should not be used to justify a nihilistic attitude toward therapy. There is little doubt that symptomatic relief may be obtained in many patients with severe hypoxemia and cor pulmonale or with recurrent acute exacerbations, but the gradual deterioration of most patients with chronic obstructive lung disease is not prevented by currently available therapy.

ROBERT E. FARBER, MD, MPH, COMMISSIONER

Baltimore City health department

New Sanitary Enforcement Program

A new Sanitary Enforcement Program has been established by the City Health Department in an effort to prevent further deterioration of city neighborhoods.

In this program, 34 uniformed personnel under the direction of John F. Block, Chief of the Division of Sanitary Enforcement, will serve 124,000 dwelling units and other properties, chiefly in outer city areas. The inner city is now under attack by the Department's Rat Eradication Program. Together, in time, both programs will provide a continuing surveillance of potentially hazardous environmental conditions throughout the entire city and the direction of citizen efforts for their correction or elimination.

The program is the result of recommendations of the Special Summer Sanitation Committee organized by William Donald Schaefer, President of the Baltimore City Council, and chaired by Councilman William J. Myers. Last year, this committee recommended a comprehensive city-wide educational and enforcement program to eliminate and prevent the recurrence of unsanitary conditions in the city. The new enforcement program will help meet this need and also fill the void created by the elimination of the sanitary police division of the Police Department.

In the new attack on this old problem, sanitary enforcement officers will provide comprehensive person-to-person education of the public to eliminate exterior unsanitary conditions and to maintain improved environmental conditions.

Education for correction will be applied to the following: Unsanitary conditions for yards and vacant lots, high grass and weeds, improper refuse disposal, minor rat and insect infestation, unsanitary conditions caused by birds and animals, dilapidated exterior structures, unsanitary vacant structures, defective drainage on private properties, streets, and alleys, and all other problems of exterior environmental sanitation.

In addition to the education program, the City Health Department enforcement personnel have the power under existing city ordinances to carry out the program without any delegation of authority to some other agency. Close cooperation, however, will be maintained with the Department of Housing and Community Development, the Bureau of Consumer Services, the Bureau of Utilities Operations, and the Baltimore Police Department.

Preliminary Results

In a preliminary 14-week period of field duty, begun March 1, over 166,400 inspections were made, over 14,400 notices were given out, and 17 court summonses were issued. In addition, instructional talks have been presented to neighborhood and civic groups by Mr. Block and other staff members.

With this favorable beginning, the Division of Sanitary Enforcement should prove to be an effective new tool in improving the city's environment. Its focus on education, self-help, and pride in a clean city will strongly complement and reinforce the new Clean City Crusade now underway by the Department of Public Works and cooperating agencies.

Area Offices

The four areas served and their chief administrative offices are as follows:

DOWNTOWN DISTRICT Baltimore & South Sts.

Book Reviews

GENETICS AND COUNSELING IN MEDICAL PRACTICE, Reisman, and Matheny; The C. V. Mosby Company, St. Louis, 1969.

By providing a broad coverage of genetic information, this book hopes to aid the family physician in advising his patients. With this in mind, the authors have tried to orient their discussions of genetic disorders to the topics and questions most likely to arise in genetic counseling. To some extent, then, this book is a manual (or perhaps a primer) for genetic counseling in medical practice —not an exhaustive treatise on medical genetics.

ORGANIZATION AND ADMINISTRATION OF HEALTH CARE, Durbin and Springall; The C. V. Mosby Company, St. Louis, 1969.

The title of this book may be misleading, for it is primarily directed at the hospital system we know today in America. It is intended to convey to all those in the health field the necessity for the application of business and administrative techniques to hospital management.

The authors are innovative and persuasive in their arguments, as well as responsive to a great need in an enormously important sector of our national effort. Great stress is placed on the use of systems analysis and computers.

In addition, judging from the text of the book, the authors believe a complete reorganization of the administratve structure of hospitals should take place. Their suggestions range from business and finance to improved patient care.

While theory may be great insofar as it goes, the actual changing of existing patterns will take a long time to accomplish.

THERAPEUTIC RADIOLOGY: RATIONALE, TECHNIQUE, RESULTS, Moss and Brand; The C. V. Mosby Company, 1969.

The third edition of this book has resulted in many revisions, and the addition of illustrations and current concepts.

The book does not claim to be a recipe nor an encyclopedia of radiotherapy. It is designed to serve as an introduction to certain selected clinical problems in therapeutic radiology which, in turn, will lead to improved patient care. Practical

answers are given to practical questions.

This book is a must for all medical libraries, particularly those associated with the teaching of radiology.

HANDBOOK OF PEDIATRIC CARDIOLOGY, Krovetz, Gessner, and Schiebler; Harper & Row, New York, 1969.

This book has been written in recognition of the confusion which may overcome the medical student in his first encounter with the study of congenital heart disease. In order to help him discern between an almost endless variety of possible anomalies, the book has emphasized the fundamentals of pediatric cardiology. It curtails its comments on rarer anomalies while dwelling on the more common disease entities.

General practitioners, pediatricians, and medical students especially, may find this a useful book to add to their reference libraries.

POST-TRAUMATIC PULMONARY INSUFFICIENCY, Moore, et al; W. B. Saunders Company, Philadelphia, 1969.

Perhaps the most interesting facet of this book is its subject matter: patients in the prime of life. In an effort to discover the processes ultimately responsible for the death of young patients who are healthy and socially effective prior to injury (terminal mechanisms in salvageable patients), the authors have presented their observations with a series of longitudinal studies of critically ill patients. The studies were initiated in the summer of 1963.

As the authors themselves say, "It is our purpose to bring together the many facets of patients we have studied, and so to assemble the clinical syndrome as it is seen in patients after resuscitation from tissue injury."

SYMPOSIUM ON THE SPINE, American Academy of Orthopaedic Surgeons; The C. V. Mosby Company, St. Louis, 1969.

As indicated by the preface, the source material for this monograph was taken from the presentations made by the faculty of the continuing education course entitled "Current Concepts on Management of Disease and Injury Involving the Spine." The Symposium was held in 1967, and included such specialties as orthopaedic surgery, neurosurgery, neurology, general surgery, internal medicine, physiatrics, radiology, and general practice. The faculty included those contributions on the "back" which have influenced current diagnostic and therapeutic trends.

It serves as an excellent review of "back" problems for all interested physicians.

On the Hospitalization of Drug Addicts

A record 316 admissions with a diagnosis of drug addiction were reported last year by Maryland's mental hospitals. An additional 26 were admitted for acute drug intoxication. These 342 admissions by 314 persons, in most cases, involved a single treatment episode. Their distribution by race, sex and number of admissions during the year is shown in the following table.

	TOTAL	WHITE MALE	WHITE FEMALE	NONWHITE MALE	NONWHITE FEMALE
NUMBER OF ADMISSIONS	342	126	39	138	39
NUMBER OF PERSONS ADMITTED	314	115	39	126	34
1 ADMISSION	289	105	39	115	30
2 ADMISSIONS	22	9	—	10	3
3 ADMISSIONS	3	1	—	1	1
RATE*	14.0	11.8	3.9	73.2	19.2

Of these 314 persons admitted, 78.1% lived in Baltimore city, 76.8% were male, 83.6% were less than 35 years of age, 71.9% were single, separated, or divorced, and 64.6% reported no previous hospitalization in a psychiatric facility. Proportionally, admissions were in the ratio of six to one between nonwhite and white males and five to one between nonwhite and white females.

Although the Department collects data on drug abuse or dependency of all patients, the 524 cases reported last year probably represent an underenumeration, since this may not be recognized or noted in each instance. Of these 524 patients, 100 were users of two or more specified drugs. The major categories noted were narcotics—386, depressants—125, stimulants—62, and hallucinogens—48. That is, more than three fourths were stated to be users of narcotics, primarily heroin.

As with alcoholics, successful treatment is difficult since it requires complete withdrawal, motivation necessary for continued abstinence, development of constructive influences, and resolution of underlying factors related to the problem. In the United States the most noted treatment facilities are maintained by the National Institute of Mental Health at Lexington, Kentucky, and Fort Worth, Texas. They have reported that only a small proportion of former patients manage to abstain from drugs for any extended time period.

Ultimate efforts to minimize the number of addicts are dependent on a two-fold program for the prevention of new cases and the successful treatment of present users. The former depends on continuing efforts to determine the addictiveness of various drugs, to reduce available supplies, and to resolve socio-economic and psychological factors relating to initial drug use. The latter requires the development of closely coordinated treatment and aftercare services involving public and private agencies, as well as organized groups of former users such as, Addicts Anonymous and Synanon.

** Number of persons admitted per 100,000 estimated population 18 years of age or older in specified race-sex group.*

Better Emergency Care Sought for Highway Crash Victims

Improved in-hospital emergency treatment of highway crash victims is the aim of a new educational program to be launched by the American College of Surgeons, with financial assistance from the Insurance Institute for Highway Safety.

Dr. William Haddon, Jr., Institute president, announced today that a $15,000 grant had been made to enable the College's Committee on Trauma to undertake the program. The College is matching this amount and also will seek additional funding to expand the program.

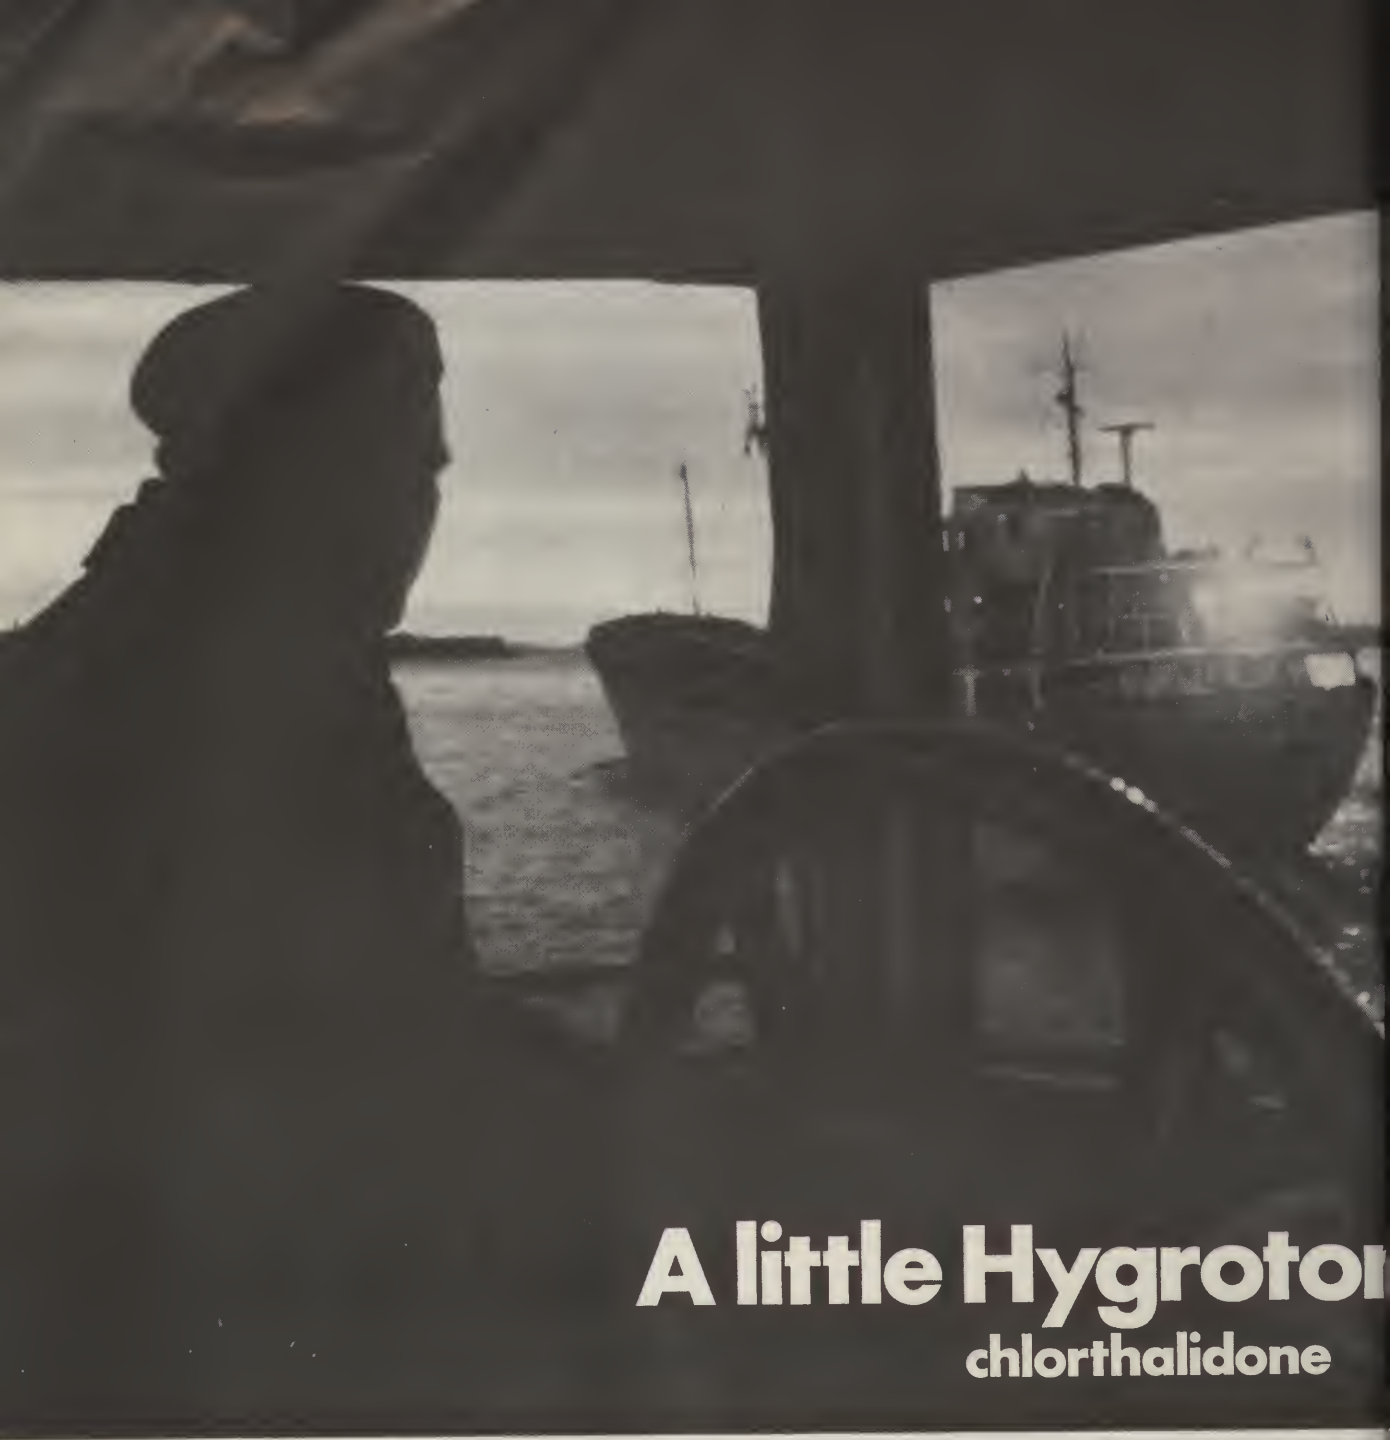
Beginning with three eight-week educational projects for physicians to be conducted by members of the College of Surgeons in several parts of the country in rural areas, the program will be expanded nationwide. A majority of deaths from highway injuries result from crashes occurring far from urban medical centers.

"As physicians and surgeons know, emergency medical care needs, whether on-site or in the hospital, have too long been neglected by the highway safety movement," said Dr. Haddon. "It is gratifying that the College of Surgeons is taking this step to improve the treatment of the injured."

In accepting the Institute grant, Dr. John Paul North, director of the College, said: "The Committee is conducting nation-wide educational activities to improve the immediate care and transportation of the injured before they reach hospitals. The College now wants to broaden its trauma program by including emphasis on the closely related in-hospital emergency treatment of the injured.

"At this time there is no organized, comprehensive program of continuing medical education for physicians in emergency life-saving measures for critcally injured highway crash victims. Particularly no program exists to provide such education for physicians in their home communities and in the environment of the hospitals in which they practice."

The new program will be under the staff direction of Dr. Oscar P. Hampton, assistant director of the College for trauma activities.



"Comprehensive curricula will be developed for a series of weekly or twice-a-week educational sessions," Dr. Hampton said. "On-site instructional courses will be given by teams of surgeons from the College's Committee on Trauma, or from its state and provincial committees on trauma, to physician-students from the surrounding areas. Visual and printed educational aids will supplement the instruction."

Chairman of the Committee on Trauma of the American College of Surgeons is Dr. Curtis P. Artz, professor of surgery and chairman of the department of surgery, Medical College of South Carolina, Charleston.

A little Hygroton

chlorthalidone

an work a long diuretic day

he way from one daily tablet to the next
elp control edema and hypertension

rolonged action usually provides smooth, sustained diuretic
ctiveness; real one-a-day dosage, right from the start; convenience
economy.

roton, chlorthalidone, can cause side effects. And it's contra-
cated in hypersensitivity to the drug and severe renal and
atic diseases.

ck the prescribing information. It's summarized on the next page.

Geigy

A little Hygroton® can work a long diuretic day

chlorthalidone

Indications: Hypertension and many types of edema involving retention of salt and water.

Contraindications: Hypersensitivity and most cases of severe renal or hepatic diseases.

Warning: With the administration of enteric-coated potassium supplements, which should be used only when adequate dietary supplementation is not practical, the possibility of small-bowel lesions (obstruction, hemorrhage, and perforation) should be kept in mind. Surgery for these lesions has been required frequently and deaths have occurred. Discontinue enteric-coated potassium supplements immediately if abdominal pain, distention, nausea, vomiting, or gastrointestinal bleeding occur.

Use with caution in pregnant women and nursing mothers since the drug may cross the placental barrier and appear in cord blood and since thiazides may appear in breast milk. The drug may result in fetal or neonatal jaundice, thrombocytopenia, and possibly other adverse reactions which have occurred in the adult. When used in women of childbearing age, balance benefits of drug against possible hazards to fetus.

Precautions: Antihypertensive therapy with this drug should always be initiated cautiously in postsympathectomy patients and in patients receiving ganglionic blocking agents, other potent antihypertensive drugs or curare. Reduce dosage of concomitant antihypertensive agents by at least one-half. Because of the possibility of progression of renal damage, periodic determination of the BUN is indicated. Discontinue if the BUN rises or liver dysfunction is aggravated. Hepatic coma may be precipitated.

Electrolyte imbalance, sodium and/or potassium depletion may occur. If potassium depletion should occur during therapy, the drug should be discontinued and potassium supplements given, provided the patient does not have marked oliguria.

Take special care in cirrhosis or severe ischemic heart disease and in patients receiving corticosteroids, ACTH, or digitalis. Salt restriction is not recommended.

Adverse Reactions: Nausea, gastric irritation, vomiting, anorexia, constipation and cramping, dizziness, weakness, restlessness, hyperglycemia, glycosuria, hyperuricemia, headache, muscle cramps, orthostatic hypotension, which may be potentiated when chlorthalidone is combined with barbiturates, narcotics or alcohol, aplastic anemia, leukopenia, thrombocytopenia, agranulocytosis, impotence, dysuria, transient myopia, skin rashes, urticaria, purpura, necrotizing angiitis, acute gout, and pancreatitis when epigastric pain or unexplained G.I. symptoms develop after prolonged administration. Other reactions reported with this class of compounds include: jaundice, xanthopsia, paresthesia, and photosensitization.

Average Dosage: 50 or 100 mg. with breakfast daily or 100 mg. every other day.

Availability: White, single-scored tablets of 100 mg. and aqua tablets of 50 mg., in bottles of 100 and 1000.

(B)46-230-E

HY-6674

Baltimore County Medical Association

A dinner was held at the Dobb's House in Catonsville on Wednesday, June 18, 1969.

Mrs. Roger Windsor, President of the Woman's Auxiliary, was introduced, and stated that through the generosity of the doctors, the Auxiliary is able to present a Nursing Scholarship each year. She then introduced Mrs. Delmas Caples, Chairman of the Scholarship Selection Committee, and Miss Paula Mugowski, the recipient of the scholarship. Miss Mugowski graduated from Overlea High School and will enter the School of Nursing at the Church Home and Hospital this fall.

The Rev. Oscar Carlson, Pastor Emeritus of the Ascension Luthern Church in Towson, was introduced. He spoke of his experiences while serving aboard the S. S. Hope. The S. S. Hope is considered a "People to People" Program in which volunteer physicians, nurses, and allied personnel serve two months without compensation. The ship stays in one port for ten months, but there must be a medical school within 25 miles before the ship can dock. The idea was conceived by the late President Eisenhower when the government lent a ship known as the U. S. S. Consolation, which, since then, has been renamed the S. S. Hope. This is the only interest the government has taken in this project.

Every doctor, nurse, etc. who serves aboard the ship must have a counterpart in the country in which the ship is working. Rev. Carlson brought some very colorful and interesting slides showing the ship and the country that he visited.

Following Rev. Carlson's discussion, the business meeting was called to order.

AD Hoc Committee to Study Family Life and Sex Education

James Drinkard, MD, Chairman, reported that the committee studied in depth the materials to be used in the program, teacher preparation, teacher characteristics, and other areas of inquiry that the committee considered pertinent. Three meetings were held, and Dr. Benjamin Ebersole and Mrs. Mary Satterlie from the Department of Education were present at the last meeting. The committee was assured that the films, "Boy To Man" and "Girl To Woman", will be shown to segregated groups of boys and girls, that the boys will see their film and vice versa, and that these films are intended to be a final review of the course. Considerable concern was generated by the statement in the film, "Boy To Man", that masterbation is not harmful. The committee was assured that such a statement would be preceded by formal didactic teaching to the effect that no physical harm may be done by masterbation, but that excessive masterbation may indicate emotional problems. The committee recommended parental involvement in an informational and advisory capacity.

Teacher preparation was discussed at considerable length. Teachers who plan to begin the sixth grade pilot program will soon begin their preparation in the summer workshop. The committee reviewed the qualifications of the advisors to the teachers and found them quite acceptable. The education officials assured the committee that those summer workshops will be open to medical consultants and parents. The Board of Education officials are attempting to plan the classes so that they may be attended by the principal, vice principal, or someone from the Department of Education who is knowledgeable in this field. The board officials assured the committee they would be glad to listen to suggestions from the PTA's of the various schools. In general, the plan is to have the assigned sixth grade teacher as the instructor. Dr. Ebersole suggested the following guidelines that will be strictly adhered to: (1) Individual school principals must approve the teacher; (2) All teachers will be instructed in the basic information necessary to teach the course; (3) Teachers must be of proven competence, ie, there will be no first year teachers; (4) All teachers must have at least their Bachelor's degree; (5) All teachers must have already worked in health education; (6) All teachers must have demonstrated proficiency in working with students individually; (7) All teachers in this course will have their references closely reexamined; (8) Supervision will be closer in this field than any other, as outlined above; and (9) If no competent teacher is avaliable, there will be no course in Family Life and Sex Education.

By a four to three vote, the committee passed the following resolution: If the question of premarital relations is raised by a pupil, and if in the judgment of the teacher further discussion is necessary, we strongly recommend that possible adverse effects of such premarital relations be included in the discussion.

The committee concluded its work with the unanimous passage of the following motions:

1. This committee approves of the proposed sixth grade pilot program in Family Life and Sex Education—with the Recommendations aforecited.
2. An advisory committee of no less than five members of this association shall be established to act in an advisory capacity to the Baltimore County Board of Education and Baltimore County School Officials.

The members of the committee were John Snyder, MD, Barbara Solomon, MD, Ramsay Thomas, MD, Frank Kasik, MD, John Krager, MD, John Gibbs, MD, and James Drinkard, MD. Dr. O'Donnell and Dr. Reese attended the meetings as consultants.

Dr. Reese moved that the report of the ad hoc committee be received. Motion was seconded and carried.

Dr. O'Donnell introduced the following resolutions:

"The Baltimore County Medical Association, having carefully studied the instructional materials in the Baltimore county sixth grade pilot program in Family Life and Sex Education, and having received free assurance from the responsible Baltimore county educators of their plans to:

1. Separate boys and girls during sensitive instructional times
2. Involve the parents in both informational and advisory capacity
3. Select, train, and supervise the teachers with great care
4. Teach the course in a family-life ethical framework
5. Request the Baltimore County Medical Association to appoint a committee to advise and guide the Baltimore County Board of Education in the medical and psychiatric aspects of Family Life and Sex Education

Does hereby give its endorsement and approval to the program.

The Baltimore County Medical Association requests Dr. Gibbs to act as the original chairman and appoint a committee of no less than five members for society endorsement to advise and guide the Baltimore County board of education in their Family Life and Sex Education Program. This committee to serve until the annual meeting of 1971, by which time the Bylaws Committee shall have incorporated such a committee in the Bylaws as a standing committee with provisions for change, yet continuity of membership."

After an in depth discussion, the resolution as proposed, was passed with only one dissenting vote.

There being no further business, the meeting was adjourned.

John M. Krager, MD

CLINICAL CENTER STUDY OF HEMOLYTIC ANEMIA

The cooperation of physicians is requested in the referral of patients for studies of idiopathic auto-immune hemolytic anemia being conducted by the National Institute of Health, Bethesda, Maryland.

Referrals of patients with Coombs' positive idiopathic auto-immune hemolytic anemia are needed. Also, selected patients with secondary types of auto-immune hemolytic anemia, especially of the cold antibody type, will be accepted. Preference will be given to patients who have not received previous treatment.

Studies will be performed to determine the type of antibodies involved and the role of complement in hemolysis. Following this, patients in need of therapy will be treated, and experimental drugs may be used. All patients will be carefully followed during the course of the study. On completion of their studies, patients will be returned to the care of the referring physician who will receive a summary of findings.

Physicians interested in having their patients considered for admission to these studies may write or telephone.

Convalescing . . . but still a long way to go. Anxiety can make it even longer.

Convalescence following medical or surgical procedures may be almost endless to an anxious patient. And, indeed, anxiety with some patients actually retards progress—for example, by inducing insomnia and reducing cooperation.

As physicians have found during nearly 15 years of widespread use, Equanil may be a beneficial part of aftercare. It helps relieve anxiety and tension, thus often aiding your primary therapy.

Indications: For use in management of anxiety and tension occurring alone or as accompanying symptom complex to medical and surgical disorders and procedures. Though not a hypnotic, fosters normal sleep through antianxiety and related muscle-relaxant properties.

Contraindications: History of sensitivity to meprobamate.

Important Precautions: Carefully supervise dose and amounts prescribed, especially for patients prone to overdose themselves. Excessive prolonged use has been reported to result in dependence or habituation in susceptible persons, as alcoholics, ex-addicts, and other severe psychoneurotics. After prolonged excessive dosage, reduce dosage gradually to avoid possibly severe withdrawal reactions. Abrupt discontinuance of excessive doses has sometimes resulted in epileptiform seizures.

Warn patients of possible reduced alcohol tolerance, with resultant slowing of reaction time and impairment of judgment and coordination.

Reduce dose if drowsiness, ataxia or visual disturbance occurs; if persistent, patients should not operate vehicles or dangerous machinery.

Side Effects include drowsiness, usually transient; if persistent and associated with ataxia, usually responds to dose reduction; occasionally concomitant CNS stimulants (amphetamine, mephentermine sulfate) are desirable. Allergic or idiosyncratic reactions are rare, but such reactions, sometimes severe, can develop in patients receiving only 1 to 4 doses who have had no previous contact with meprobamate. Previous history of allergy may or may not be related to incidence of reactions. Mild reactions are characterized by itchy urticarial or erythematous maculopapular rash, generalized or confined to groin. Acute nonthrombocytopenic purpura with cutaneous petechiae, ecchymoses, peripheral edema and fever have been reported. One fatal case of bullous dermatitis following intermittent use of meprobamate with prednisolone has been reported. If allergic reaction occurs, meprobamate should be stopped and not reinstituted. Severe reactions, observed very rarely, include angioneurotic edema, bronchial spasms, fever, fainting spells, hypotensive crises (1 fatal case), anaphylaxis, stomatitis and proctitis (1 case) and hyperthermia. Treat symptomatically as with epinephrine, antihistamine and possibly hydrocortisone. Aplastic anemia (1 fatal case), thrombocytopenic purpura, agranulocytosis and hemolytic anemia have occurred rarely, almost always in presence of known toxic agents. A few cases of leukopenia, usually transient, have been reported on continuous administration.

Meprobamate may sometimes precipitate grand mal attacks in patients susceptible to both grand and petit mal. Extremely large doses can produce rhythmic fast activity in the cortical pattern. Impairment of accommodation and visual acuity has been reported rarely. After excessive dosage for weeks or months, withdraw gradually (1 or 2 weeks) to avoid recurrence of pretreatment symptoms (insomnia, severe anxiety, anorexia). Abrupt discontinuance of excessive doses has sometimes resulted in vomiting, ataxia, tremors, muscle twitching and epileptiform seizures. Prescribe very cautiously and in small amounts for patients with suicidal tendencies. Suicidal attempts have resulted in coma, shock, vasomotor and respiratory collapse and anuria. Excessive doses have resulted in prompt sleep; reduction of blood pressure, pulse and respiratory rates to basal levels; and occasionally hyperventilation. Treat with immediate gastric lavage and appropriate symptomatic therapy. (CNS stimulants and pressor amines as indicated.) Doses above 2400 mg./day are not recommended.

Composition: Tablets, 200 mg. and 400 mg. meprobamate. Coated Tablets, WYSEALS® EQUANIL (meprobamate) 400 mg. (All tablets also available in REDIPAK® [strip pack], Wyeth.) Continuous-Release Capsules, EQUANIL L-A (meprobamate) 400 mg.

One Surgeon's Views On Fixed Fee Dilemma

One of the great dilemmas of American surgery today is the issue of the fixed professional fee versus a fee based on each surgeon's own increasing costs. It's a controversial subject, one on which the general public is little informed and on which surgeons themselves do not always agree.

In the letter below, Richard L. Meiling, dean of the Ohio State University College of Medicine, spells out the essentials of the situation as well as anyone ever has. It was written, originally, in response to a question concerning Medicare and its financial aspects put to Dr. Meiling by Robert M. Zollinger, chairman of the American College of Surgeons Communications Committee. It is being reprinted here solely for the information of the Fellows, and in no way reflects official College policy. Nor does it represent any official action by the Board of Regents.

Dr. Meiling, formerly, served as Director of Medical Services, Department of Defense, from 1949 through 1951.

"In my opinion, what is actually happening is that you're talking about (1) patient fees and patient-physician relationship; and (2) a highly-technical, economically-oriented insurance industry.

"These are two very separate questions. If you take the insurance program and Medicare as being developed as an indemnity program, the individual has to be paid and the industry, itself, has to pay taxes. In most instances it is not a nonprofit organization, and yet everybody agrees that the industry, per se, has the right to all these perquisites, costs, labor costs, etc., in the administration of an indemnity program.

"Now, as to the patient, the fee, and the physician. Congress in its great wisdom, or in its lack of same, has said that everyone over the age of 65 shall be treated the same regardless of financial status or the patient's desire for private room, private nurses, etc. It's hard to put in words the fact that if you used fixed fee schedules, the physicians or dentists or druggists who will make money on this basis are not necessarily the best qualified nor members of the group delivering the best type of health care.

"I don't think the Board of Regents can solve this problem. And any delightful platitude which they wish to give would probably be accepted by the membership and the public, depending on the public relations presentation of this platitude.

"You come right down to the basic reality that the surgeon or physician is, in fact, an industry; he has labor costs, insurance costs, etc., that have increased tremendously in the past several years, so his usual and customary fee is going to have to increase proportionately to cover the increased costs of doing business.

Nobody questions this in the insurance business because as labor costs, taxes, etc. increase premiums are increased.

"On the other hand, the surgeon is expected to do his surgical procedure at the same price he did it 20 years ago, notwithstanding the fact that he may be paying 300% more for his office nurse and his office secretary, 600% more for his insurance and liability coverage, and 800% more for his rent of office, his parking and his car.

"I would hope that some high group, the Board of Regents or some other group, would begin to show what these costs are. For example, the increase in professional liability from $200 to $800 in three years, or the increase from $300 per month for a secretary to $1000 per month in many instances today. I can remember when an office could be rented for $1.80 per square foot. The same space costs $6.50 today.

"The problem is to present to the public exactly what's involved in a professional fee. The public thinks of this fee as a fee for service, and this service is personal. They have no appreciation of what it costs every morning for that surgeon to leave his home and begin the delivery of personal care. Before he steps out of the house he must pay income tax and surtax, city income tax, state taxes, liability insurance, life insurance, group insurance, the salary of a secretary and an office nurse, the rental liability protection of his office space and his equipment, his automobile and gasoline taxes; all of this, plus his continuing education in the field of his specialty, before he's taken that first step out of his front door. This is the way business approaches the cost of a product. Now, it costs so much to market that product; and in our society it is reasonable to expect amortization of costs, maintenance of buildings, replacement of equipment, education of personnel, endowment programs, etc., which the purchaser must pay before he gets the item being sold. On all of this there must be a profit margin.

"If it were possible to present this in either animation or actual living movie, maybe Congress and the

public would understand why medical fees and surgical fees are not and cannot be what they were "x" number of years ago. Likewise, if you go to a program with "fixed fee schedules" then medical groups, in all probability, would go bidding for patients in a manner similar to which a bank or insurance company bids for municipal or school bonds. The public will get, then, exactly what they pay for; no more and no less. It may be good, it may be poor and, like many products they buy every day, it may be fragile and breakable; but until the medical porfession is able to present its side of the story, we'll have trouble."

AN ANNOUNCEMENT TO MARYLAND PHYSICIANS WHOSE PATIENTS HAVE CHRONIC SLEEP DISTURBANCE

Recent advances in sleep research have made it possible to measure a variety of sleep disorders in otherwise normal patients.

To further these studies a clinic is being established at the Maryland State Psychiatric Research Center under the direction of Dr. Clinton Brown, Chief of Basic Sciences Research.

The primary purpose of this clinic will be to investigate the variables producing insomnia so that more effective treatment approaches may be formulated.

Of interest are: 1) the personality configuration, 2) sleeping habits and 3) psychophysiologic reactivity of the patient with chronic complaints of inability to fall asleep, frequent or early awakenings, somnambulism, enuresis or nightmares.

Individuals accepted for study will be given a physical exam, interview, psychometric test and polygraph recordings obtained during sleep.

Patients will be accepted by referral only and a diagnostic report will be furnished to the referring physician at the conclusion of the study.

Partial support for this project is being furnished by Friends of Psychiatric Research, a non-profit research foundation. While fees will not be charged, voluntary contributions by patients to offset study costs will be welcomed.

Additional information or appointment may be obtained by calling Mrs. Zaborowski at 744-8700, Ext. 252, 10 A.M. to 4 P.M. Monday thru Friday.

CLINICAL CENTER STUDY OF CYSTINOSIS

The cooperation of physicians is requested in the referral of patients with cystinosis to participate in studies being conducted by the National Institute of Arthritis and Metabolic Diseases at the Clinical Center, National Institutes of Health in Bethesda, Maryland.

Of particular interest are pregnant women who are mothers of cystinotic patients. There is reason to believe that in-utero diagnosis of cystinosis can be achieved. Thus we are especially interested in studying women, as early in pregnancy as possible, who are at risk for giving birth to a cystinotic child.

Physicians who wish to have their patients considered for these studies may write or telephone.

When disease is ruled out and psychic tension is implicated

Valium® (diazepam) helps relax the patient and relieve his somatic symptoms

Before prescribing, please consult complete product information, a summary of which follows:

Indications: Tension and anxiety states; somatic complaints which are concomitants of emotional factors; psychoneurotic states manifested by tension, anxiety, apprehension, fatigue, depressive symptoms or agitation; acute agitation, tremor, delirium tremens and hallucinosis due to acute alcohol withdrawal; adjunctively in skeletal muscle spasm due to reflex spasm to local pathology, spasticity caused by upper motor neuron disorders, athetosis, stiff-man syndrome, convulsive disorders (not for sole therapy).

Contraindicated: Known hypersensitivity to the drug. Children under 6 months of age. Acute narrow angle glaucoma.

Warnings: Not of value in psychotic patients. Caution against hazardous occupations requiring complete mental alertness. When used adjunctively in convulsive disorders, possibility of increase in frequency and/or severity of grand mal seizures may require increased dosage of standard anticonvulsant medication; abrupt withdrawal may be associated with temporary increase in frequency and/or severity of seizures. Advise against simultaneous ingestion of alcohol and other CNS depressants. Withdrawal symptoms have occurred following abrupt discontinuance. Keep addiction-prone individuals under careful surveillance because of their predisposition to habituation and dependence. In pregnancy, lactation or women of childbearing age, weigh potential benefit against possible hazard.

Precautions: If combined with other psychotropics or anticonvulsants, consider carefully pharmacology of agents employed. Usual precautions indicated in patients severely depressed, or with latent depression, or with suicidal tendencies. Observe usual precautions in impaired renal or hepatic function. Limit dosage to smallest effective amount in elderly and debilitated to preclude ataxia or oversedation.

Side Effects: Drowsiness, confusion, diplopia, hypotension, changes in libido, nausea, fatigue, depression, dysarthria, jaundice, skin rash, ataxia, constipation, headache, incontinence, changes in salivation, slurred speech, tremor, vertigo, urinary retention, blurred vision. Paradoxical reactions such as acute hyperexcitec states, anxiety, hallucinations, increased muscle spasticity, insomnia, rage, sleep disturbances, stimulation, have been reported; should these occur, discontinue drug. Isolated reports of neutropenia, jaundice; periodic blood counts and liver function tests advisable during long-term therapy.

When he needs an antibiotic
he may be a candidate for

DECLOSTATIN® 300

Demethylchlortetracycline HCl 300 mg
and Nystatin 500,000 units
CAPSULE-SHAPED TABLETS Lederle

b.i.d.

To guard susceptible patients against intestinal monilial overgrowth during broad-spectrum therapy—the protection of nystatin is combined with demethylchlortetracycline in DECLOSTATIN.

For your susceptible candidates, prescribe DECLOSTATIN—the broad-spectrum therapy that prevents monilial overgrowth.

Effectiveness: Because its antibacterial component is DECLOMYCIN Demethylchlortetracycline, DECLOSTATIN should be equally or more effective therapeutically than other tetracyclines in infections caused by tetracycline-sensitive organisms. The antifungal component, Nystatin, protects against superinfection by antibiotic-resistant fungal overgrowth (particularly monilia) in the intestinal tract.

Contraindication: History of hypersensitivity to demethylchlortetracycline or nystatin.

Warning: In renal impairment, usual doses may lead to excessive accumulation and liver toxicity. Under such conditions, lower than usual doses are indicated, and, if therapy is prolonged, serum level determinations may be advisable. A photodynamic reaction to natural or artificial sunlight has been observed. Small amounts of drug and short exposure may produce an exaggerated sunburn reaction which may range from erythema to severe skin manifestations. In a smaller proportion, photoallergic reactions have been reported. Patients should avoid direct exposure to sunlight and discontinue drug at the first evidence of skin discomfort. Necessary subsequent courses of treatment with tetracyclines should be carefully observed.

Precautions: Overgrowth of nonsusceptible organisms may occur. C stant observation is essential. If new infections appear, appropri measures should be taken. In infants, increased intracranial press with bulging fontanels has been observed. All signs and symptoms h disappeared rapidly upon cessation of treatment.

Side Effects: Gastrointestinal system—anorexia, nausea, vomiting, di rhea, stomatitis, glossitis, enterocolitis, pruritus ani. Skin—maculop ular and erythematous rashes; a rare case of exfoliative dermatitis l been reported. Photosensitivity; onycholysis and discoloration of t nails (rare). Kidney—rise in BUN, apparently dose related. Transi increase in urinary output, sometimes accompanied by thirst (rar Hypersensitivity reactions—urticaria, angioneurotic edema, anaphylax Teeth—dental staining (yellow-brown) in children of mothers given t drug during the latter half of pregnancy, and in children given the dr during the neonatal period, infancy and early childhood. Enamel hyp plasia has been seen in a few children. If adverse reaction or idios crasy occurs, discontinue medication and institute appropriate thera Demethylchlortetracycline may form a stable calcium complex in a bone-forming tissue with no serious harmful effects reported thus in humans.

Average Adult Daily Dosage: 150 mg q.i.d. or 300 mg b.i.d. Should given 1 hour before or 2 hours after meals, since absorption is impair by the concomitant administration of high calcium content drugs, foo and some dairy products. Treatment of streptococcal infections shou continue for 10 days, even though symptoms have subsided.

Maryland State
Medical Journal

VOLUME 18 SEPTEMBER 1969 NUMBER 9

CONTENTS:

Guest Editorial—Service Program—American Cancer Society, Maryland Division, Inc., Edward A. Sawada, MD 60

Psychiatry for the Family Physician, William L. Stewart, MD 62

The Drug Issue, Murdock Head, MD 63

"The problems of the inner city are directly related to the environment. A great many of our concerns, particularly in the psychiatric area, are related to the environment. The drug issue is one of these."

Recognizing the Suicidal Patient, Bernard R. Shochet, MD 65

"Depression is a serious systemic disease with psychological and physiological expression, of which suicide is very much a part. The person seriously contemplating suicide does this from a sense of profound despair and feeling of hopelessness. The diagnosis of despair is a difficult and elusive one, and we must listen attentively with 'the third ear' to tune it in. . ."

Behavior Disorders in Children, Ruth W. Baldwin, MD 68

"In the past 20 years, especially in the last five years, much has been written about organic behavior disorders or brain damaged children under some 38 different terms, such as, Minimal Brain Damage, Minimal Brain Dysfunction, Brain Injury, Brain Damage, Hyperkinetic Syndrome, and Percentually Handicapped. Behavior problems, formerly considered emotional ones, are now being recognized as organic in origin. . . . Treatment must be three-prong—medical management with various medications, counselling, and educational planning."

The Adolescent Turmoil, Ghislaine D. Godenne, MD 72

". . . For sake of clarity, one should first define the limits of the adolescent period. Adolescence is a period of life ranging from puberty to adulthood. Although the age of puberty is relatively easy to determine, the one of adulthood is rather vague: one can set it at 18, 21 or 25, 45!—never! Arbitrarily, at The Johns Hopkins Adolescent Clinic, we have set the upper limit of adolescence to 21 years of age—the age at which an adolescent becomes legally independent from its parents. . . ."

Grief and Depression in Old People, Robert D. Patterson, MD 75

"Grief and depression occur to people at all times through their lives, but these conditions are special problems for old age. Much can be done to ease the pain of depression and help people complete their grieving."

Some Medical and Sociological Problems of the Urban Community, M. Alfred Haynes, MD 80

"The major health problems of our cities are essentially the health problems of the poor. The cities contain a large percentage of the rich, but they also contain 54% of the poor. Many of the latter are black, and although the majority of the poor in America are white, the nonwhite are twice as likely to be poor as the white. . . . It is unfortunate to be poor, but to be poor and black is to carry a tremendous burden of increased morbidity and mortality. This is the group which forms the heart of our cities."

Will everyone get his fair share?

Uncle Sam doesn't really want more than his share. But he often gets it when someone neglects to make a will. Or when a trust officer and lawyer have never been consulted about the many ways estate taxes may be minimized under today's complicated tax and inheritance laws.

Maryland National's Trust Department is widely experienced in all phases of creating and administering trusts. And we have an investment performance record we'll proudly compare with any other.

So talk with your lawyer. Then talk with us. Just call 685-3900 and ask for Jack Boadway. He and your lawy will help make sure that what you've worked so hard for will keep right or working hard, and that your heirs wi get their fair, and full, shares.

TAX REFORM AND PROFESSIONAL CORPORATIONS

The Tax Reform bill now before Congress seems to have put a crimp in the trend toward formation of professional corporations. If the tax reform bill is passed as it now reads, professionals who elect to file tax returns under Subchapter S of the IRS laws will not be permitted to deduct expenses for retirement programs that exceed the present Keogh limitations.

However, the Faculty's Med-Chi Insurance Trust is now investigating the possibilities for tax advantageous retirement programs for Professional Corporations not electing Subchapter S treatment. An initial legal opinion from a nationally known tax attorney indicates distinct advantages, even for the solo practitioner, in a corporate structure for his practice of medicine.

Be on the lookout for details of this proposal, scheduled to be made available to members within the near future -- in sufficient time for incorporation in the current year.

LICENSE REVOCATION

The license of Alfred L. Cole, MD, Baltimore, has been suspended for a 60-day period, effective June 30, 1969.

NATIONAL HEALTH SHOW

The National Health Show has been booked into Baltimore's Civic Center from December 4 to December 14, 1969. Full details will be made available to interested parties at a later date.

1970 SCIENTIFIC EXHIBITS

Space is still available for Scientific Exhibits at the Faculty's 1970 Annual Meeting, April 1, 2, 3, being held at The Alcazar. Application forms may be obtained through the Faculty office.

SUMMER RESEARCH PROGRAM

The Faculty's Delegates to the American Medical Association House of Delegates were interviewed during the AMA House meeting in July by medical students from both The Johns Hopkins University School of Medicine and the University of Maryland

SUMMER RESEARCH PROGRAM (cont'd)

The two students, supported by a grant from the U.S. Department of HEW and OEO, were investigating all aspects of the field of medicine other than scientifi ie, socioeconomic, etc. Following the AMA session, both individuals were assigned to a preceptorship with a U.S. Senator or Congressman, newspaper or some other public activity for the remainder of the summer.

CHILD ABUSE COMMITTEE

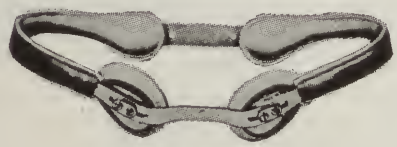
The State Department of Social Services has reactivited its Advisory Committee on Child Abuse. The Committee was originally established following legislation involving the reporting of suspected child abuse cases with its purpose that of implementation of the legislation. The reactivation of the group is to consider the question of whether the legislation has accomplished its purpose and whether further educational or legislative action is needed.

PROFESSIONAL INCORPORATION FORUM

A Forum on Professional Incorporation is scheduled for Thursday, October 16, at the Statler-Hilton Hotel, Baltimore, from 9:30 a.m. through 4:30 p.m.

Arnold Streich, LL.B., Director, Corporate Law Department of the AMA will be one of the speakers. Registration, including lunch, is $30 per person and may be made through application to the Faculty office.

1970 STATE LEGISLATION



Proposals up for consideration for possible introductio into the 1970 State General Assembly include broadeni of the provisions of the present Parental Consent legislation. The change would authorize physicians to treat, on a psychiatric basis, those students who are over age 18 without obtaining consent of their parents. In addition, discussions are taking place with respect to proposed nurse-midwife licensure; licensure for radiologic technologists, nursing home administrators, and others.

Sex Education of Children and Youth

Currently, there is much discussion and debate about sex education of our young people and, particularly, with respect to sex education in schools. Accordingly, it seems advisable at this time to review the American Medical Association's position supporting sex education for children and youth.

In 1960 at the Annual Convention in Miami Beach, the House of Delegates of the American Medical Association adopted a general resolution on health education in schools and colleges. The resolution reaffirmed "the American Medical Association's long-standing and fundamental belief that health education should be an integral and basic part of school and college curriculums and that state and local medical societies be encouraged to work with the appropriate health and education officials and agencies in their communities to achieve this end." Sex education is generally considered as one aspect of health education.

In 1965 at the Annual Convention in New York City, the House of Delegates of the American Medical Association accepted a progress report of the AMA Committee on Maternal and Child Care on the problems of unwed parents. In this report, the Committee set forth its conviction that "the physician can contribute significantly to preventive aspects of illegitimacy by counseling young patients on sexual attitudes and behavior," and reiterated the position of the AMA's Joint Committee on Health Problems in Education with the National Education Association, regarding 'the school's responsibility to supplement the home and other community agencies in teaching the facts about reproduction, the nature of the sexual drive, and the values inherent in our family system."

Previously, in 1964, the Joint Committee on Health Problems in Education had adopted a resolution delineating this concept and urging schools to ". . . accept appropriate responsibility for reinforcing the efforts of parents to transmit knowledge about the values inherent in our family system, and about the psychic, moral, and physical consequences of sexual behavior . . . that this be done by including in the general and health education curriculum the physiology and biology of human reproduction beginning at the elementary level and continuing throughout the school years at increasing levels of comprehension, and . . . that the concept of the family as a unit of society based on mature, responsible love be a continuing and pervasive educational goal." A year later, the Joint Committee supplemented its 1964 resolution with another resolution pertaining to the role of the physician in sex education recommending ". . . increased emphasis in medical schools and continuing education programs to orient physicians in the area of sexual attitudes and behavior. . . ."

The AMA Committee on Human Reproduction during its deliberations became convinced that improved public, as well as, professional education is an essential ingredient to meeting today's issues concerned with human sexuality. In this regard, the Committee recommended in 1964 that "the AMA take the responsibility for disseminating information on all phases of human reproduction, including sexual behavior, by whatever means are appropriate within the resources of the Association." In 1968, the Committee also recommended that the "AMA provide source material and educational opportunities for school and community health educators to improve their understanding and knowledge regarding human sexuality and family life education."

At its Annual Convention in San Francisco in 1968, the House of Delegates of the American Medical Association approved a number of recommendations concerned with the reduction of infant mortality in the United States. Among these recommendations was one dealing with education as follows: "The American Medical Association should inaugurate and support programs of health education, including good maternal and child health practices, family life and sex education, and the appropriate use of health care resources."

In 1968, a special ad hoc committee of the Board of Trustees of the American Medical Association studied needs in the area of human reproduction. As a result of its deliberations, this Committee reported a series of recommendations about medical school and continuing education programs designed to "assist the physician in dealing with problems of

sexuality in medical practice and in his role as a counselor in family life education." In the same report, the Committee also made a series of recommendations encouraging: ". . . the teaching of human sexuality as a basic aspect of health education in schools and colleges," and the ". . . preparation of teachers properly equipped to handle sex education as a significant aspect of health education." These recommendations were approved by the Board of Trustees in December 1968.

In AMA deliberations relating to sex education, there has been a continuing emphasis on a number of guiding principles that are considered basic to education in this area. Included among these are the concepts that: (1) the basic responsibility for sex education belongs to the home, but the church, school, and some other community agencies have a supplementary role in reinforcing and supporting the efforts of the home; (2) that involvement of broad representation from the community in both the planning and conducting of sex education in schools is essential to acceptable inclusion of this sensitive area in the health education curriculum; (3) that the physician, with a sensitivity to the need for counseling in sex education, can contribute significantly to education of his patients in this area; (4) that those persons involved in supporting the efforts of the home through sex education in churches, schools, and other appropriate agencies must be exemplary individuals who are carefully selected and properly prepared for this important responsibility; (5) that sex education in the schools should be an integral and important aspect of the over-all health education program and not a separate course, project, or program; and (6) that materials of instruction used in sex education must be carefully selected with respect to school and child level placement, general and educational suitability, physiological and psychological accuracy, and appropriateness, and community acceptance in terms of local conditions, customs, and traditions.

The American Medical Association and many other national agencies and organizations concur with respect to sex education for children and youth. Below are listed some of the national groups which have made statements or issued supporting documents on the matter.

American Academy of Pediatrics

American Association for Health, Physical Education, and Recreation

American College of Obstetricians and Gynecologists (Committee on Maternal Health)

American Public Health Association (Governing Council)

American School Health Association

Interfaith Commission on Marriage and Family Life (Synagogue Council of America, U.S. Catholic Conference, National Council of Churches)

National Congress of Parents and Teachers

National School Boards Association and American Association of School Administrators (Joint Committee)

National Student Assembly of the YMCA and the YWCA

Sixth White House Conference on Children and Youth

United Nations Education, Scientific, and Cultural Organization

United States Department of Health, Education, and Welfare (Commissioner of Education)

For a number of years, the Joint Committee on Health Problems in Education has published, and made available at cost, a series of booklets on sex education for children of various ages and their parents. Inquiries to: AMA, 535 North Dearborn Street, Chicago, Illinois 60610 (Box #10).

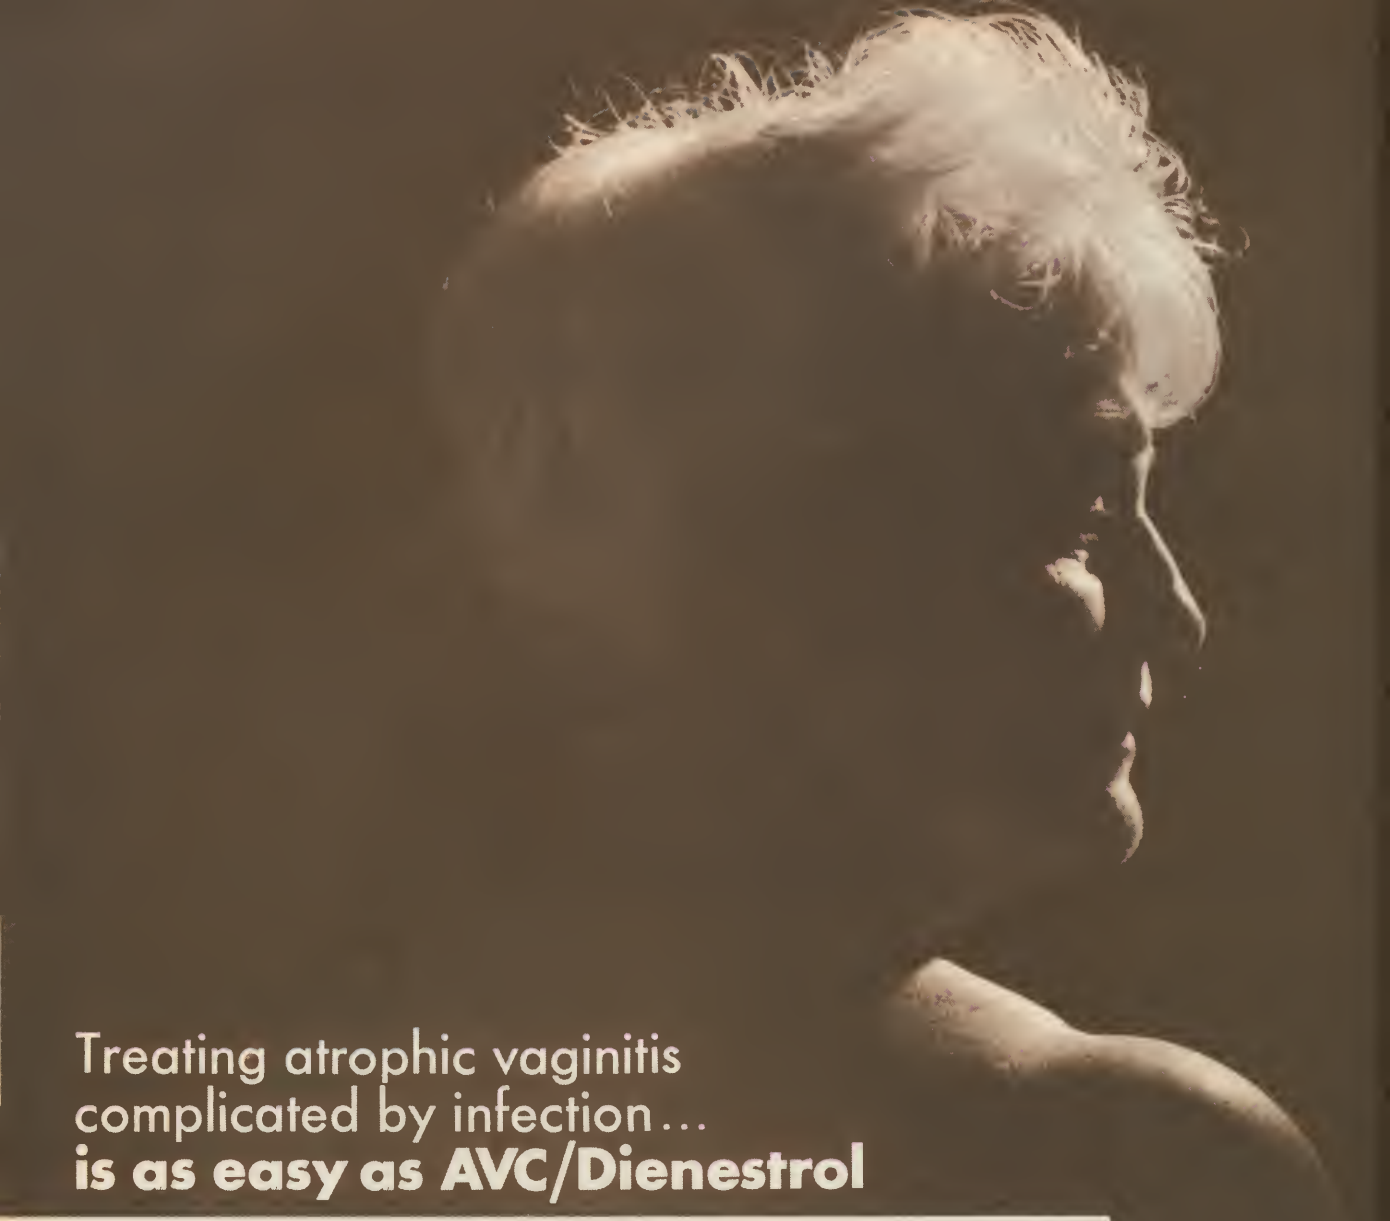
Painful night leg cramps...

unwelcome bedfellow for any patient– including those with arthritis, diabetes or PVD

One thing patients can sleep without, particularly patients with chronic disease conditions such as arthritis, diabetes or PVD, is painful night leg cramps. Although seldom the presenting complaint, night leg cramps can tie your patients up in painful knots. Now, just one tablet of QUINAMM at bedtime can usually bring an end to shattered sleep and needless suffering. Your patients will sleep restfully—gratefully—with QUINAMM, specific therapy to prevent painful night leg cramps.



Prescribing Information—Composition: Each white, beveled, compressed tablet contains: Quinine sulfate, 260 mg., Aminophylline, 195 mg. **Indications:** For the prevention and treatment of nocturnal and recumbency leg muscle cramps, including those associated with arthritis, diabetes, varicose veins, thrombophlebitis, arteriosclerosis and static foot deformities. **Contraindications:** QUINAMM is contraindicated in pregnancy because of its quinine content. **Precautions/Adverse Reactions:** Aminophylline may produce intestinal cramps in some instances, and quinine may produce symptoms of cinchonism, such as tinnitus, dizziness, and gastrointestinal disturbance. Discontinue use if ringing in the ears, deafness, skin rash, or visual disturbances occur. **Dosage:** One tablet upon retiring. Where necessary, dosage may be increased to one tablet following the evening meal and one tablet upon retiring. **Supplied:** Bottles of 100 and 500 tablets.

Specific therapy for night leg cramps

Q915A 1/70

Treating atrophic vaginitis complicated by infection... **is as easy as AVC/Dienestrol**

Dienestrol helps restore estrogen-deficient vaginal mucosa.
It is the *particular* ingredient in AVC/Dienestrol that improves cell maturation counts[1,2] — helps stimulate the restoration of normal vaginal epithelium to resist infection.

Two recent studies reconfirm AVC/Dienestrol efficacy.[1,2] AVC/Dienestrol is proven effective against monilial, trichomonal, nonspecific bacterial vaginitis, and mixed infections.[1,2] AVC/Dienestrol combats infection, helps restore tissue resistance to reinfection.

So even in complex cases, the treatment can remain the same. Comprehensive. Effective. Easy as AVC/D.

Contraindications: Known sensitivity to sulfonomides; diognosis or fomiliol history of corcinomo of the genitol troct or breosts; precorcinomatous lesions of the vogino or vulvo; polpoble uterine fibromyomo; mommary fibroodenomo; depressed liver function.

Precautions/Adverse Reactions: The usuol precoutions for topicol ond systemic sulfonomides should be observed becouse of the possibility of obsorption. Burning, increosed tocol discomfort, skin rosh, urticoria or other monifestotians of sulfonomide toxicity or sensitivity ore reosons to discontinue treatment. The use of AVC/Dienestrol does not preclude the necessity for coreful diognostic meosures to eliminote the possibility of neoplosio of the vulvo or vagina. Monifestations of excessive estrogenic stimulotion through dienestrol obsorption moy occur. These include uterine bleeding, breost tenderness, exocerbotion of menstruol irregulority and provocation of serious bleeding in women sterilized becouse of endometriosis. Endometriol withdrowol bleeding moy occur if use is suddenly discontinued.

Dosage: One opplicotorful or one suppository introvoginolly once or twice doily.

Supplied: 'AVC/Dienestrol Creom'—Four ounce tube *with* opplicotor. 'AVC' ond 'AVC/Dienestrol Suppositories'—Box of 12 *with* opplicotor.

ANNOUNCING THAT

The GUNDRY SANITARIUM

*Established 1900 * * * Continually Growing and Modernizing*

(1) . . . HAS BEEN ACCREDITED FOR 3 YEARS BY THE JOINT COMMISSION ON ACCREDITATION OF HOSPITALS

(2) . . . HAS BEEN CERTIFIED AS A PARTICIPATING HOSPITAL FOR HEALTH INSURANCE UNDER SOCIAL SECURITY (MEDICARE)

The GUNDRY SANITARIUM, a complete psychiatric community, includes a 33-bed Inpatient Hospital for female patients, a Night Hospital for female patients, a Day Hospital for male and female patients, and an Outpatient Department for patients of all ages.

Wouldn't you feel satisfied knowing that your patient is receiving care in a hospital with all these advantages:

- **Treatment is based upon intensive individual and group psychotherapy combined with drug therapy when indicated**
- **All the Doctors are highly trained Psychiatrists**
- **Highly trained Nursing and Medical staff is available 24 hours a day**
- **Environment is warm and homelike.**
- **Protected against fire by approved sprinkler system**
- **Competent medical consultation in all fields is available**
- **Close liaison with the referring physician is maintained**
- **All forms of occupational and recreational activities are offered**
- **Follow-up care in the Day, Night or Outpatient Service**
- **RATES are reasonable; outpatient fees on a sliding scale.**

Book Reviews

PHYSICAL DIAGNOSIS: THE HISTORY AND EXAMINATION OF THE PATIENT, Prior and Silberstein; Third Edition, The C. V. Mosby Company, St. Louis, 1969.

The authors of this book add a new dimension to their subject—approached from a physiological standpoint—by rooting it in the philosophy that physical diagnosis should be meaningful and practical. It should not be a mere mechanical process, or treated so by the physician or the patient.

Therefore, one of the main objectives of this book is to teach the student how to obtain an adequate history, along with helping him to become a physician. Explanation of medical terminology and discussion of disease is accomplished with simplicity and brevity in order to prevent the student from being overwhelmed by a wealth of material.

So, if you are in need of a textbook on this subject, we highly recommend it.

TOP WATERFOWL GUNNING

CHOPTANK RIVER FARM

83 acres with ½ mile shoreline, sandy beach, deep anchorage: includes small year round house.

Close to Easton, this is a good value at $125,000.

ATLAS OF NUCLEAR MEDICINE: VOLUME ONE, BRAIN, DeLand and Wagner; W. B. Saunders Co., Philadelphia, 1969.

This book literally illustrates one of the most popular procedures in nuclear medicine—the brain scan. By mapping out the distribution of radioactivity within the body, the book shows how various diseases can be detected and localized, eg, cerebral infarcts and hemorrhages, and tumors. Needless to say, one can see the value of this technique in diagnosing diseases.

Nevertheless, the authors do not let the reader take the obvious for granted in their explanation of brain scanning. They substantiate the invaluable use of this method by including numerous pictures of brain scans, accompanied by short studies on each one, consisting of a clinical history, a prior diagnosis, a description of the scan, an interpretation, the subsequent course, and the final diagnosis. In almost every case, the results of the brain scan indicate a prior misdiagnosis.

In conclusion, the book affords the reader a clear and concise understanding and appreciation of the importance of brain scanning, and will be of great interest to anyone connected with this specialty.

Now When You Recommend Moist Heat,

Recommend Automatic Moist Heat.

Until now, application of moist heat required boiling water, hot towels, and somebody to apply them. The Battle Creek THERMOPHORE changes all that. It provides instant and automatic moist heat, intensely hot, deeply penetrating.

The patient simply plugs it into an outlet. This unique hot fomentation pad then generates its own moisture from the air. Intensely hot moist heat is constantly maintained, and evenly distributed throughout the pad. No water is needed, no filling or emptying is required.

Large 13" x 27" pad covers back, or chest and abdomen, or both legs. Safety thermostat turns it off automatically, prevents overheating.

Price is **$35.00.** Also available in medium size 13 x 13 **$25.00.**

HIGHLAND HOSPITAL

ASHEVILLE, NORTH CAROLINA
Founded 1904

A DIVISION OF THE DEPARTMENT OF PSYCHIATRY OF DUKE UNIVERSITY

Accredited by the Joint Commission on Accreditation and Certified for Medicare

Complete facilities for evaluation and intensive treatment of psychiatric patients, including individual psychotherapy, group therapy, psychodrama, electro-convulsive therapy, Indoklon convulsive therapy, drugs, social services work with families, family therapy, and an extensive and well organized activities program, including occupational therapy, art therapy, music therapy, athletic activities and games, recreational activities and outings. The treatment program of each patient is carefully supervised in order that the therapeutic needs of each patient may be realized.
High school facilities for a limited number of appropriate patients are now available on grounds. The School Program is fully integrated into the hospital treatment program and is accredited through the Asheville School System.
Complete modern facilities with 85 acres of landscaped and wooded grounds in the city of Asheville.

Butisol SODIUM®
(SODIUM BUTABARBITAL)

the "daytime sedative" for everyday situational stress

When stress is situational—environmental pressure, worry over illness—the treatment often calls for an anxiety-allaying agent which has a prompt and predictable calming action and is remarkably well tolerated. BUTISOL SODIUM (sodium butabarbital) meets this therapeutic need.

After 30 years of clinical use . . . still a first choice among many physicians for dependability, safety and economy in mild to moderate anxiety.

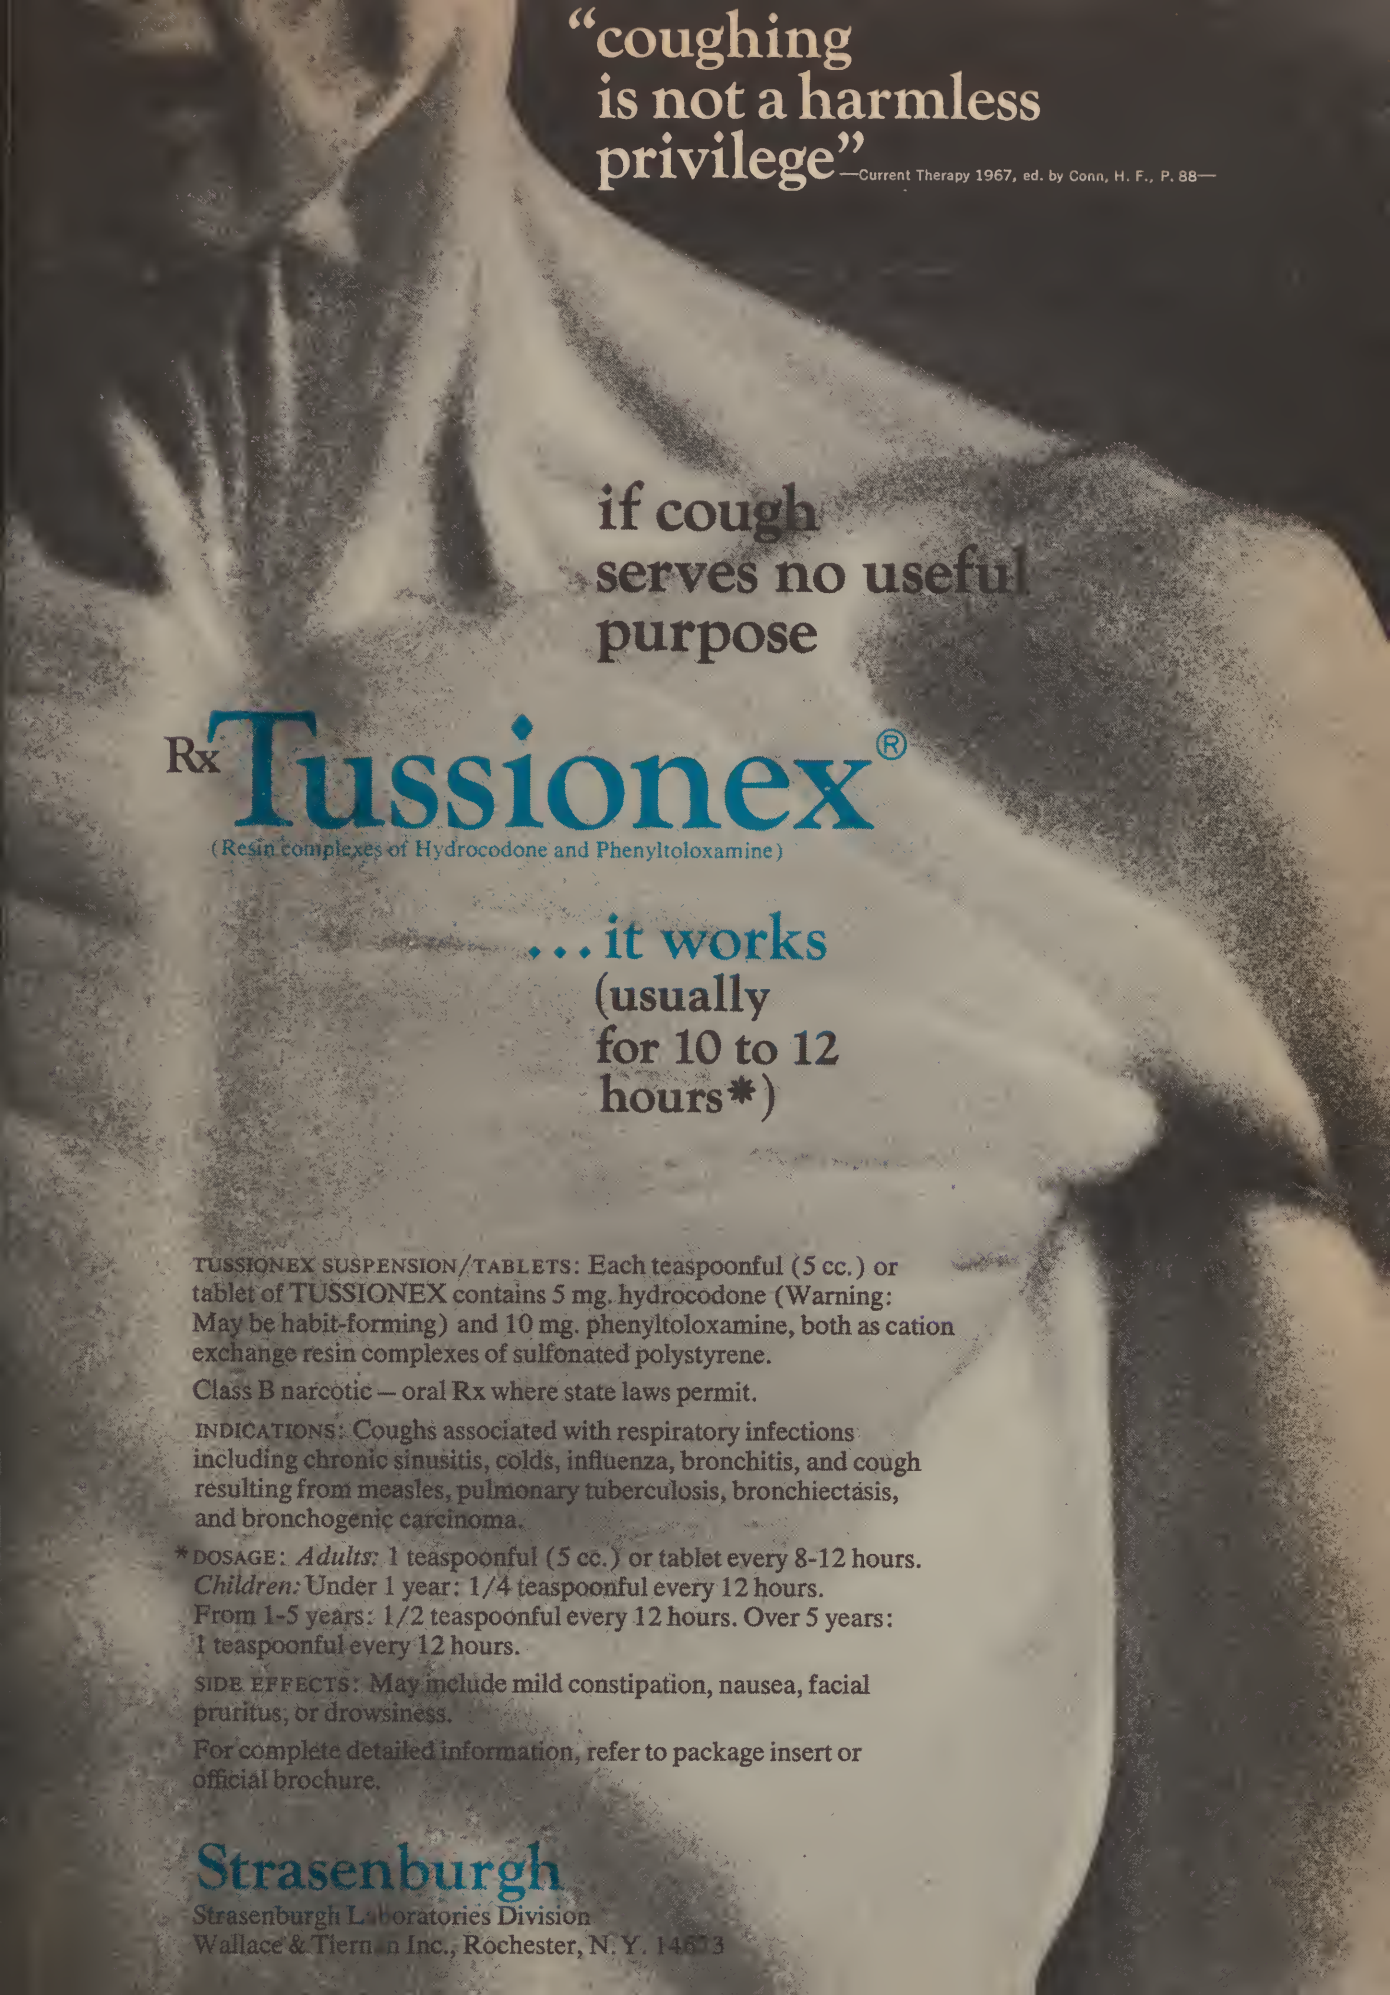
Contraindications: Porphyria or sensitivity to barbiturates.

Precautions: Exercise caution in moderate to severe hepatic disease. Elderly or debilitated patients may react with marked excitement or depression.

Adverse Reactions: Drowsiness at daytime sedative dose levels, skin rashes, "hangover" and systemic disturbances are seldom seen.

Warning: May be habit forming.

Usual Adult Dosage: As a daytime sedative, 15 mg. (¼ gr.) to 30 mg. (½ gr.) t.i.d. or q.i.d.



Available for daytime sedation: Tablets, 15 mg. (¼ gr.), 30 mg. (½ gr.); Elixir, 30 mg. per 5 cc. (alcohol 7%).

BUTICAPS® [Capsules BUTISOL SODIUM (sodium butabarbital)] 15 mg. (¼ gr.), 30 mg. (½ gr.).

McNEIL

McNeil Laboratories, Inc., Fort Washington, Pa.

TUSSIONEX SUSPENSION/TABLETS: Each teaspoonful (5 cc.) or tablet of TUSSIONEX contains 5 mg. hydrocodone (Warning: May be habit-forming) and 10 mg. phenyltoloxamine, both as cation exchange resin complexes of sulfonated polystyrene.

Class B narcotic — oral Rx where state laws permit.

INDICATIONS: Coughs associated with respiratory infections including chronic sinusitis, colds, influenza, bronchitis, and cough resulting from measles, pulmonary tuberculosis, bronchiectasis, and bronchogenic carcinoma.

*DOSAGE: *Adults:* 1 teaspoonful (5 cc.) or tablet every 8-12 hours. *Children:* Under 1 year: 1/4 teaspoonful every 12 hours. From 1-5 years: 1/2 teaspoonful every 12 hours. Over 5 years: 1 teaspoonful every 12 hours.

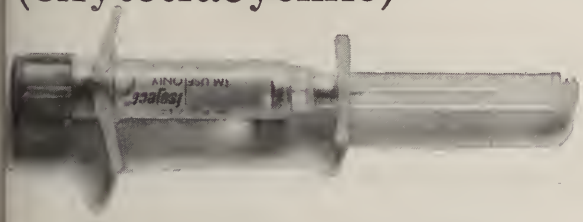
SIDE EFFECTS: May include mild constipation, nausea, facial pruritus, or drowsiness.

For complete detailed information, refer to package insert or official brochure.

Strasenburgh

Strasenburgh Laboratories Division
Wallace & Tiernan Inc., Rochester, N.Y. 14623

No place for beginners



Terramycin®
(oxytetracycline)

Fire victim. Examination reveals second degree burn of lower leg. To combat shock, restore circulatory volume and replace protein loss, plasma is administered. Local pressure dressing applied. Limb elevated to limit the flow of lymph. About 36 hours after admission the patient develops an elevated temperature and complains of pain at the site of the lesion. Dressing removed. A suppurating slough area has developed over part of the burn. A swab specimen is taken for culture and the slough area is debrided. Antibacterial treatment is begun with Terramycin I.M. Days later, recovery is progressing, and the laboratory report shows a mixed infection with a predominance of susceptible coliform bacteria, confirming the therapeutic choice. Terramycin therapy is continued until all signs of infection disappear.

Experience has shown that Terramycin offers special advantages in treating bacterial infections complicating burns, when strains of causative organisms are susceptible. Broad-spectrum antibacterial coverage. Activity unaffected by penicillinase. Rapidly achieved therapeutic blood levels. Proven tissue toleration.

Terramycin I.M. is the only preconstituted broad-spectrum antibiotic designed specifically for intramuscular use. Requires no refrigeration. Remains stable for at least two years. Available for immediate use in Isoject,® a disposable injection unit. In difficult as well as routine cases, when tests reveal susceptible organisms, consider Terramycin. One of the world's most widely used broad-spectrums.

Terramycin® I.M.
(oxytetracycline)

Contraindicated: In individuals hypersensitive to any of the components of this drug.

Warnings: If renal impairment exists, even usual doses may lead to excessive systemic accumulation and possible liver toxicity. In such patients, lower than usual doses are indicated and for prolonged therapy oxytetracycline serum level determinations may be advisable.

Terramycin may form a stable calcium complex in any bone-forming tissue with no serious harmful effects reported thus far in humans.

Use of oxytetracycline during the last trimester of pregnancy, neonatal period and early childhood may cause discoloration of teeth. This effect occurs mostly during long-term use of the drug, but it has also been observed in usual short-treatment courses.

During treatment with tetracyclines, individuals susceptible to photodynamic reactions should avoid direct sunlight. Discontinue therapy at first evidence of skin discomfort.

Note: With oxytetracycline, phototoxicity is not believed to occur and photoallergy is very rare.

Precautions: Use of broad-spectrum antibiotics occasionally may result in overgrowth of nonsusceptible organisms. Where such infections occur, discontinue oxytetracycline and institute specific therapy.

As with all intramuscular preparations, Terramycin Intramuscular Solution should be injected well within the body of a relatively large muscle. *Adults:* The preferred sites are the upper outer quadrant of the buttock (i.e., gluteus maximus), or the mid-lateral thigh. *Children:* It is recommended that intramuscular injections be given preferably in the mid-lateral muscles of the thigh. In infants and small children the periphery of the upper outer quadrant of the gluteal region should be used only when necessary, such as in burn patients, in order to minimize the possibility of damage to the sciatic nerve.

The deltoid area should be used only if well developed such as in certain adults and older children, and then only with caution to avoid radial nerve injury. Intramuscular injections should not be made into the lower and mid-thirds of the upper arm. As with all intramuscular injections, aspiration is necessary to help avoid inadvertent injection into a blood vessel.

Increased intracranial pressure with bulging fontanelles has been observed occasionally in infants receiving therapeutic doses of the drug, but such signs and symptoms have disappeared rapidly on cessation of treatment with no sequelae.

Adverse Reactions: Subcutaneous and fat-layer injection may produce mild pain and induration which may be relieved by an ice pack. Very mild gastrointestinal disturbances, not requiring discontinuance of the drug, may occur occasionally. Allergic reactions, including anaphylaxis, rarely have been observed.

Dosage: *Adult:* The optimal dosage varies, depending on the type and severity of infection. Unless otherwise specified, a dose of 100 mg. every 8 to 12 hours, or a single daily dose of 250 mg. should be adequate for the treatment of most mild or moderately severe infections. In severe infections, 100 mg. every 6 to 8 hours, or 250 mg. every 12 hours may be necessary.

Serum levels obtained by the recommended dosages are comparable to those provided by the oral dosage of 1 to 2 Gm. daily in adults. Antibiotic therapy should be continued for at least 24 to 48 hours after all symptoms and fever have subsided.

In certain diseases specific courses of therapy may be recommended as a general guide. In primary and secondary syphilis for example, the daily administration of 2 Gm. oxytetracycline, orally, in divided doses for two weeks has given good results. In cases of gonococcal infection two intramuscular injections of 250 mg. each, or one intramuscular injection of 250 mg. combined with one gram given orally as a single dose, will usually suffice, but repetition of this therapy will be required in an occasional case.

In the treatment of hemolytic streptococcal infections, therapy should continue for at least 10 days to prevent development of rheumatic fever or glomerulonephritis.

In the treatment of staphylococcal infections indicated surgical procedures should be carried out in all cases.

Pediatric: A dosage of 3 mg./lb./day in two doses has been found satisfactory in the treatment of most mild to moderately severe infections. For more severe infections, higher dosages may be indicated and should be adjusted accordingly.

Terramycin Intramuscular Solution provides maximum absorption and patient toleration with minimal local irritation.

Supply: Terramycin (oxytetracycline) Intramuscular Solution: available in single dose, prescored glass ampules containing 100 or 250 mg. oxytetracycline/2 cc., Isoject® syringes containing 100 or 250 mg. oxytetracycline/2 cc. and 10 cc. multiple dose vials containing 50 mg. oxytetracycline/cc.

THE MONTH

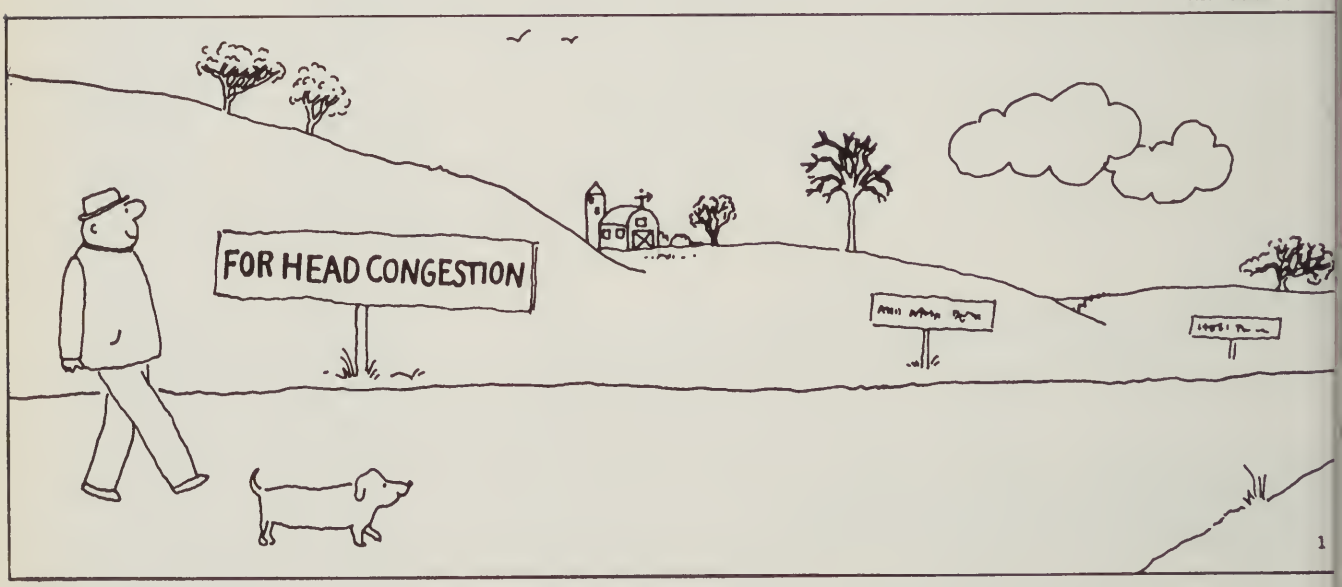
The American Medical Association questioned whether the Department of Health, Education and Welfare has the authority to issue its recent regulation limiting physicians' fees under medicaid.

"We question whether the authority granted by the Congress embraces the promulgation of this regulation," Ernest B. Howard, MD, executive vice president of the AMA, said in a letter to HEW.

"This regulation appears to reverse the roles of state and federal government established in the law itself."

The regulation limits most physicians' fees to the 75th percentile of the customary charge —the maximum customary fee of 75% of the physicians in the area.

After offering HEW the cooperation of the AMA in its efforts to contain rising medicaid costs, Dr. Howard pointed out that the "comprehensive" care goal of the program could not be achieved "without substantial funding, both state and federal."



"Moreover, it has always been recognized that the intent of Title XIX (medicaid), when adopted, was to dissolve any barriers which existed between medical care available to the medically indigent and other citizens," the AMA statement said.

"It also recognized that payment to physicians participating in the government program should be on the basis of reasonable charges, ie, usual charges of the physician within the customary range of charges for similar services in the community, so as to assure a broad range of participation by physicians in the program and eliminate one of the obstacles to the care of patients on the same level as that provided other persons in the community. This was essentially the approach taken in the January 25, 1969, regulations concerning "Reasonable Charges," in which "Customary charges which are reasonable" was established as the upper limit for payment for non-institutional services. We believe that the January 25th pronouncement more accurately comports with the Congressional intent expressed in Section 1903(a)(30) of the Medicaid law, than does the new regulation. . . .

"In departing from this earlier standard, by establishing arbitrary limits on payments to individual practitioners, it should be recognized that the July 1 regulations may again raise a barrier to providing private care to the medically indigent.

"There can be no question that any fee abuses in the program, whether by individual practitioners or other providers, must be ferreted out and eliminated. On the other hand, the true effect of the proposed regulations must be kept in proper perspective, since physicians' fees represent only approximately 11% of the costs of the Medicaid program. Consequently, if the basic concern is with the total costs of the program, the remedy

Advertisement

IN WASHINGTON

in our opinion, is not through regulations which restrict physicians' charges."

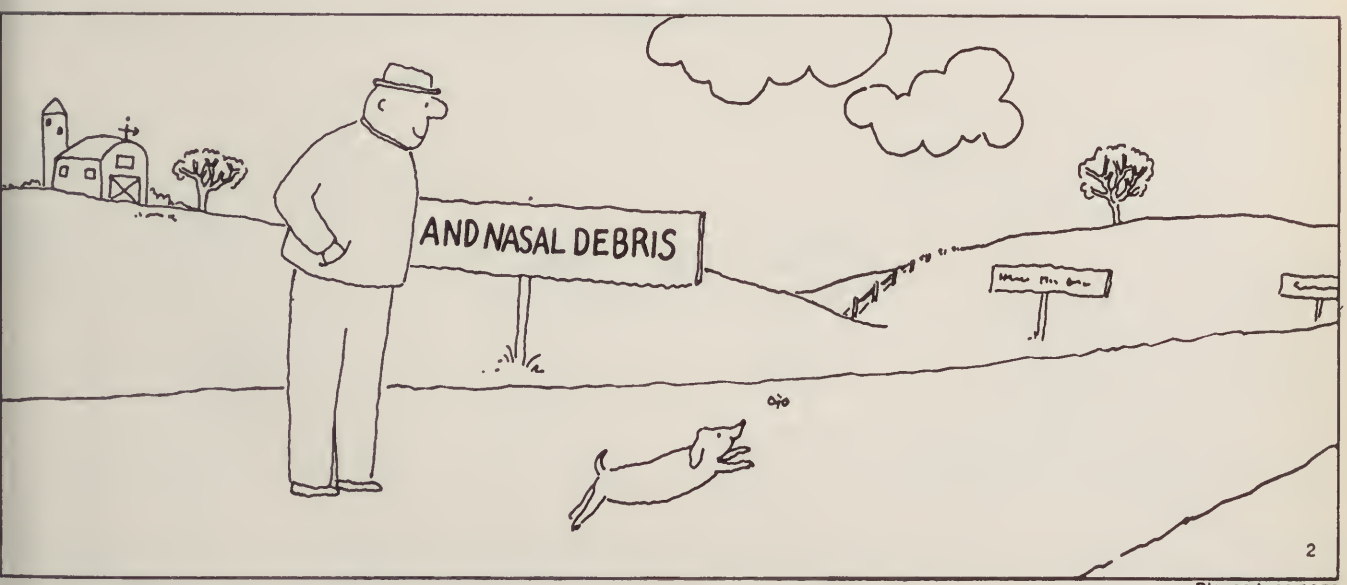
On the Congressional front, the medicaid law was amended to give the states some relief in fiscal difficulties arising from the program.

States now have until July 1, 1977, to submit comprehensive plans of medical care for all needy persons under medicaid. Under the original medicaid law, participating states had to come up with such a plan by July 1, 1975. But rising health care costs resulted in medicaid fiscal difficulties for so many states that Congress delayed the deadline for two years and relaxed other requirements to ease the financial bind.

One of the new amendments permits states to reduce their services under medicaid. In the past, they couldn't. But a state still cannot reduce over-all medicaid spending.

Rep. Wilbur D. Mills (D., Ark.), chairman of the House Ways and Means Committee, said the changes in the law should give states some financial relief and also give Congress time to consider what long-range revisions are desirable in medicaid.

* * *



President Nixon said the nation will be confronted with a "massive" crisis in health care unless government and the private sector cooperates to hold down costs and to improve the system of delivery of medical services.

He made the statement in commenting on Health, Education and Welfare Department's "Report on the Health of the Nation's Health Care System." It carried the names of both HEW Secretary Robert H. Finch and HEW Assistant Secretary for Health and Scientific Affairs Roger O. Egeberg, MD.

"This nation is faced with a breakdown in the delivery of health care, unless immediate concerted action is taken by government and the private sector," the report said. "Expansion of private and public financing for health services has created a demand for services far in excess of the capacity of our health system to respond. The result is a crippling inflation in medical costs causing vast increases in government health expenditures for little return, raising private health insurance premiums and reducing the purchasing power of the health dollar of our citizens."

The report said the medicaid program—"badly conceived and badly organized"—was a major factor in rapidly rising health care costs by attempting "to provide medical services for the poor by pushing them into the nation's already overburdened health care system without developing the capacity in the system to serve them and without building the capability in the states to manage the program."

The report also said overtaxed health resources are being used wastefully and not being expanded rapidly enough. And not

Please turn page

enough attention is being given to preventive health care, the report said.

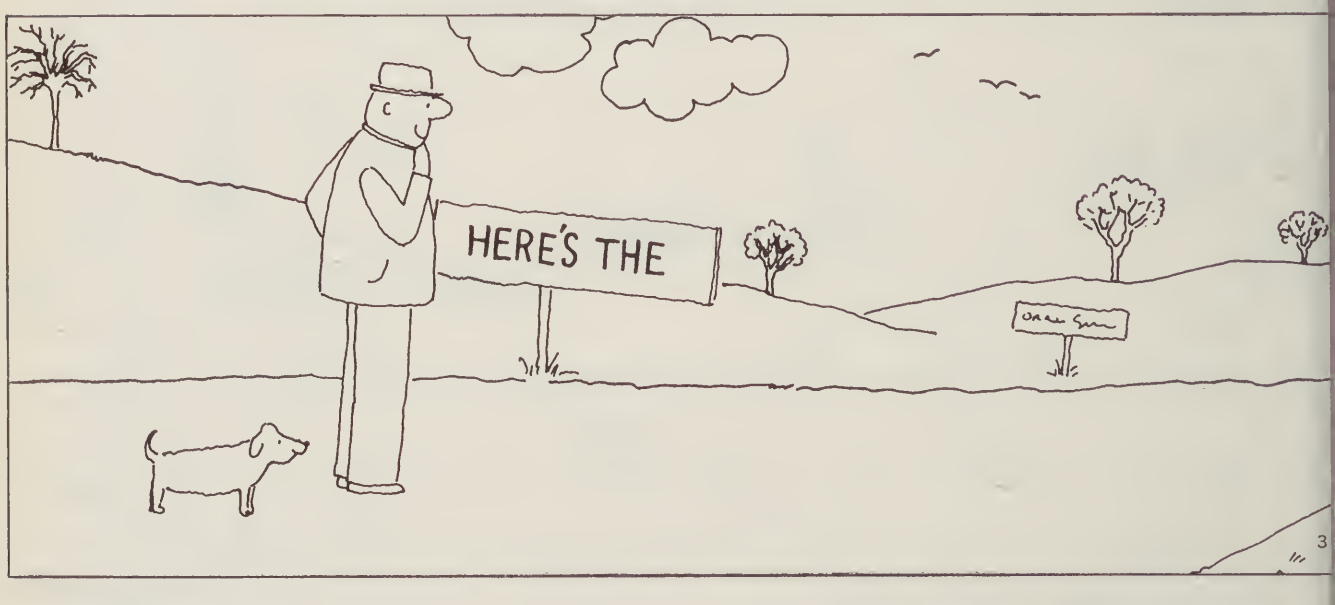
Two advisory groups were set up: a HEW Secretary's Task Force on Medicaid and Related Programs under co-chairmen HEW Undersecretary John G. Veneman and Walter J. McNerney, president of Blue Cross, and a special industry group with David J. Mahoney, president of Norton Simon, Inc., as chairman.

Dwight L. Wilbur, MD, then president of the American Medical Association, congratulated the Nixon Administration for taking "such a thoughtful look at the accumulated problem that has been built up in the past as a result of hurriedly enacted programs, the buildup of unattainable expectations and creation of unsound administrative operations."

"Correcting the consequences of massive disruptions and past political errors will call for the cooperation and dedication in the government and private sectors," Dr. Wilbur said. "This includes physicians, other professionals, many in related fields, hospitals, government, insurance payors and many others."

Dr. Wilbur also welcomed a call by Finch and Dr. Egeberg for discipline through the profession itself of "the very few members of the medical profession who have reportedly abused the (medicare and medicaid) programs."

* * *



Recent testimony by AMA witnesses before Congressional committees included **Dr. O. L. Simenstad,** member of the AMA Board of Trustees, before the Senate Monopoly (Nelson) Subcommittee:

"The advertising policies of the AMA have recognized consistently the uniqueness of drug advertising in that it should not be directed to the public, but to physicians, and because of the public interests involved, it should be responsibly presented. As the drug products in this country have become more sophisticated, the Association's advertising policies have undergone evolution. Initially, an 'ethical' manufacturer was required to disclose the formula of his advertised products. 'Secret nostrums' could not be advertised in responsible medical journals such as JAMA. Today, honest presentation of claims is the primary criterion. . . .

"The policy of the AMA has been to update the advertising standards as the drug field changes. Two of the basic tenets have remained unchanged, however. One is that 'the appearance of advertising in AMA publications is not an AMA guarantee or endorsement of the product or the claims made for the product by the manufacturer, and the other is that advertising space will not be sold unless 'the inclusion of advertising material does not interfere with the purpose of the publication.' "

—Dr. Pierre Salmon, member of the AMA Committee on Aging, before the Senate Long-Term Care Subcommittee:

"We believe that the medical profession should take the lead in organizing 'community coordinating committees' to assume over-all responsibility in coordinating available health facility services in the community. We have suggested that local medical societies invite representatives of the other health agencies and professions in the area to discuss and consider jointly the community's particular problems with regard to long-term care—both convales-

cent and custodial care. Some local medical societies have taken this initiative."

—Dr. Frederick C. Swartz, chairman of the AMA Committee on Aging, before the Senate Subcommittee on Health of the Elderly:

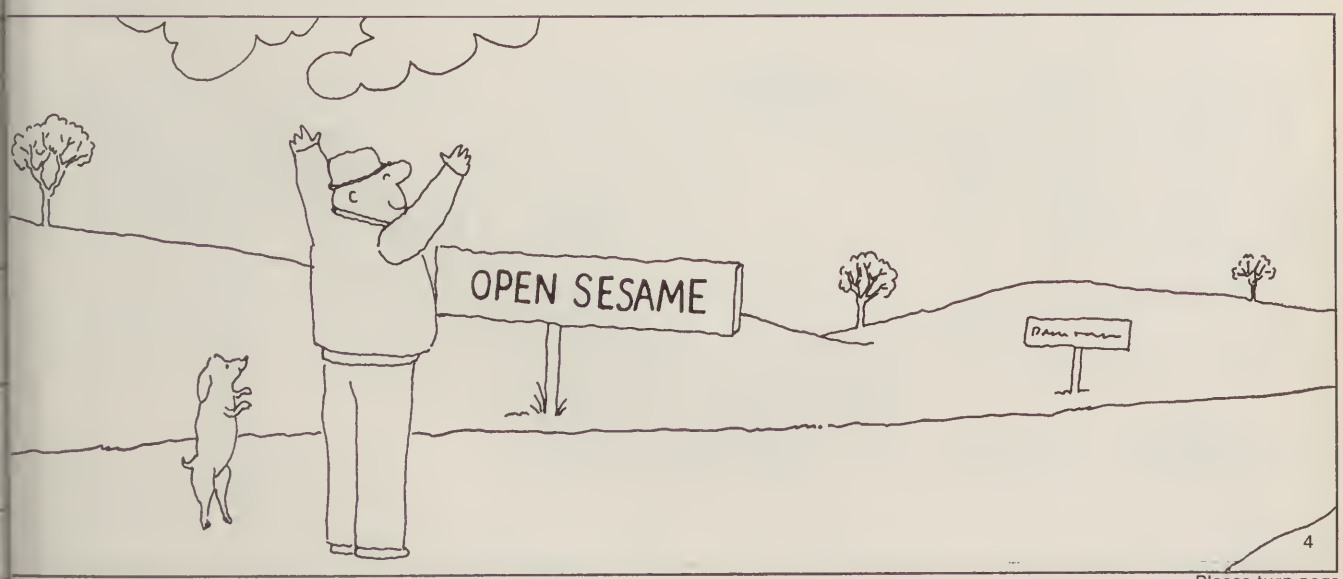
"Age is no bar to good medical or surgical treatment including open heart surgery, so long as the patient presents himself as a reasonably physiologically functioning unit to the physician.

"The medical and paramedical services—the physician and the para-physician personnel—must begin to realize that something can be done for diseases found among the oldsters. The days of condescension medicine to 'grandpap' and 'grandma' is at an end."

—Philip L. White, secretary of the AMA Council on Foods and Nutrition, before the Senate Committee on Nutrition and Human Needs:

". . . the United States needs to develop a national nutrition policy. . . . The development of goals in food production and distribution, the establishment of adequate levels of nutrient intake for individuals and groups of people, plans for the nourishment of our future expanded populations are but a few of the issues which require national attention."

—Dr. Henry Brill, chairman of the AMA Committee on Alcoholism and Drug Dependence, before the House Education Subcommittee:



"In the course of the AMA's work in this field, we have been profoundly impressed by the fundamental importance of public education about narcotic, depressant and stimulant drugs. In the first instance, of course, public information has a decisive impact on public attitudes and opinions, and in the long run this determines public policy. If drug taking for pleasure should ever become socially acceptable in this country and accepted as a harmless pastime, one could confidently predict that control of drug dependence would become impossible."

—Dr. Marvin A. Block, a member of the AMA Committee on Alcohol and Drug Dependence, before the Senate Subcommittee on Alcoholism and Narcotics:

". . . the crying need, aside from that of research and education, is for community facilities to treat and care for the alcoholic patient, who is entitled to the same rights and opportunities for treatment accorded other sick people."

Did You Know?

- Loans for hospitals and medical construction in blighted urban areas, under a special billion-dollar investment program of the life insurance business, is just under $100 million.
- The money available to build medical facilities in urban areas created permanent jobs for 13,000 persons during the program's first 14 months.
- The largest single portion of these health facilities loans went for hospital construction—nearly $67 million.

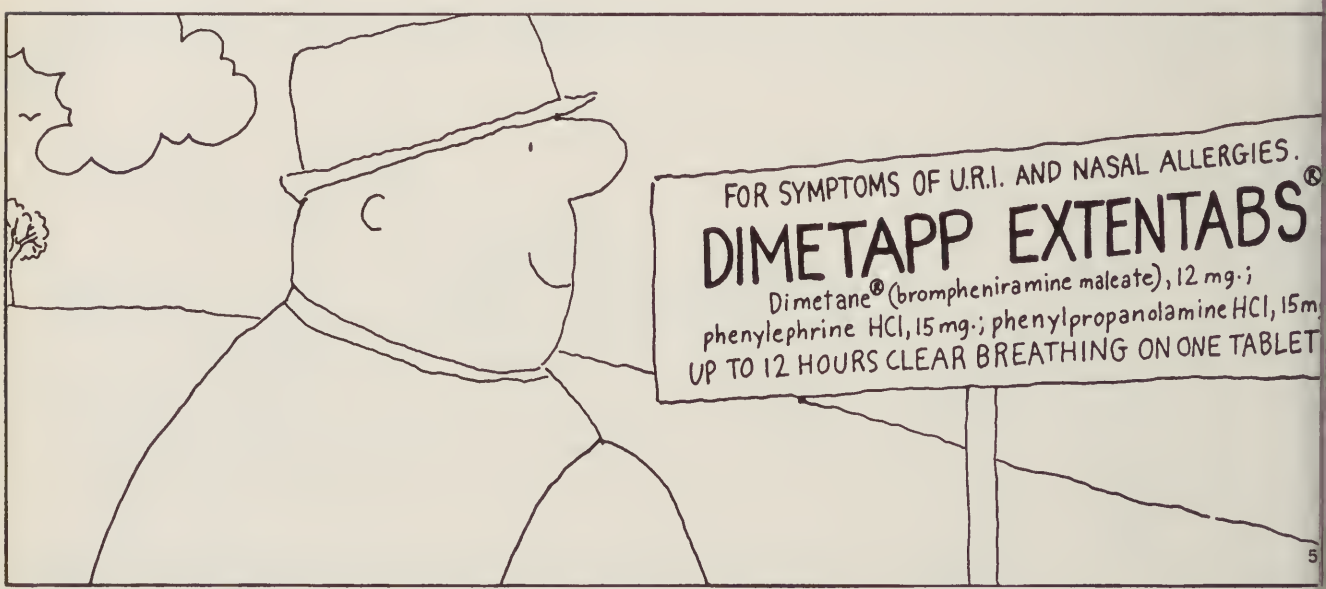
Mental Health Of Urban America

Reviewed In New Report

The paradox of the cities as one of civilization's crowning achievements and most challenging scourges —and what is being done to solve urban mental health problems—are examined in a new report by the National Institute of Mental Health.

"The Mental Health of Urban America—The Urban Programs of the National Institute of Mental Health" is the just published 140-page report.

Giving emphasis to how research, training, and service activities interact in the search for solutions to urban mental health problems, the report cites 240 specific urban projects conducted or supported by the Institute.



Seven out of every ten Americans—or 140 million—live in cities today, the report says, but by 2000 this figure will rise to 80% of the population—or 285 million. Coupled with this rising trend in the urban population is an already disproportionately high urban incidence of mental illness, crime, delinquency, drug abuse, violence, illegitimacy, suicide, alcoholism, and other social problems.

How these special mental health problems of the cities are being tackled is described in the report, covering projects in such areas as riot prevention, prevention and treatment of delinquency, and drugs as an urban problem.

Bringing mental health services to the urban community is the aim of many Institute programs, according to the report. These include activities for the development of community centers, demonstrations in helping slum residents, and neighborhood service programs.

Manpower needs and training to develop various kinds of personnel to combat urban mental health problems are outlined in the report. Descriptions of projects to train entirely new kinds of professional, as well as allied workers emphasize the innovative aspects of manpower development, while programs are also cited for increasing the pool of psychiatrists, psychologists, psychiatric nurses, and mental health social workers.

Single copies of "The Mental Health of Urban America," (PHS Publication No. 1906) are available free from the National Institute of Mental Health. Additional copies are for sale at $1 each by the Superintendent of Documents, U. S. Government Printing Office, Washington, D. C. 20402.

Baltimore Association of Medical Assistants

The Womanly Art of Self-Defense

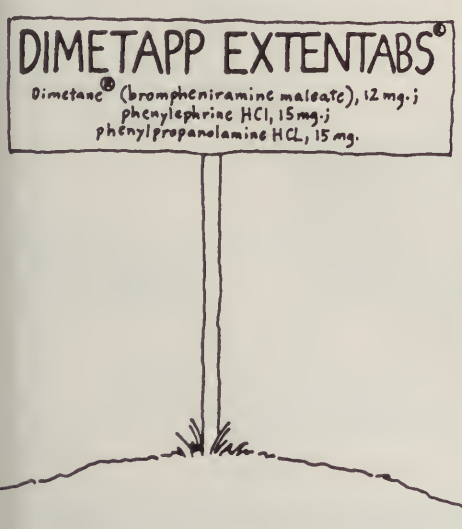
At the monthly meeting of the Baltimore Association of Medical Assistants, held on Tuesday, April 8, at the Deutches Haus, Policewoman Mercedes Rankin of the Community Relations Division, Baltimore City Police Department, was guest speaker.

Her topic, "The Womanly Art of Self-Defense," was illustrated with a film depicting a common assault and robbery of an unprotected woman, and methods of defense against such an attack. Following the film, Policewoman Rankin discussed numerous precautionary and retaliatory methods of protection.

Laboratory Orientation Course

The Baltimore Association of Medical Assistants recently offered a couse in laboratory orientation. Conducted at Drs. Wollenweber and Wright's office and laboratory, 1114 Cathedral Street, the course was held for eight consecutive weeks beginning April 18, 1969, in conjunction with the AAMA certification program. The material covered included: Urinalysis, Hematology, Bacteriology, Immunology, Injections, EKG, Radiology, and Physiotherapy.

Instructors for the course were: Robert H. Wright, MD; Mr. John Komber, ASCP, MT; Mr. Joseph Casino, and Mr. Louis L'Archeveque, MT, ASCP, CSLT.



Mr. L'Archeveque

Annual Bosses' Night

On May 13, 1969, BAMA held its Annual Bosses' Night at the Eastwind Restaurant. The evening was a purely social event.

Following cocktails and dinner, members of the association entertained the guests for the evening with a presentation entitled "Laugh-Out—Smash-In." Members of the cast included John Allen, Peggy Bury, Barbara Daniel, Elva Edmonston, Donna Fedeli, Mary Margaret Frederick, Dorothy Hartel, Bill Leiby, Carmella Sartori, and Catherine Taylor.

(Continued next page)

INDICATIONS: Dimetapp is indicated for symptomatic relief of the allergic manifestations of respiratory illnesses, such as the common cold and bronchial asthma, hayfever and conjunctivitis.

CONTRAINDICATIONS: Hypersensitivity to antihistamines. Not recommended for use during pregnancy.

PRECAUTIONS: Until patient's response has been determined, he should be cautioned against engaging in operations requiring alertness. Administer with care to patients with cardiac or peripheral vascular diseases or hypertension.

SIDE EFFECTS: Hypersensitivity reactions including skin rashes, urticaria, hypotension and thrombocytopenia, have been reported on rare occasions. Drowsiness, lassitude, nausea, giddiness, dryness of the mouth, mydriasis, increased irritability or excitement may be encountered.

DOSAGE: 1 Extentab morning and evening.

SUPPLIED: Bottles of 100 and 500.

A·H·ROBINS A. H. ROBINS COMPANY RICHMOND, VIRGINIA 23220

6

Arrangements for the enjoyable evening were made by Rita Cobry and Dolly Struck. Mrs. Struck and Mrs. Cobry made favors which were presented to each physician in attendance.

Ronald N. Kornblum, MD Guest Speaker in June

At the monthly meeting of the Baltimore Association of Medical Assistants, Ronald N. Kornblum, MD, spoke on "The Green Revolution," which dealt with the problem of drug addiction. During his talk, Dr. Kornblum showed slides of typical "mainliner" methods of heroin addiction and also post-mortem findings in addicts who had taken an overdose of drugs.

He explained many of the hazards of marijuana as well as LSD, and he pointed out that young people seem to be in the majority in drug abuse. Dr. Kornblum's talk was most educational and gave his audience a stark realization of the sadness of drug addiction.

Dr. Ronald N. Kornblum, was born in Chicago, Illinois. He attended the University of California and was graduated in 1955 with a major in Zoology. He then attended the University of California School of Medicine and served his internship at the Great Lakes Naval Hospital. He was General Medical Officer in the U.S. Navy from 1960 to 1962. He served his Pathology residence at Santa Clara County Hospital in California. From 1966 to 1967, he was a resident in Neuropathology at the Central Anatomic Laboratory, and is now in Forensic Pathology at the Medical Examiners Office in Baltimore.

Dr. Kornblum

Two ways to provide your patients with a month's therapeutic supply of Vitamin C:

290 tangerines or 30 Allbee® with C.

Your patient would have to peel and eat 290 tangerines a month, almost 10 every day, to get as much Vitamin C as is contained in just one bottle of 30 Allbee with C capsules (taken one capsule daily). In addition, each capsule provides full therapeutic amounts of the B-complex vitamins. For example, as much niacin as 2 pounds of sirloin steak. This handy bottle of 30 Allbee with C capsules gives your patient a month's supply at a very reasonable cost. Also the economy size of 100. Available at pharmacies on your prescription or recommendation.

Valium® (diazepam) *t.i.d.* and *h.s.*

M. A. (class of '66)... Ph.D. (thesis, in progress)... letters that represent a young lifetime of work... a formal education nearing completion. But there are still long, arduous examinations to pass, a doctoral thesis to finish... a period in which stress is often converted into the gastrointestinal symptoms of psychic tension. For this kind of patient—with no demonstrable pathology—consider the usefulness of Valium (diazepam).

Valium can help relieve psychic tension and resultant somatic symptoms, within the first day for some patients. Valium is also useful in psychic tension with associated depressive symptoms. And Valium can help relieve psychic tension-induced insomnia with an *h.s.* dose added to the *t.i.d.* schedule.

Valium is generally well tolerated. In proper maintenance dosage it seldom dulls the senses or interferes with functioning. Side effects most commonly reported have been drowsiness, fatigue and ataxia.

Before prescribing, please consult complete product information, a summary of which follows:

Indications: Tension and anxiety states; somatic complaints which are concomitants of emotional factors; psychoneurotic states manifested by tension, anxiety, apprehension, fatigue, depressive symptoms or agitation; acute agitation, tremor, delirium tremens and hallucinosis due to acute alcohol withdrawal; adjunctively in skeletal muscle spasm due to reflex spasm to local pathology, spasticity caused by upper motor neuron disorders, athetosis, stiff-man syndrome, convulsive disorders (not for sole therapy).

Contraindicated: Known hypersensitivity to the drug. Children under 6 months of age. Acute narrow angle glaucoma.

Warnings: Not of value in psychotic patients. Caution against hazardous occupations requiring complete mental alertness. When used adjunctively in convulsive disorders, possibility of increase in frequency and/or severity of grand mal seizures may require increased dosage of standard anticonvulsant medication; abrupt withdrawal may be associated with temporary increase in frequency and/or severity of seizures. Advise against simultaneous ingestion of alcohol and other CNS depressants. Withdrawal symptoms have occurred following abrupt discontinuance. Keep addiction-prone individuals under careful surveillance because of their predisposition to habituation and dependence. In pregnancy, lactation or women of childbearing age, weigh potential benefit against possible hazard.

Precautions: If combined with other psychotropics or anticonvulsants, consider carefully pharmacology of agents employed. Usual precautions indicated in patients severely depressed, or with latent depression, or with suicidal tendencies. Observe usual precautions in impaired renal or hepatic function. Limit dosage to smallest effective amount in elderly and debilitated to preclude ataxia or oversedation.

Side Effects: Drowsiness, confusion, diplopia, hypotension, changes in libido, nausea, fatigue, depression, dysarthria, jaundice, skin rash, ataxia, constipation, headache, incontinence, changes in salivation, slurred speech, tremor, vertigo, urinary retention, blurred vision. Paradoxical reactions such as acute hyperexcited states, anxiety, hallucinations, increased muscle spasticity, insomnia, rage, sleep disturbances, stimulation, have been reported; should these occur, discontinue drug. Isolated reports of neutropenia, jaundice; periodic blood counts and liver function tests advisable during long-term therapy.

Valium® (diazepam)

2-mg, 5-mg, 10-mg tablets
to help relieve psychic tension
and its somatic symptoms

"I'm sick of spinning"

When vertigo began, her life took a turn for the worse.
Either she spins and the room stands still,
or the other way around... and around and around.
Even when she lies down, the spinning
continues. Sometimes there's nausea and vomiting, too.
It's just one thing after another.

You can help stop the spin with

BONINE®

(MECLIZINE HCl)

Bonine protects most patients against vertigo and nausea up to 24 hours with a single dose. Pleasant-tasting Bonine tablets are chewable and can be taken anytime, anywhere, without water. In difficult cases, multiple daily doses may be necessary for maximum response.

Precautions: Although the incidence of drowsiness and atropine-like side effects such as dry mouth and blurring of vision is low, the physician should alert the patient to the need for due precautions when engaging in activities where alertness is mandatory. *Use in women of childbearing age:* In weighing potential benefits vs. risk in women of childbearing age, consider the fact that a review of available animal data reveals that meclizine exerts a teratogenic response in the rat. In one study a dose of 50 mg./kg./day (50 times the maximum recommended human dose) produced cleft palate in 2 of 87 fetuses when administered to the rat at critical times during the first 15 days of gestation. At doses of 125 mg./kg./day, meclizine will produce 100% incidence of cleft palate in the rat. At doses of 25 mg./kg./day, decreased calcification of the vertebrae and relative shortening of the limbs were also produced in the rat, but experts disagree as to whether this is a teratogenic response. While available clinical data are inconclusive, scientific experts are of the opinion that this drug may possess a potential for adverse effects on the human fetus. Consequently, consideration should be given to initial use of a nonphenothiazine agent that is not suspected of having a teratogenic potential. In any case, the dosage and duration of treatment should be kept to a minimum.
Supply: 25 mg. scored tablets.
More detailed professional information available on request.

SCIENTIFIC EXHIBITS

The scientific exhibits are an integral part of the Annual Meeting of the Medical and Chirurgical Faculty. All physicians who have a scientific exhibit are urged to fill in the application below for the next Annual Meeting, which will be held

APRIL 1, 2, 3, 1970

The Alcazar, Baltimore

As space is limited, it is suggested that applications be submitted as soon as possible.

RULES GOVERNING SCIENTIFIC EXHIBITS

The following rules govern the selection and conduct of scientific exhibits:

1. Each exhibitor shall be fully responsible for the content, arrangement, presentation, setting up, and dismantling of his exhibit.
2. Cost of transportation of exhibit to and from the meeting must be borne by the exhibitor.
3. The Medical and Chirurgical Faculty will provide, without cost to the exhibitor, a backdrop and side rails for the booth, and 1000 watt electric current outlets.
4. MOTION AND SOUND MAY BE USED ONLY IF THEY DO NOT DETRACT FROM OTHER EXHIBITS, DISTURB THOSE IN ROOM, OR INTERFERE WITH TELEPHONES.
5. No reference to, or credit for, financial aid shall be shown on the exhibit.
6. Only generic names may be used, and shall not exceed one inch in height. NO TRADE NAMES are permissible.
7. Each exhibit should be manned at all times by someone thoroughly familiar with its content.
8. Exhibitors are urged to discuss their displays and work with the physicians and students.
9. The Medical and Chirurgical Faculty reserves the right to approve or reject any exhibit without recourse.

APPLICATION FOR SCIENTIFIC EXHIBIT SPACE

Fill in and mail to: Chairman, Exhibit Subcommittee
Medical and Chirurgical Faculty
1211 Cathedral Street, Baltimore, Md. 21201

1. Title of exhibit: _____

_____

2. Please attach a 50-100 word description of the exhibit: _____

3. Give amount of space required, depth, width, and height: _____

If exhibit has side panels, are depth and width included above? _____

If not, what additional space is required? _____

4. Electrical or other requirements: _____

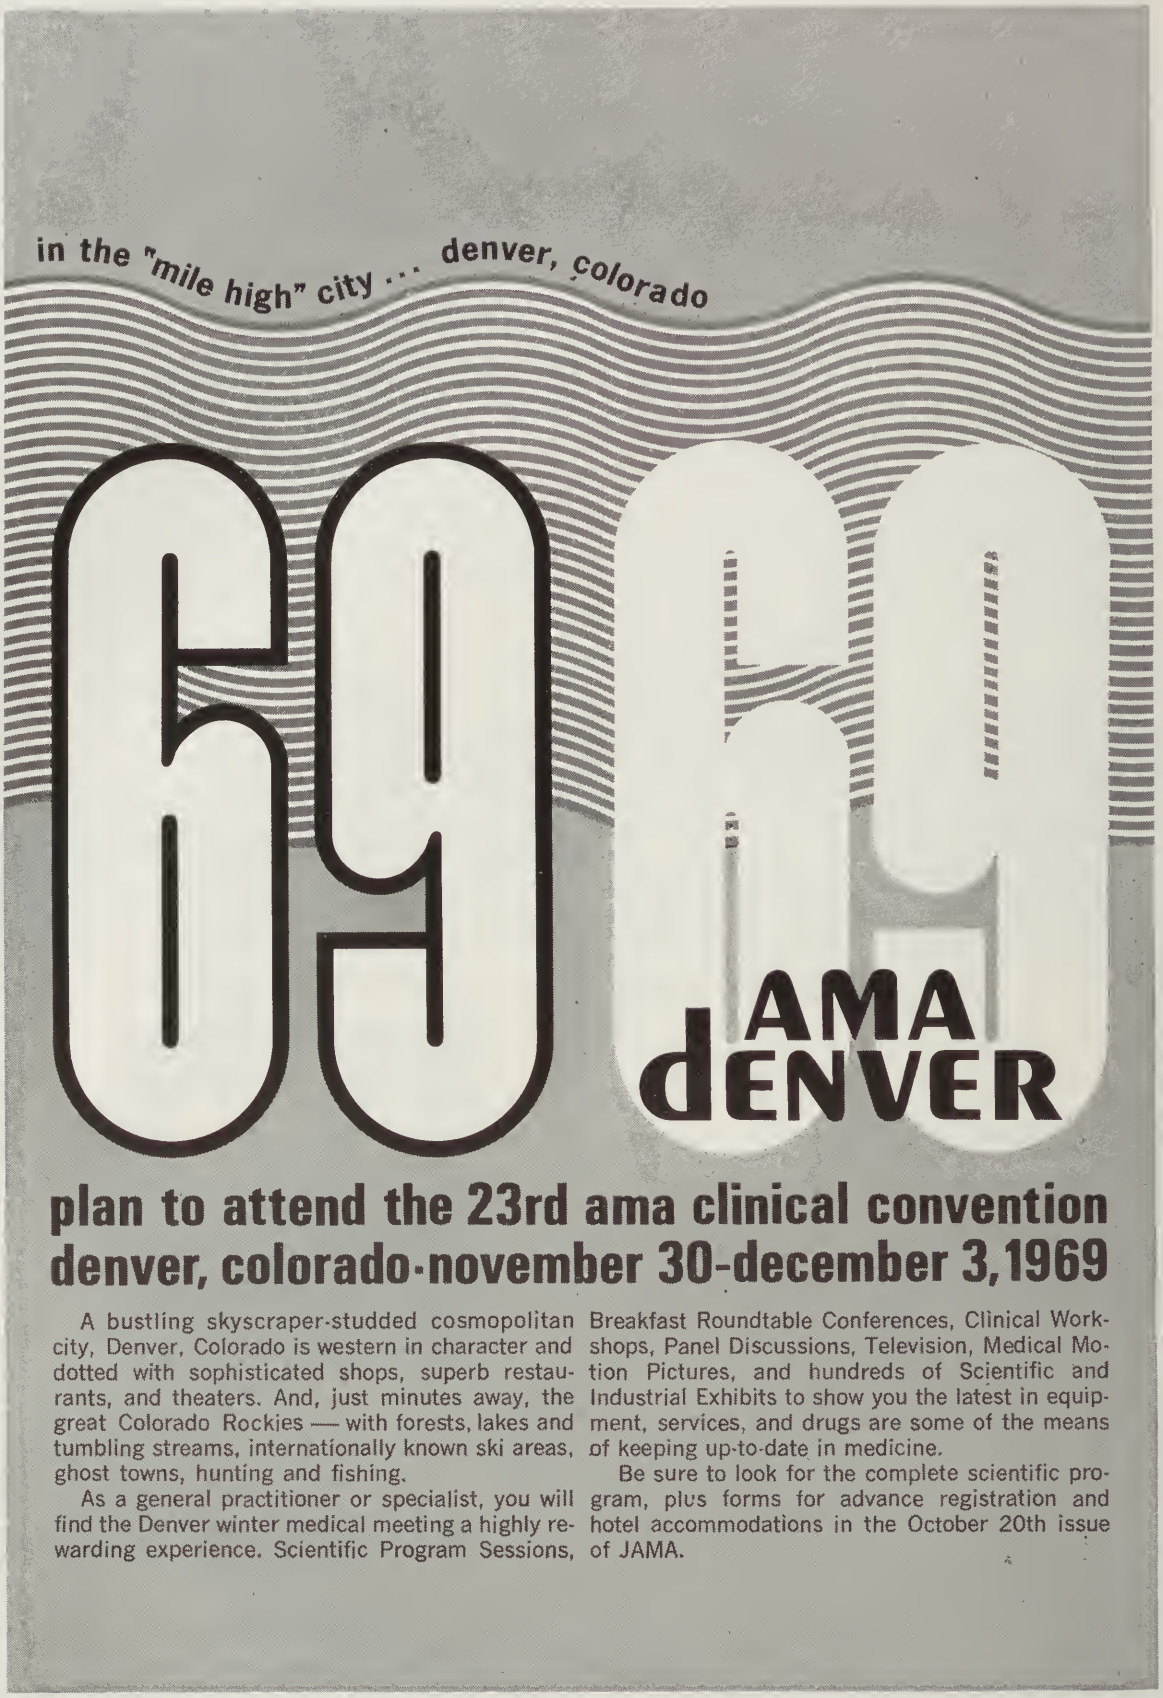
_____

5. Has exhibit been shown at other medical meetings? _____

_____

6. Name and title of exhibitor: _____

_____



7. Name of institution cooperating in the exhibit: _____

_____

8. Address of exhibitor: _____

_____

SEE RULES GOVERNING SCIENTIFIC EXHIBITS

plan to attend the 23rd ama clinical convention denver, colorado-november 30-december 3,1969

A bustling skyscraper-studded cosmopolitan city, Denver, Colorado is western in character and dotted with sophisticated shops, superb restaurants, and theaters. And, just minutes away, the great Colorado Rockies — with forests, lakes and tumbling streams, internationally known ski areas, ghost towns, hunting and fishing.

As a general practitioner or specialist, you will find the Denver winter medical meeting a highly rewarding experience. Scientific Program Sessions, Breakfast Roundtable Conferences, Clinical Workshops, Panel Discussions, Television, Medical Motion Pictures, and hundreds of Scientific and Industrial Exhibits to show you the latest in equipment, services, and drugs are some of the means of keeping up-to-date in medicine.

Be sure to look for the complete scientific program, plus forms for advance registration and hotel accommodations in the October 20th issue of JAMA.

LIST OF INTERPRETERS

The following list of interpreters was compiled by the Woman's Auxiliary of the Medical and Chirurgical Faculty with the help of the Baltimore Council of International Visitors. Classified by language, the list includes the names of physicians who are either foreign born or have acquired fluency in a foreign language, as well as the names of the volunteers to this program.

The purpose of this list is to serve foreign-speaking visitors who seek medical advice from physicians who are not conversant in the visitor's language.

MEDICAL NEWS

In May, a group of Maryland physicians and their wives enjoyed a tour of the Eli Lilly Research Laboratories. Pictured are: Dr. and Mrs. A. Woody, Dr. and Mrs. S. Okutman, Dr. and Mrs. A. Rohrbaugh, Jr., Dr. and Mrs. C. Lee, Dr. and Mrs. Ellis, Dr. and Mrs. F. Jaggers, Dr. and Mrs. M. Edwards, Dr. and Mrs. I. Scher, Dr. and Mrs. C. Crimy, Dr. and Mrs. K. Lutlu, Dr. and Mrs. A. Aleece, Dr. and Mrs. H. Hall, Dr. and Mrs. G. Delgado, Dr. and Mrs. J. Ozaziewski, Dr. and Mrs. A. Estrada, Dr. and Mrs. N. McKay, Dr. and Mrs. R. Hernandez, Dr. and Mrs. S. Barranco, Dr. and Mrs. E. Jacobs, Dr. and Mrs. R. Salas, Dr. and Mrs. G. Palmer, Dr. and Mrs. P. Briscoe, Dr. and Mrs. E. Diaz, Dr. and Mrs. R. Barr, Dr. and Mrs. H. Harbold, Dr. and Mrs. W. Tyson, Dr. and Mrs. A. Siwinski, Dr. and Mrs. E. Cook, Dr. and Mrs. W. Birt, Dr. and Mrs. M. Byerly, Dr. and Mrs. L. Little, Dr. C. Gordon and daughter, Dr. H. Armanas, Dr. H. Ward, Dr. J. Fifer, Dr. P. Chang, Dr. S. Mahallati, Dr. G. Linsao, and Mr. and Mrs. J. M. Levine (Lilly representative).

MAGP Annual Meeting

Leon Berube, MD, out-going President of the Maryland Academy of General Practice; Ed Kowalewski, MD, newly installed President of the American Academy of General Practice, and William Stewart, MD, the new President of the Maryland Chapter posed for an informal photograph during the Maryland Academy's Annual Meeting in Warrenton, Virginia in May. Dr. Kowalewski was MAGP's special guest during the meeting. *(See pages 62 through 82 for some of the talks presented during the scientific sessions.)*

Ed Kowalewski, MD, was the special guest at the Annual Meeting of the Maryland Academy of General Practice, held May 9-11, 1969, in Virginia. Dr. Kowalewski is completing his term as president-elect of the American Academy of General Practice and will become president at the Academy's meeting this month.

At the May meeting, **William Stewart, MD,** was installed as the 21st President of the Maryland Academy of General Practice. A native of Baltimore, Dr. Stewart received his MD degree from The Johns Hopkins University School of Medicine in 1951.

Other officers elected at the Annual Meeting include: President-elect, John Chissell, MD, Baltimore; Vice-Presidents, Daniel Welliver, MD, Westminster; Hugh Ward, MD, Owings Mill; Hans Koetter, MD, Baltimore; Phillip Heu-

man, MD, Bel Air; Directors, Howard N. Weeks, MD, Hagerstown; George B. Patrick, Silver Spring; John B. Umhau, Jr., MD, Chevy Chase; Warren R. Lesch, MD, Bel Air; Frank Thomas, MD, Hancock; John C. Hyle, MD, Baltimore; James P. Jarboe, MD, Great Mills; Harold B. Plummer, MD, Preston; Secretary, G. Overton Himmelwright, MD, Cumberland; Treasurer, Harry L. Knipp, MD, Baltimore; Delegates to AAGP, Archie R. Cohen, MD, Clear Spring; Roy Guyther, MD, Mechanicsville; Alternate Delegates to AAGP, Robert Farr, MD, Chestertown; Leon W. Berube, MD, Mechanicsville; Executive Secretary, Mrs. Dorothy Holman, Baltimore; Editorial Board, William L. Stewart, MD, Leon Berube, MD, Dorothy Holman; Managing Editor —News Bulletin, G. Overton Himmelwright, MD; Publishing Editor, Bernard Sitter, MD.

* * *

A. Golpira, MD, has announced the relocation of his office on Cedar Lane to 3029 Dundalk Avenue, Baltimore, Md. 21222.

* * *

Jerome Sherman, MD, has moved his office to the Oxford House at 6810 Park Heights Avenue. Dr. Sherman specializes in the practice of allergy.

* * *

John B. De Hoff, MD, former director of local health services, has been named Deputy Commissioner of the Baltimore City Health Department. In this post, Dr. De Hoff will help chart the course of public health in Baltimore by assisting in the planning and direction of the total city-wide health program. His work will keep him in close contact with the city's medical profession and health-oriented groups in an effort to bring better health care to all Baltimoreans.

Dr. De Hoff received his BA, MD, and Master of Public Health degrees at The Johns Hopkins University. And by virtue of his life-long residence in Baltimore, and his experience, Dr. De Hoff is considered to be exceedingly well-qualified for his new position.

* * *

Emidio Anthony Bianco, MD, has been appointed Medical Director and Director of Medical Education at St. Agnes Hospital, Baltimore. In his new capacity, Dr. Bianco will be concerned with medical staff affairs, patient care, and direction of the medical education program of St. Agnes Hospital, administered by the Daughters of Charity.

Prior to assuming his post, Dr. Bianco had been the chairman of St. Agnes' Department of Medicine since 1967. He received his MD degree from Georgetown University and served an internship at St. Agnes Hospital. He completed his residency at the University of Maryland Hospital, where he was awarded a fellowship in Medicine.

Dr. Bianco

* * *

Robert R. Holthaus, MD, and William E. Schwartz, MD, announce the opening of their office for the practice of pediatrics at 7112 Darlington Drive (Oakleigh Medical Center) Baltimore, Maryland 21234.

* * *

J. Donald Woodruff, MD, has been added to the list of guest speakers for the District VI Meeting of the American College of Obstetricians and Gynecologists in Saskatoon, Saskatchewan, October 8-11, 1969. Dr. Woodruff is from The Johns Hopkins University School of Medicine.

* * *

William S. Spicer, MD, has been appointed consultant to the Dean of the University of Maryland School of Medicine for health care programs. Dr. Spicer's past experience as coordinator of the Maryland Regional Medical Program and as chairman of the Maryland State Board of Health and Mental Hygiene has enabled him to examine all aspects of health care in Maryland.

Dr. Spicer received his MD from the University of Kansas Medical School, and also trained in internal medicine at the University of Kansas Medical Center and at Fitzsimons Army Hospital.

* * *

The National Pituitary Agency, a University of Maryland-based agency that collects and processes human pituitaries for medical research, has named a new Director, **Salvatore Raiti, MD,** who will arrive here from

England on January 1, 1970. Dr. Raiti is presently senior lecturer in endocrinology at the Institute of Child Health in London.

Marvin Cornblath, MD, professor and head of the department of pediatrics at the University of Maryland School of Medicine, is serving as interim director of the NPA, following the resignation of the present Director, **Milton S. Grossman, MD,** who left to accept a position as chief of pediatrics and adolescent medicine at Mt. Sinai Hospital, Miami Beach, Florida.

* * *

Under the Federal Truth in Lending Act, which became effective July 1, 1969, a physician may be required to disclose, on statements sent to patients, the amount and terms of credit arrangements concerning his fees. Regulations issued under the Act apply not only to finance charges, but also to express agreements for payment of medical fees in more than four installments, either with or without finance charges.

Detailed information on the regulations may be obtained from the nearest Federal Trade Commission office or by mail from the agency's headquarters, Washington, D. C. 20580. The information is contained in a booklet entitled "What You Ought To Know About Truth in Lending Consumer Credit Cost Disclosure," Federal Reserve Regulation Z.

* * *

Elected Chief of the medical staff and chairman of the medical board of Church Home and Hospital is **J. H. Mason Knox, 3rd, MD.** As fifth chief of staff at the 111-year-old institution, he succeeds **James C. Owings, MD,** in both positions. Dr. Owings continues his association with the hospital as a senior staff member.

Dr. Knox, a general surgeon, graduated from Yale in 1934, and received his MD degree from The Johns Hopkins Medical School in 1938. During the second World War, Dr. Knox served with the 4th Auxiliary Surgical Group of the 3rd Army under General George Patton. A captain, he was in charge of a surgical team and earned the Bronze Star.

* * *

Irving H. Canfield, MD, has been appointed Deputy State Health Officer for Harford County by William J. Peeples, MD.

Dr. Canfield received his medical degree from Ohio State University and his Master of Public Health degree from the University of Pittsburgh.

The new Harford County Health Officer's office will be in the Harford County Health Department, 119 Hays Street, Bel Air, Maryland.

* * *

Governor Marvin Mandel has asked the nation's manufacturers of the DDT line of pesticides to eliminate dangerous elements from their products or face having them outlawed in Maryland. At the same time, the Governor announced that he intends to appoint a special committee to investigate the residual effects of all chlorinated hydrocarbon pesticides (DDT, Aldrin, Dieldrin, Endrin, and Heptachlor) on fish, wildlife, crops, and livestock.

Noting that DDT and similar pesticides have been "tremendously beneficial" to mankind, Governor Mandel said that evidence is rapidly accumulating that their potential harmful effects might far outweigh their benefits. The Governor also observed that Sweden already has prohibited the use of DDT and other types of this pesticide and that Arizona has declared a one-year moratorium on its use. Several other states have sharply restricted the use of DDT-type pesticides.

* * *

W. Bradley King, Jr., MD, and **Selvin Passen, MD,** have announced that **M. Wilson Toll, MD,** has become associated with them in the practice of Pathology at the Maryland General Hospital, 827 Linden Avenue, Baltimore, Md. 21201.

* * *

The following anesthesiologists in Maryland have been certified as Diplomates by The American Board of Anesthesiology: **Helmut F. Cascorbi, MD,** Baltimore; **Ralph A. Epstein, MD,** Bethesda; **Emil E. Pollard, MD,** Potomac; **Steven R. Wyte, MD,** Bethesda.

* * *

The Arthritis Foundation has announced the establishment of a permanent organization made up of interested nurses, occupational, physical and vocational therapists, medical social workers and others trained for work with arthritics.

The purpose of the organization is to keep these specialists informed of the new developments and techniques of their professions. Since it is sponsored totally by the Arthritis Foundation, there will be no dues or expenses of membership. Interested professionals should submit their names, addresses, and areas of special interest to Miss Janice Maynard, Chairman, Allied Health Professions Committee, The Arthritis Foundation, 12 W. 25th St., Baltimore, Md. 21218.

SAMPLE DISCHARGE SUMMARIES

Discharge summaries need not be lengthy nor consume the physician's time, contends Dr. Otto Arndal, Assistant Director of the Joint Commission on Accreditation of Hospitals.

In support of his contention, Dr. Arndal has prepared several sample discharge summaries, as follows.

DISCHARGE SUMMARY

Admitted. 1/9/69
Provisional Diagnosis:
Acute biliary colic

Discharged: 1/30/69
Final Diagnosis:
Cholecystitis-
Cholelithiasis

I. Brief History
Male, 55 years, admitted because of acute persistent pain in epigastrium and R. U. Q. of abdoman.

II. Pertinent Physical and Laboratory Findings
X-ray; non-functioning gallbladder.
B. U. N., blood sugar, liver profile and hematology: within normal limits.

III. Course of Treatment
Cholecystectomy: without drainage, inhalation anesthesia
Post-operative course uneventful.

IV. Condition on Discharge
Discharged in good condition; ambulatory.

V. Follow-up and Dicharge Medication
Pt. instructed to follow low fat diet; refrain from lifting and pushing. To call at office in 2 weeks. No medication given.

(Signed)

DISCHARGE SUMMARY

Admitted: 10/5/68
Provisional Diagnosis:
Fracture left femur

Discharged. 11/8/68
Final Diagnosis:
Fracture left femur
ASCHD with left heart-failure & coronary insufficiency

I. Brief History
Female, age 77, fell in home and sustained fracture of left femur. Pt. was confused at time of admission.

II. Pertinent Physical and Laboratory Findings
X-ray: intertrochanteric fracture of left femur.
ECG: left vent. ischemia.

III. Course of Treatment
Sensorium cleared. Pt. developed heart failure, was digitalized and operated uneventfully. Had several episodes of chest pain. Daily physiotherapy during last three weeks of stay.

IV. Condition on Discharge
Discharged to extended care facility via ambulance in satisfactory condition; using walker, bearing weight only on left toes.

V. Follow-up and Discharge Medication
Discharge medication: Digoxin 0.25 mg daily; Valium 2 mg. daily. Arrangements made for progressive physiotherapy at ECF.

(Signed)

DISCHARGE SUMMARY

Admitted: 12/16/68
Provisional Diagnosis:
Cerebral thrombosis with hemiplegia;
Hypertension;
Laceration scalp—left parietal area.

Discharged: 1/21/69
Final Diagnosis:
Same

I. Brief History
66-year-old woman treated previously for hypertension and right hemiparesis. Additional C.V.A.; fell and lacerated scalp.

II. Pertinent Physical and Laboratory Findings
2 cm laceration scalp (L); hemiplegia (L)

III. Course of Treatment
Scalp laceration repaired in emergency department. Only slight improvement under treatment with vasodilators, anti-hypertensive drugs; daily physiotherapy.

IV. Condition on Discharge
Basic cardiovascular status: unchanged—semi-ambulant, scalp wound healed.

V. Follow-up and Discharge Medication
Patient transferred to Chicago Rehabilitation Institute for further treatment; no medication given.

(Signed)

Information for Authors

MANUSCRIPTS: Manuscripts will be accepted for consideration for publication with the understanding that they are original, have never before been published, and are contributed solely to the Maryland State Medical Journal.

All manuscripts are acknowledged upon receipt and are followed up by notification of either acceptance or rejection. Rejected manuscripts are returned by regular mail. Accepted manuscripts become the property of the Journal and are not returned. The Journal is not responsible for loss of manuscripts through circumstances that are beyond its control.

Manuscripts should be addressed to: Editor, Maryland State Medical Journal, 1211 Cathedral St., Baltimore, Md. 21201.

SPECIFICATIONS: Manuscripts must be original typed copy, doublespaced throughout (Including text, case reports, legends, tables and references) with margins of at least 1½ inches. Pages should be numbered consecutively.

The manuscript should include the title (brief and concise), the full name of the author (or authors) with degrees, academic and professional titles, affiliations, and any institutional or other credits. Please include a complete address where the author may receive proofs of his article for his approval and corrections.

All manuscripts should be accompanied by a carbon or Xerox copy and the author should retain another copy for his records.

TABLES: Each table should be typed on a separate sheet of paper, be numbered, have a brief descriptive title, and its position in the text should be indicated.

Be sure that statistics are consistent in both tables and text.

REFERENCES: References should be limited to those citations noted in the text, and kept to a minimum of 18. (A complete review of the literature is rarely desirable.) The references must be typed, doublespaced, and are to be numbered consecutively as they appear in the text, with their positions in the text indicated. An alphabetized bibliography is used only when the listing is of books suggested for supplementary reading.

All references must be checked for absolute accuracy. Each journal reference must include author(s) and initials, complete title of article, name of publication, volume, first page of article, and date. Complete dates (month, day, and year) are to be included with all references that have appeared within the last three years. Include with book references name of author(s) and/or editor(s) with initials, title of book, edition, location, publisher, year, volume (if given), and page. If reference is to a chapter within a book, include the author of the chapter (if different from author of the book), and the title of the chapter, if any.

ILLUSTRATIONS: Authors are urged to use the services of professional illustrators and photographers when possible. Drawings and charts should always be done in black ink on white paper. Clear, glossy photographs, black on white, should be submitted and such illustrations numbered consecutively and their positions indicated in the text.

Magnifications will be modified in proportion to the amount of reduction necessary to fit the pages of the Journal. Please do not deface an illustration by writing on the front or the back, nor should it be taped or pasted to paper. The illustration may be pasted onto a piece of cardboard. Attached to the back of each illustration, chart or photograph should be the figure number, the author's name and the title of the article.

Legends for illustrations should be typewritten on a separate page with numbers corresponding to those on the photographs and drawings.

Recognizable photographs of patients are to be masked and should carry with them written permission for publication.

EDITORIAL RESPONSIBILITY: Manuscripts are subject to editorial modification and such revisions as are necessary to bring them into conformity with Journal style.

Statements made or opinions expressed by any contributor in any article or feature published in the Journal are the sole responsibility of the author.

PERMISSIONS: When material is reproduced from other sources, full credit must be given to both the author and publisher and written permission from these sources must be included when the material is submitted.

COPYRIGHT: Material that is published in the Maryland State Medical Journal is protected by copyright and may not be reproduced without the written permission of both the author and the Journal.

Let's be specific about Campbell's Soups... and *reducing diets*

There are more than 30 million people in America who are overweight. During the next year, you probably will see more than 1,000 of them in your own practice.

One good way to help these patients is to give them a reducing diet based on ordinary eating patterns.

Campbell has prepared a sensible plan for weight control based on ordinary eating patterns. The plan consists of a patient instruction booklet and a set of menus which provide approximately 1,400 calories daily. The menus are balanced to provide the minimum daily requirements of nutrients.

To obtain a supply for your office write to:
Campbell Soup Company, Box 265, Camden, N. J. 08101

NOW IS THE TIME... TO GIVE HER TIME WITH OVULEN-21®

Each tablet contains ethynodiol diacetate 1 mg., mestronol 0.1 mg.

The new mother needs time . . .
to adjust to motherhood,
to give her new baby all the love
and attention he requires.
She needs time for her husband . . .
and for herself as well . . .
so that she can come to terms
with the increased cares
and responsibilities now facing her.
She needs time to decide
when she will have additional children
and how many she will have.

OVULEN-21®

Each tablet contoins ethynodiol diocetate 1 mg., mestranol 0.1 mg.

GIVES HER TIME

Your prescription for Ovulen-21 gives the new mother time to meet her family's present needs...to plan for her family's future.

She can take Ovulen-21 confidently and comfortably month after month. Its dependability is enhanced by its simplicity of use. A woman needs little or no time to learn the simple Ovulen-21 regimen: three weeks on—one week off. And the automatic record-keeping of the petite, virtually "patient-proof" Ovulen-21 Compack® helps to maintain her schedule...helps put time on her side.

Immediately post partum is the time

It is the time when motivation is highest—when a new mother needs expert advice for the future, so she can space her children and limit her family.

It is also the most opportune time, since she is conveniently present in the hospital, for her to be given both instructions and a prescription.

Non-nursing mothers may begin Ovulen-21 immediately after delivery, on the day of departure from the hospital or at the first postpartum visit, as desired. It is recommended that nursing mothers begin Ovulen-21 four weeks after delivery.

A small fraction of the hormonal agents in oral contraceptive pills has been identified in the milk of mothers receiving these drugs. The long-range effect on the nursing infant cannot be determined at this time.

Indication—Orol contraceptian.

Contraindications—Thrambaphlebitis, thromboembalic disarders, cerebral opoplexy or a past histary of these conditians, markedly impaired liver functian, knawn ar suspected carcinoma af the breast, knawn ar suspected estrogen-dependent neoplasia, undiagnosed abnarmal genital bleeding.

Warnings—Watch for the earliest manifestations of thrombatic disorders (thrambophlebitis, cerebrovascular disarders, pulmonary embolism, retinal thrombosis); if present or suspected discontinue the drug immediately.

British studies reparted in April 1968[1,2] estimate there is o seven- ta tenfold increase in mortality and morbidity due to thromboembolic diseases in women taking oral cantraceptives. In these controlled retrospective studies, invalving 36 reparted deaths and 58 hospitalizations due ta "idiopathic" thrombaembolism, statistical evaluation indicated that the differences observed between users and non-users were highly significant. The conclusians reached in the studies ore summarized in the table below:

Comparisan af Martality and Haspitalizatian Rates Due to Thromboembolic Disease in Users and Nan-Users af Oral Cantraceptives in Britain.

Categary	Martality Rates		Haspitalizatian Rates (Morbidity)
	Age 20-34	Age 35-44	Age 20-44
Users of Orol Contraceptives	1.5/100,000	3.9/100,000	47/100,000
Non-Users	0.2/100,000	0.5/100,000	5/100,000

Na comparable studies are yet available in the United States. The British data, especially as they indicate the magnitude af the increased risk to the individual patient, cannot be applied directly to wamen in other countries in which the incidences of spontaneously occurring thromboembolic disease may differ.

Discontinue medication pending examination if there is sudden partial or complete loss of visian, or sudden onset of praptasis, diplapia or migraine. Withdraw medicatian if papilledema or retinal vascular lesians are faund.

Since the safety of Ovulen in pregnancy has nat been demonstrated, it is recommended that pregnancy be ruled aut for ony patient wha has missed twa consecutive periods before continuing the contraceptive regimen. If the patient has not adhered to the prescribed schedule the passibility of pregnancy should be considered at the first missed periad.

A small fraction of the hormone agents in orol contraceptives has been identified in the milk of mothers receiving these drugs. The long-range effect on the nursing infant cannot be determined at this time.

Precautions—Pretreatment physical examinatian should include special reference to the breasts and pelvic organs, and a Papanicolaou smear.

Endacrine and possibly liver function tests may be affected by Ovulen. Therefore, it is recammended that such tests if abnormal be repeated after the drug has been withdrawn for two months.

Pre-existing uterine fibromyomas may increase in size under the influence of pragestogen-estrogen preparations.

Because these agents may cause some degree of fluid retention, conditions which might be influenced by this factor, such as epilepsy, migraine, asthma, cardiac or renal dysfunction, require careful observation.

In breakthrough bleeding, and all irregular vaginal bleeding, consider nonfunctianal causes. Adequate diagnostic measures are indicated in undiagnosed vaginal bleeding.

Carefully observe patients with a history of psychic depression and discantinue the drug if severe depression recurs.

Any possible influence of prolonged Ovulen therapy on pituitary, ovarian, adrenal, hepatic ar uterine functian awaits further study.

A decrease in glucase taleronce has accurred in a significant percentage af patients on oral contraceptives. The mechanism of this decrease is obscure. For this reason, diabetic patients should be observed carefully while receiving Ovulen.

Because of the effects of estrogens an epiphyseal closure Ovulen should be used judiciously in young patients in whom bone growth is not complete.

The age of the patient constitutes na absalute limiting factor, although Ovulen therapy may mask the anset of the climacteric.

The pathalagist should be informed of Ovulen therapy when relevant specimens are submitted.

Adverse Reactions—A statistically significant assaciation has been shawn between use of oral contraceptives and the following serious adverse reactians: thrombophlebitis, pulmonary embolism.

Although available evidence is suggestive af an association, such a relatianship has been neither confirmed nar refuted for the following serious adverse reactions: cerebrovascular accidents, neuro-acular lesions, e.g., retinal thrombosis and optic neuritis.

The following adverse reactions are known to occur in patients receiving oral contraceptives: nausea, vomiting, gastrointestinal symptoms (such as abdominal cramps and blooting), breakthrough bleeding, spotting, change in menstrual flaw, amenorrhea during and after treatment, edema, chloasma ar melasma, breast changes (tenderness, enlargement, secretion), change in weight, changes in cervical erosian and cervical secretians, suppression of lactation when given immediately post partum, cholestatic jaundice, migraine, allergic rash, rise in blood pressure in susceptible individuals, mental depressian.

Although the following adverse reactians have been reported in users of aral cantraceptives, an assaciation has been neither confirmed nor refuted: anovulatian post treatment, premenstrual-like syndrome, changes in libido, changes in appetite, cystitis-like syndrome, headache, nervousness, dizziness, fatigue, backache, hirsutism, loss of scalp hair, erythema multiforme and nadosum, hemorrhagic eruption, itching. The following labaratory results may be altered by oral cantraceptives: hepatic function: increased sulfobromaphthalein and other tests; coagulatian tests: increase in prothrombin, Factors VII, VIII, IX and X; thyroid function: increase in PBI and butanol extractable protein baund iadine, and decrease in T^3 uptake values; metyrapane test; pregnanedial determinatian.

Where "The Pill" Began

G. D. SEARLE & CO., P.O. Box 5110, Chicago, Ill. 60680 SEARLE

an antibiotic you can use without risk to the kidney

Polycillin-N

(sodium ampicillin)

the penicillin you use like a broad-spectrum antibiotic

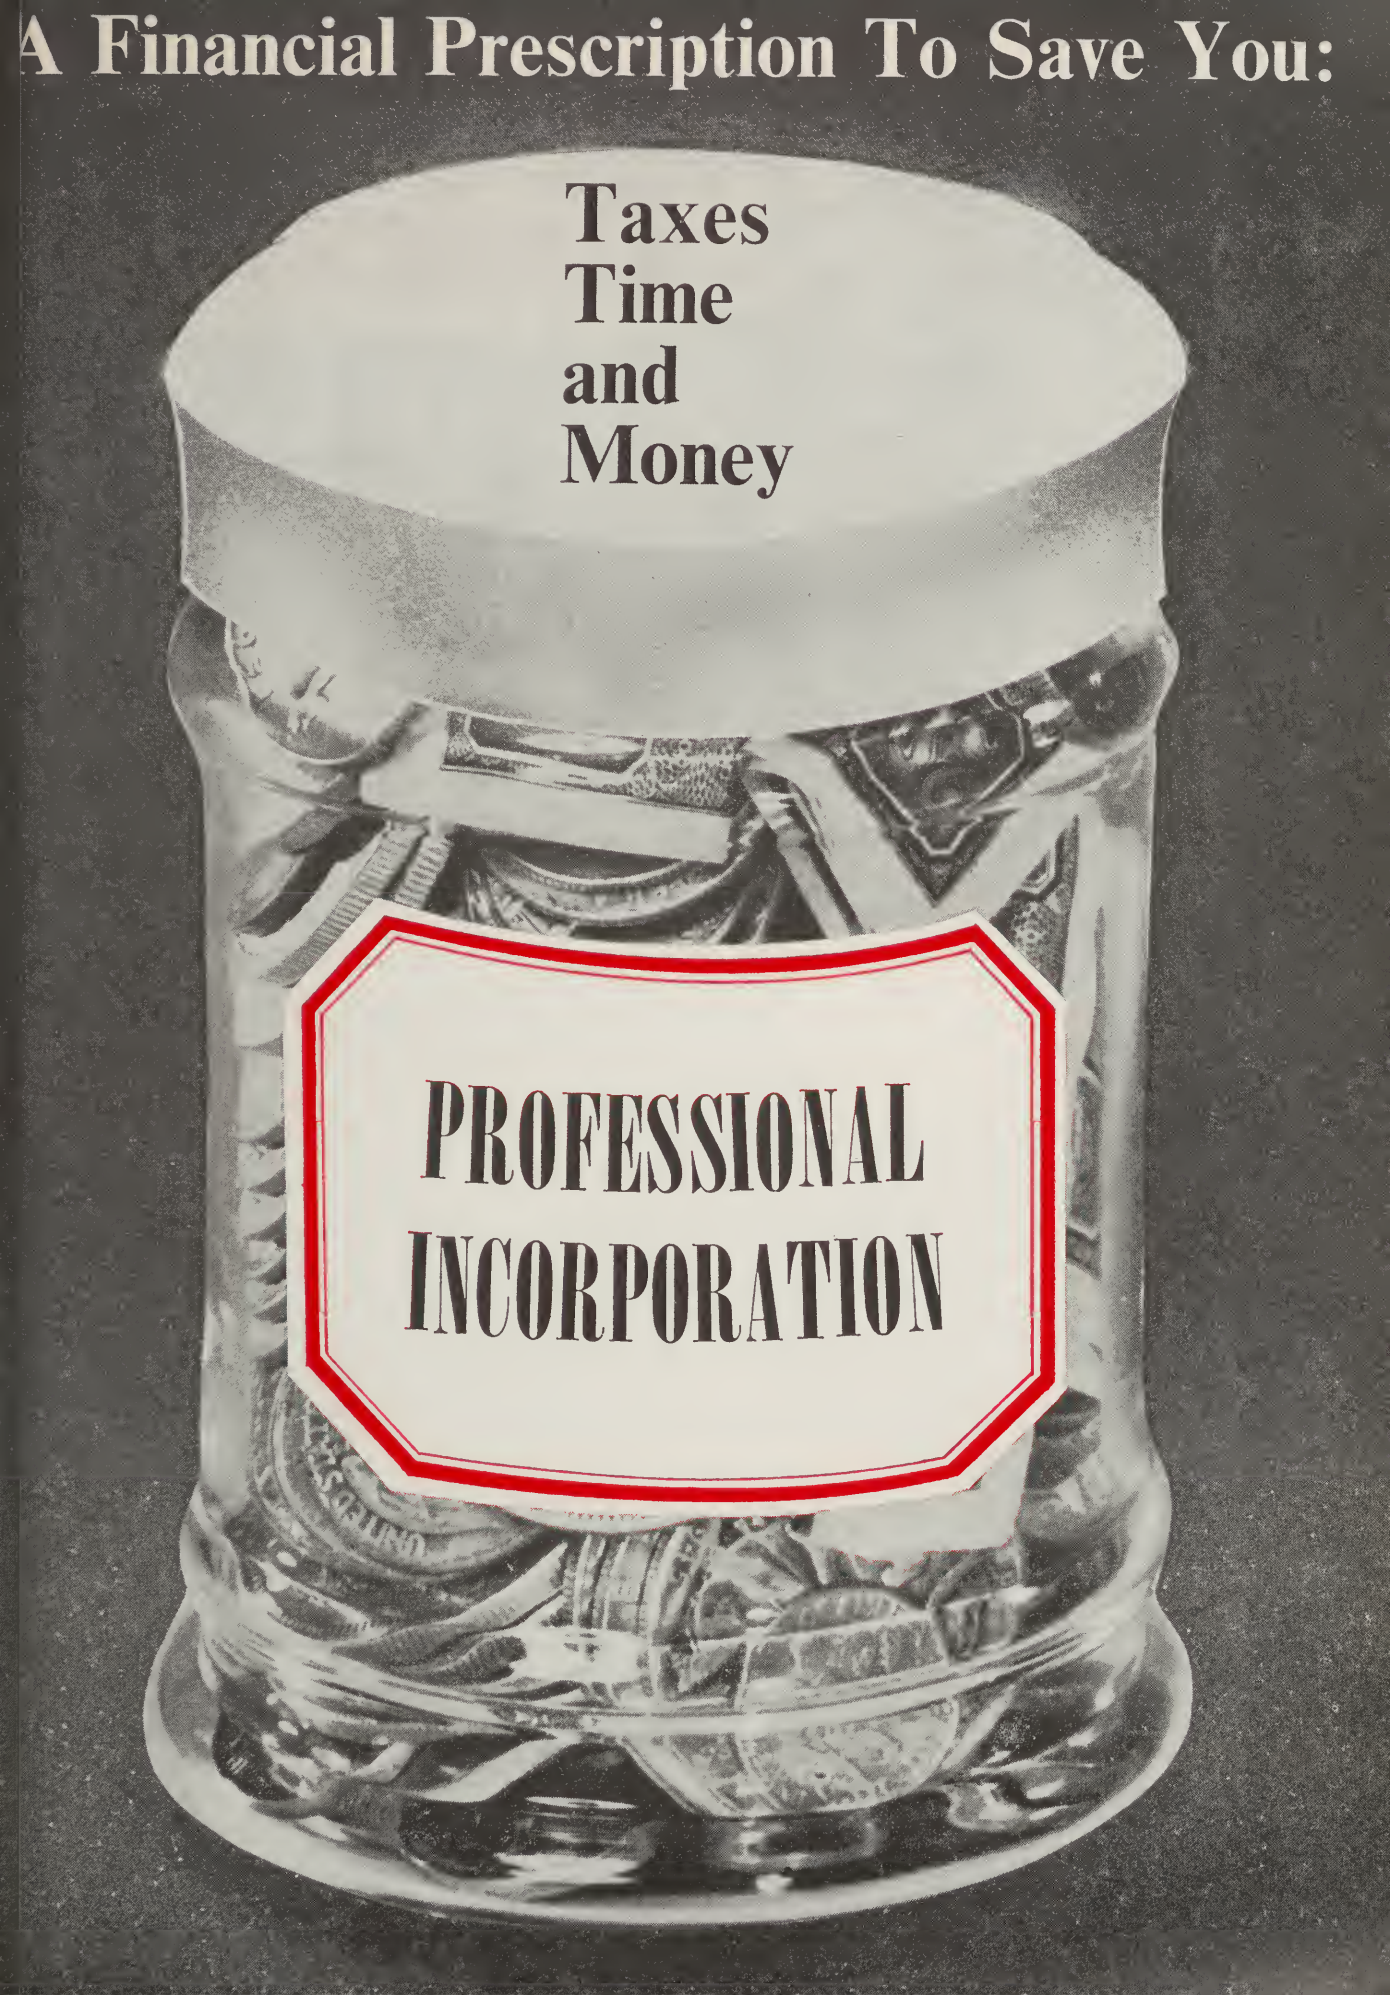
PRESCRIBING INFORMATION. 11—1/2/69. For complete information consult Official Package Circular.

Indications: Infections due to susceptible strains of Gram-negative bacteria (including Shigellae, *S. typhosa* and other Salmonellae, *E. coli, H. influenzae, P. mirabilis, N. gonorrhoeae* and *N. meningitidis*) and Gram-positive bacteria (including streptococci, pneumococci and nonpenicillinase-producing staphylococci).

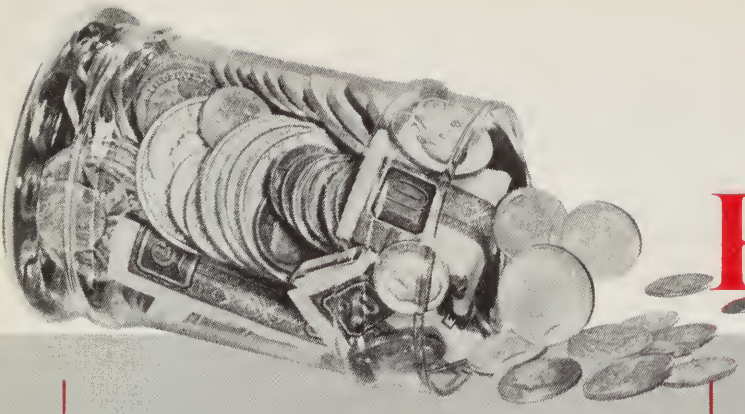
Contraindications: A history of allergic reactions to penicillins or cephalosporins and infections due to penicillinase-producing organisms.

Precautions: Typical penicillin-allergic reactions may occur, especially in hypersensitive patients. Mycotic or bacterial superinfections may occur. Experience in newborn and premature infants is limited and caution should be used in treatment, with frequent organ function evaluations. Safety for use in pregnancy is not established. In gonorrheal therapy, serologic tests for syphilis should be performed initially and monthly for 4 months. Assess renal, hepatic and hematopoietic function intermittently during long-term therapy.

Adverse Reactions: Skin rash, pruritus, urticaria, nausea, vomiting, diarrhea and anaphylactic reactions. Mild transient elevations of SGOT or SGPT have been noted. Black tongue has been noted in some patients receiving the Chewable Tablets.



Usual Dosage: Adults—250 or 500 mg. q. 6 h. (according to infection site and offending organisms). Children—50-100 mg./Kg./day in 3 to 4 divided doses (depending on infection site and offending organisms). Bacterial meningitis—150-200 mg./Kg./day in 6 to 8 divided doses. Children weighing more than 20 Kg. should be given an adult dose when prescribing orally. In parenteral administration, children weighing more than 40 Kg. should be given an adult dose. Beta-hemolytic streptococcal infections should be treated for at least 10 days.



Supplied: Capsules—250 mg. in bottles of 24 and 100. 500 mg. in bottles of 16 and 100. For Oral Suspension—125 mg./5 ml. in 60, 80 and 150 ml. bottles. 250 mg./5 ml. in 80 and 150 ml. bottles. Chewable Tablets—125 mg. in bottles of 40. Injectable—for I.M./I.V. use—vials of 125 mg., 250 mg., 500 mg., and 1 Gm. Pediatric Drops—100 mg./ml. in 20 ml. bottles. **A.H.F.S. Category 8:12.16**

A Financial Prescription To Save You:

Incorporate Professional

Professional Corporations Get Green Lights

On July 1, 1969 the Maryland Professional Service Corporation Act became effective. It permits physicians, dentists, laywers, and other professionals to incorporate and become eligible for all the benefits of corporate employees.

On August 8, 1969, the Internal Revenue Service, after opposing professional corporations for many years, announced "it is conceding that organizations of physicians, dentists, lawyers and other professional people, organized under state professional asssociation acts, will, generally, be treated as corporations for tax purposes.

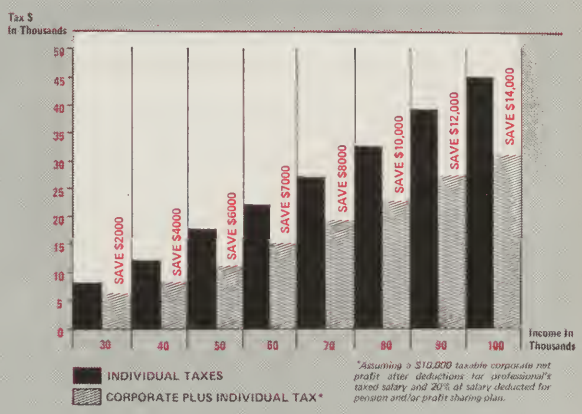
What Incorporation Does For You:

- ☐ **A Corporation Pays Much Lower Taxes— 22% on the first $25,000 of taxable net profit, 48% on taxable net profit in excess of $25,000.**
- ☐ — You may contribute much more than the extremely limited proportion of your income now permitted under HR10 (The Keogh Act). Contributions to the fund are fully tax deductible. Investment income earned by the trust is exempt from income taxes. As trustee, you may select your own investment.
- ☐ **Defer Participation in the Profit-Sharing Plan for up to five (5) years.**
- ☐ **Postpone ownership of participant's funds.**
- ☐ **Group life and health insurance.**
- ☐ **Medical payment plans.**
- ☐ **Disability income programs.**
- ☐ **Deferred compensation agreements, stockholder's agreements in conjunction with your personal estate plan.**

nder Maryland's New
ervice Corporation Act

Reduced Taxes = Reduced Personal Liabilities

Under the statutes provided by The Maryland Professional Service Corporation Act, you as a corporate employee, are protected by established limits of liability (except malpractice). The members of the corporation are not personally liable for the debts, liabilities or contractual obligations of the corporation.



If you earn less than $40,000 per year . . .

Don't Incorporate

Incorporation is a complex process, and the adoption of a pension and/or profit-sharing plan acts as your tax shelter. Unless you can save at least $2000 in taxes, the time and expense involved in incorporation is not warranted!

Savings At Various Salary Levels

Why A Professional needs a Professional when incorporating

You are highly trained and skilled in your field. No ordinary citizen could perform the services which you proffer. The same is true of financial planning. You need an expert to guide you. You need Professional Associations Division.

Why professional managemen

Professional Associations Division was organized specifically to help professional men take best advantage of the new Maryland Professional Service Corporation. Qualified experts in the field of financial management, pension and profit-sharing plans, exempt sick-pay plans, and tax-free group life insurance plans serve on our staff.

Our experts aid your attorney, accountant or other financial advisors in the formation of the profes–sional corporation. We will assist you and your con-sultants in developing pension and profit- sharing plans which qualify for preferential tax treatment under the Internal Revenue Code.

The invaluable service we offer you, and it is unique in this area, can save you thousands of dollars–and many hours of your valuable time. In consideration for our services, Professional Associations Division charges a fee of $250.00 and stipulates that any mutual fund or insurance investments selected by the trustees be obtained through Professional Associations Division.

Professional Associations Division prescribes a generous dose of financial planning to make your professional corporation, and your financial future, strong and healthy!

Want to find out more about this opportunity for tax shelters? Professional Associations Division is sponsoring a seminar, preceded by cocktails and buffet on "Professional Corporations– The New Laws" on Wednesday, October 15th 1969 at the Baltimore Statler-Hilton Hotel at 7:00 P.M. This seminar is especially designed to acquaint you with this new legislation.

MED-CHI TOURS

The Medical and Chirurgical Faculty is sponsoring two exciting tours in the near future:

FIESTA IN SPAIN—October 31 to November 8, 1969

A deluxe all-inclusive tour leisurely exploring the wonders of the romantic country of Spain.

ORIENTAL CARNIVAL—May 1 to May 17, 1970

A fabulous deluxe tour leaving from Friendship Airport. This, too, is all-inclusive with six fun-filled days and nights in Tokyo, seven glorious days and nights in Hong Kong, three enchanting days in Honolulu. An opportunity is provided to visit the fabulous 1970 Japan World Exposition in Osaka via the famous "Bullet" train (140 m.p.h.). Included are sightseeing tours, a get-together cocktail party, dinners in restaurants of your choice, breakfasts, and many other attractions.

Make your reservations NOW: For information and reservations contact Mrs. Beverly Wolins, Travel Guide Agency, 416 North Charles Street, Baltimore 21201 (301-727-0680) or Mrs. Genevieve Ritchie, the Faculty office, 1211 Cathedral Street, Baltimore 21201 (301-539-0872).

GUEST EDITORIAL . . .

Service Program —

American Cancer Society, Maryland Division, Inc.

When cancer strikes, the American Cancer Society helps.

This statement is the theme of a state-wide public information campaign to focus attention on the Society's program of service to cancer patients in Maryland.

The American Cancer Society wants to help, but in too many instances there is no request. Since the physician plays a most important role in caring for cancer patients, the Society's objective is to keep the medical profession informed of the various services available. It is hoped that physicians will suggest to their cancer patients or families that they call their local Unit of the American Cancer Society for information and counseling.

As stated in the Maryland Division's brochure, *People Helping People,* "A cancer patient frequently needs help—lots of help. The American Cancer Society feels that to help cancer patients and their families is an important part of the Crusade to conquer this disease. . . . Many services are available to all cancer patients, while others are limited to those who need financial assistance. However, there is never a charge for any service provided by the Society. . . ."

The Maryland Division is committed to a program of financial assistance to the cancer patient and has established a comprehensive program of varied services to meet the needs of cancer patients in the State. The program is administered at the local level by Unit volunteer service committees in each of the 23 counties and Baltimore city. The Unit (county) Service Chairman and Committee arrange for those services which are available upon request to all cancer patients. An application is not necessary for these services. The Service Committee also distributes, and in turn receives, reviews, and approves all applications for services which require financial assistance.

The Maryland Division, through its Units, does not have unlimited funds available for the Service Program. A patient's eligibility is determined by the Unit Service Committee, after reviewing all facts supplied in the application for financial assistance. The American Cancer Society feels that this flexibility is necessary since the definition of "medically indigent" varies greatly throughout Maryland.

Every effort is made to assist each cancer patient in some way, depending upon the degree of the patient's need. Often, due to their experience and knowledge of other community resources, the Unit Service Committee is able to obtain assistance from community agencies or organizations, or both, with which the patient or family may not be aware.

Patient services are those services available to cancer patients in the home and are intended to relieve some of the physical, emotional, and financial problems which most often accompany cancer.

The following services are available to all cancer patients upon request:

Information and counseling

Surgical dressings

Sickroom equipment such as hospital beds, wheelchairs, blenders, walkers, portable commodes, etc.

Financial assistance is provided for the following services to eligible cancer patients (the patient or family must submit an application for assistance which is available from the Unit Service Chairman):

Medications

Visiting Nurse services

Rehabilitation program

Room and board while receiving outpatient treatment

Homemaker services

Laboratory services (limited)

Transportation (when volunteer transportation is not available)

The following services are not provided for under the program:

Physicians' and surgeons' fees

Hospital care costs

X-ray therapy

Clinical services

Nursing home services

Additional information about the American Cancer Society, Maryland Division Service Program may be obtained by contacting the local American Cancer Society Unit listed in the telephone directory.

Psychiatry for the Family Physician

The Maryland Academy of General Practice held its 21st Annual Scientific Assembly at the Airlie Foundation in Warrenton, Virginia from May 9-12, 1969. This year we chose as our theme "Psychiatry for the Family Physician."

Psychiatry touches every facet of family practice and, in many ways, is a cornerstone for this type of practice. Wittingly or unwittingly, every physician who sees patients practices psychiatry. The mere giving of a prescription has marked psychiatric implications. After all, doesn't this imply that the physician knows what is wrong and the medicine he is prescribing is what is needed to effect a cure?

As we conquer more of the physical diseases to which man falls heir, and as our society becomes more complex, it seems that the Pandora's box of emotional illnesses opens wider all the time. It seems certain that psychiatry for the non-psychiatrist will become increasingly important in the immediate future.

The approach of the symposium on psychiatry began with behavior problems in children and ended with the problems of senesence. We heard talks about adolescence, the crisis of the middle years and conjoint family therapy, as well as sex education.

Of particular interest and outstanding value, was the movie produced by Dr. Murdock Head, at the Airlie Foundation, entitled *THE DISTANT DRUMMER*. This film, a documentary which deals with narcotics addiction, has been seen on television on a nation-wide basis. This film should certainly be seen by every member of the medical profession.

Another timely talk dealt with some of the problems of our national disgrace—the urban ghettos. These are problems which keep drawing national attention with increasing insistence—problems which can no longer be denied. Solutions to these problems certainly must be found if we are to survive as a nation.

It is readily apparent that a great deal of material was covered in a day and a half. It is difficult to measure the success of a meeting such as this; but if one leaves with one new thought or one new way of looking at things, then for him the meeting was worthwhile.

Since its inception, the American Academy of General Practice has been dedicated to the concept of continuing education. The extent to which the individual members support such activity validates the purpose of the Academy. The Academy is the only professional organization that requires regular participation in postgraduate education. The American Board of Family Practice is the first specialty board to require periodic re-examination and recertification. It seems rather certain, however, that some universal method of insuring continuing professional competence is only around the corner.

A special word of thanks is due our speakers for giving so generously of their time and talent and to the drug firms, Roche Laboratories and Merck Sharp and Dohme, for financing this outstanding symposium.

WILLIAM L. STEWART, MD
President
Maryland Academy of General Practice

The following papers were presented during the Annual Meeting of the Maryland Academy of General Practice, May 9-12, 1969, Warrenton, Virginia.

THE DRUG ISSUE

MURDOCK HEAD, MD
Professor and Chairman
Department of Medical and Public Affairs
George Washington University Medical Center

For the last two years our camera crews have traveled around the world through various cities filming transient American youth from Kat Mandu in India to the Gulf of Aqaba in Israel.

The drug problem plays a large part in the unrest among our youth. It is also a focal point for crime. The drug problem is going to get larger for those of you who practice in urban areas. It is even beginning to surface in rural areas. In Madison, Wisconsin, a year and a half ago, a junior high school was "busted" by the police. At that time they found ten- and twelve-year-olds both "pushing" and using marijuana.

The drug picture breaks down like this: Basically, marijuana is the drug for the young, and it is fed by the amateur. The Mafia does not involve itself with marijuana. For one thing, it cannot compete with the youngsters who hollow out surf boards, carry it in ice cream cones, or bicycle seats. You can grow marijuana any place. Marijuana, as you probably know, is a product of the plant, *cannibis sativa,* which is the female of the hemp family. Students in boarding schools can grow it in their flower boxes; farmers grow it between rows of corn.

Uncle Sam must assume some of the responsibility for the marijuana problem. During World War II, the farmer was encouraged to grow *cannibis* for hemp to be used by the Navy. He was encouraged to plant it wherever it would grow, and, as we have already noted, it will grow almost anywhere.

As revealed in the film, *THE DISTANT DRUMMER,* the strongest marijuana comes from the Tropics. The kids will pay as much as a dollar for what they call the "golden stick" or "Acapulco Gold." Marijuana is called by many different names. In North Africa, for example, it is called "kief." Farmers there can make more money by growing "kief" and trading it for cooking oil, staples, salt and meat, than they can in trying to euchre crops from an impossible terrain. Countries in which poor farmers require the basic necessities of food and ordinary comforts can fare much better by raising marijuana, than they can with ordinary crops. The countries in which this situation exists are the *producing countries.* The second element in the equation is the *consumer country.* The United States is a tremendous consumer of drugs, not just marijuana, but tranquilizers, sleeping pills, and many others. This country is on a drug binge. When there are producing areas and consumer areas, then "money" becomes the name of the game. The cornerstone of the drug problem is money, money, money.

I am not a psychiatrist. I will not attempt to analyze this aspect of the drug problem, nor to discern the motivation of youth to take it. I might point out, however, that youth is revolting. What are they revolting against? They are revolting against

The problems of the inner city are directly related to the environment. A great many of our concerns, particularly in the psychiatric area, are related to the environment. The drug issue is one of these.

us in the establishment—they do not like what we do. They believe we are hypocritical. They do not adhere to our economic objectives, our sexual mores, our sociocultural norms. They want to "cut out." They are also protesting Viet Nam. This is a War that nobody likes. They are revolting against all sorts of things, but in Sweden where there has been no war for 200 years, and cradle-to-the-grave security, there are 10,000 registered adolescent amphetamine addicts. Amphetamines were brought into Sweden by the German army, who used them early in the War to give the troops courage. Sweden has one of the highest rates of drug addiction in the world, the highest suicide rate, one of the highest divorce rates, the highest rate of alcoholism, and one of the highest instances of duodenal ulcers in the world.

I have spent two and a half years in the back alleys and the ghettos of the world, but I can assure you, the drug problem is as much a middle-class problem as it is a ghetto problem. Heroin *is* basically a ghetto problem. People in the ghettos want to get out any way they can and heroin is the quickest road out. Marijuana may be used at one time or another by 50% of the students in universities. They are not always potheads and they do not always move to heroin. I do not wish to enter into the argument of whether or not marijuana is addictive, or whether or not it is a physical or psychological problem. I can tell you I have seen many users, and if there is a *psychic dependency* upon this or any other drug, including alcohol, there *is* an element of addiction.

The drug problem is very much with us. There is one major truth we must face; as long as there are kids in the ghettos taking drugs and we enforce the law, they may be given four years for possession, and up to forty years for pushing. Addicts must steal $500 a day retail, to resell it to a fence for $100 to feed their habit. Few Americans really care what happens to these addicts. However, when the law invades a middle-class high school where your and my sons and daughters are, there is trouble in enforcement.

My 12-year-old daughter can buy "pot" in the girls' room in her junior high school anytime she wants to walk in and get it. Many of you don't believe this happens. I can assure you it does happen and I can promise you there is more alienation between our children and us than we know. How many of you with teen-agers can talk to them? Do you get through to them? Can they get through to you? This is the real problem of the middle class. If we enforce the law in the suburbs, we must arrest the sons and daughters of physicians, judges, and important business men. These students can also get four years for possession and forty years for pushing. We have laws on the books that the police officials are obligated—in theory—to enforce, but they cannot "equally" enforce them. There is a real dichotomy here. You cannot legislate morality, so we are faced with a real conflict of law in dealing with marijuana, the psychedelic drugs, and the amphetamines, as well as hard drugs.

You people see these problems at the first level, and need to gain sophistication about drugs. You must know a great deal more about drugs than you do. My role as a communications professional—as an educator turned propagandist—is to attempt to bridge between what is known in research and what you physicians are practicing. Don't forget the word *consumer*. You call him a patient, a lawyer calls him a client. These consumers are a sophisticated group, particularly the young ones who, according to Marshall McLuhan, have watched 4,000 hours of television before they begin school. These children are alienated and restive. As they become more restive, Congress hears about it, and when Congress is stirred, it acts. We physicans must take a leadership role, not only in drugs, but across the board in medicine, to affect the direction of American medicine. Each of the issues that disturbs the consumer, such as drugs, must be of concern to us. I believe it is extremely important that in your Academy you make yourselves available to speak to high schools, to university groups, to Kiwanis clubs, to Rotarians—anywhere you can. Be there and try to reach the consumer. I encourage you to talk to your elected officials. I encourage you gentlemen to move into the 20th century and talk about the problems that are concerning our citizens, while, at the same time, stay in touch with your officials.

I hope you will watch for the first of our television series on drug abuse. It is entitled *A MOVABLE SCENE* and is narrated by Robert Mitchum. It will appear in over 100 television stations, in schools, in community organizations, and elsewhere.

RECOGNIZING THE SUICIDAL PATIENT

Depression is a serious systemic disease with psychological and physiological expression, of which suicide is very much a part. The person seriously contemplating suicide does this from a sense of profound despair and feeling of hopelessness. The diagnosis of despair is a difficult and elusive one, and we must listen attentively with "the third ear" to tune it in. The doctor must pay attention to his patient's social nutrition and to the feelings the patient arouses in him. Once convinced that the patient wants to die and is making plans, secrecy should be swept away and the patient's isolation attacked. If in doubt, hospitalize.

BERNARD R. SHOCHET, MD, FACP
Acting Chief
Department of Psychiatry
Sinai Hospital of Baltimore, Inc.

Depression is a prevalent, systemic disease ranging in severity from a mild neurotic reaction to the profound retardation or restless misery of severe melancholia. Depressive states are also encountered as effective equivalents—periodic spontaneously remitting physical illnesses, such as, rheumatism, asthma, peptic ulcer, and dermatitis. Because of the frequent occurrence of somatic complaints, the depressed patient usually turns to the family physician before making serious self-destructive attempts.

Depression is a terrifying disease. It begins insidiously with feelings of apprehension and despondency. It is almost impossible to pin point when the illness begins. It may progress to a state of severe agitation or profound apathy. There is global somatic dysfunction, as well as inability to perform ordinary tasks. There are usually characteristic vegetative disturbances, such as, sweating, flushes, dryness of the mouth, constipation, weight loss, and early morning rising. The depressed patient will feel his worst in the morning but may improve as the day wears on.

Characteristics of Depression

1. **Lowering of mood**
2. **Slowing of thought processes**
3. **Slowing of muscular activity**
4. **Vegetative disturbances**
5. **Feelings of guilt and worthlessness**
6. **Somatic complaints**

It has been postulated that in depressive illness there is a neuro-physiologic disturbance in the amygdala and associated reticular formation relating to an abnormality in catecholamine metabolism. Psychologically, there is a real or threatened loss of a love object and an incapacity to reinvest this energy into other objects. This leads to withdrawal from the world, combined with self-accusation and guilt. There is an associated decrease in self-esteem and intense feelings of helplessness and hopelessness.

Early in a depression, the patient has a pervasive feeling that something is wrong. This is usually focused on some physical experience or concern.

There are the associated vegetative symptoms of early morning rising, anorexia, weight loss, and constipation. The blood pressure may be elevated. The patient may or may not be able to verbally express his feelings of guilt and concern about his life problems.

Depression may occur during any period—including childhood and adolescence. This may herald a schizophrenic illness or be the beginning of a life long manic-depressive illness. In adolescence and early adulthood, this may represent the response of an immature personality to the increasing responsibilities and frustrations of adulthood and may lead to suicidal gestures. Thus, suicidal gestures and depression in adolescents and young adults may reflect quite different kinds of emotional illnesses.

Usually in unstable and immature young people, there is no great threat to life. The problem is primarily one of immaturity and impulsiveness in the face of an acute situational problem. On the other hand, psychotic illnesses in this age group may be heralded by depression or suicidal gestures.

Failure to correctly evaluate a depressive illness in an older adult is a serious error, as this group constitutes the greatest suicidal risk. The patient usually does not complain of depression or suicidal intent, and the physician must elicit this information by asking specifically about the patient's sleep pattern, spirits, outlook, and suicidal intent.

Occurrence of Depression

A. Childhood and Early Adolescence
- **1. Beginning of schizophrenic illness**
- **2. Beginning of manic-depressive illness**

B. Late Adolescence and Early Adulthood
- **1. Immaturity**
- **2. Increasing responsibilities**

C. Middle Age and Older
- **1. Greatest suicidal risk**

Symptoms of depression include depressive feelings, expressed or implied, shifting and diffuse somatic symptoms, agitated motor behavior, self-depreciatory thoughts, and the aforementioned vegetative signs. Suicide is part of this syndrome.

Prior to the depressive illness, the patient usually has manifested a compulsive character disorder. He is responsible, conscientious, hyperindependent, someone to confide in—a support of the world. He manifests outstanding qualities of reserve, integrity, steadiness, and uncomplainingness. Frequently, there is a history of loss of a key family member in the patient's early years.

Pre-Morbid Personality

1. **Compulsive character structure**
2. **Responsible**
3. **Hyperindependent**
4. **Takes care of others**
5. **Uncomplaining**

Certain organic illnesses present with depression, such as, chronic pancreatitis, carcinoma of the body of the pancreas, brain tumor, chronic toxic states 2° to the chronic ingestion of bromides or barbiturates, and prolonged treatment with high dosage of reserpine and many endocrinopathies. Depression and precipitate suicide may occur with the use of drugs, particularly with LSD.

Organic Illnesses Associated with Depression

A. Pancreatic Disease
- **1. Chronic pancreatitis**
- **2. Carcinoma of Body of Pancreas**

B. Brain Tumor

C. Chronic Toxic States
- **1. Bromides**
- **2. Barbiturates**

D. High Dosage of Reserpine

E. Endocrinopathies

Suicide is part of the syndrome of depression. It is the 12th most common cause of death in the United States, the ratio of attempted to successful suicide being about 8:1. Suicide is also the second highest cause of death in the adolescent age group.

Suicide is the final common pathway of diverse circumstances. Most people have had suicidal thoughts or even suicidal impulses. These are most frequent in adolescents, but no time of life is free of them.

The person considering suicide is always ambivalent—he wishes to live at the same time as he wishes to die, and because suicide is a cry for help, the potential victim will almost always signal his intention. The cry for help is often disguised or in code, so the potential rescuer must be able to interpret it.

There are usually some verbal or behavioral clues as to intent, which may be conscious or unconscious appeals for help before the suicidal act occurs. It has been reported that more than half of those committing suicide had seen a physician within three months of the event and 25% had had psychiatric contact. Many studies point to a disruption of close personal relationships as being the main precipitating factor in suicidal behavior.

There are certain groups in which the risk of suicide is considerably higher than among the general population. In the aged, high risk is correlated with mental ill health, social isolation, death of a loved one, or loss of social role. On the other hand, personal and domestic problems are associated with the high rate of suicide in younger age groups, and many studies reveal a high incidence of broken homes early in youth.

There is a particularly high incidence of suicide accompanying depressive illness, especially when endogenous. The occurrence of successful suicide,

within one year of an aborted attempt, is well documented. Eight out of ten people who successfully commit suicide have previously attempted or threatened suicide.

High-Risk Groups for Suicide

1. **Depressed patients**
2. **Chronically ill and isolated**
3. **Bereaved**
4. **Previous suicide attempts**
5. **Previous suicide threats**
6. **Current verbal or behavioral declarations of suicidal intent**

The vast bulk of suicidal attempts spring from despair and helplessness before a life crises. Many people fail to express despair openly. Instead, they respond to helplessness in ways that make their desperation unrecognizable. Despair can be as difficult and elusive to diagnose as the most difficult disorder or disease that is encountered in general medicine.

In the recognition of suicide the doctor must use all available information. The psychological processes that lead to suicide are obscure: It is the secrecy and stealth that make the diagnosis so difficult.

The doctor must observe the patient for objective signs and symptoms. He must gain an understanding of the environmental ecology of the patient—his *social nutrition*. He must try to understand the inner experience of the patient and he must be aware of the feelings elicited in himself by the patient. Feelings are contagious and so the physician has an instrument within himself to detect the concealed despair in his patient. He then must evaluate all this data from various sources and decide what psychologic processes are at work: What is bizarre, what doesn't fit?

Recognizing the Suicidal Patient

1. **Observation for objective signs**
2. **Evaluation of social nutrition**
3. **Evaluation of inner experience of patient**
4. **Awareness of feelings elicited in himself by the patient**

The physician may be annoyed or saddened by angry or depressed people. We should be aware that our own reactions of this nature are part of this clinical picture. Beware of depressed people who recover suddenly without obvious reason. The patient may have decided to die. Pseudocheerfulness can also lead us astray.

The patient should be asked if he wants to die; a flat denial is not to be accepted at face value, especially if the doctor discerns persistent hopelessness in the patient. The physician should ask himself, "Does the patient feel his life is now worth living?" Another issue of great importance is whether anyone wants the patient to live. The patient may be unwittingly and unconsciously invited to suicide by a key family member. What is the condition of the patient's social nutrition?

The physician's first task is to form a relationship with the patient. The second is to be able to accept what that relationship reveals. Our job is to clarify—not to reassure or criticize—and to try to make the patient feel understood, and to discuss what matters are powerful sources of encouragement to him. A sense of isolation is very dangerous for the depressed person. The physician should try to convey to the patient that he understands how badly the patient feels.

First Aid for the Potential Suicide

1. **Form a relationship with the patient**
2. **Be able to accept what is revealed**
3. **Attack the isolation of the patient**
4. **Give only small quantities of medication**
5. **Involve the family**
6. **Psychiatric hospitalization if safety is in doubt**

If the physician thinks suicide is a definite possibility, large amounts of medication should not be given to the patient. A definite return appointment should be given. The family should be involved as soon as possible in the planning for the patient, just as in any other medical emergency. Successful suicide thrives on secrecy. If the family situation seems weak or unsupportive, or if for any reason the physician feels uncomfortable or very concerned about the patient's safety, hospitalization in a psychiatric facility should be insisted upon and accomplished rapidly. This will prove to be a relief to the patient and the family.

After all this is said, there will be a certain number of patients who are especially determined and especially secretive and who will act on their decision to die. This can be a sobering experience indeed.

Behavior Disorders in Children

RUTH W. BALDWIN, MD
Associate Professor of Pediatrics
Director of the Clinic for the Exceptional Child,
University of Maryland School of Medicine

In the past 20 years, especially in the last five years, much has been written about organic behavior disorders or brain damaged children under some 38 different terms, such as, Minimal Brain Damage, Minimal Brain Dysfunction, Brain Injury, Brain Damage, Hyperkinetic Syndrome, and Percentually Handicapped. Behavior problems, formerly considered emotional ones, are now being recognized as organic in origin.

Diagnosis may be made by history of abnormal behavior, soft signs in neurological examination, abnormal psychological evaluation, and abnormal electroencephalograms. Treatment must be three-prong—medical management with various medications, counselling, and educational planning.

Etiology

Many physicians, sociologists, and psychologists have considered behavior and learning disorders to be closely associated with child rearing and interpersonal relationships. Recently, it has become popular to attribute these problems to socioeconomic, environmental factors, especially since many of the problem children dwell in the poorer inner-city areas. Psychiatrists have been and still are treating these children primarily as emotionally disturbed.

Even so, it is easy to find some rejection, hostility, overprotection, or sibling rivalry in any home. Yet, few professionals have considered what the child has actually done to produce the antagonism in his parents or siblings or both.

Although no figures are available, heredity and prenatal, perinatal, and early neonatal factors must be considered since reports describe many of these children as exceptionally active, irritable babies, frequently with sleep problems. Many require little sleep and are head bangers or rockers, etc. Severe illnesses, infections or head injuries may be primary causative or additive factors in behavior disorders in children.

Symptoms

The symptoms may be either above or below the range of normal. The most usual complaint is hyperactivity. These children are in constant motion. They sit for only a few minutes and are off again. Activity in the younger children is purposeless and, although it is more organized in the older children, it is disruptive and destructive. Their movements are jerky and quick, and they appear clumsy and awkward. Choreiform, athetoid movements have been observed. They can't keep their hands to themselves, but must have them on others when not busy.

The next most frequent complaint relates to their social adaption. They have few or no friends among their peers and are pushed aside. They may be aggressive and instigate fights, but some won't try to protect themselves. They are followers with older children and will commit antisocial acts at their urging. They adjust well with younger children by being the boss. Behavior can be termed immature.

These children can be mean with rapid mood swings—temper tantrums or rage reactions. They are stubborn and defiant, then apologetic and remorseful, only to repeat the same antisocial or defiant act. Some seek approval and want to be told they are loved. They want to hug or kiss those in close proximity, but will hug with a death-like grip or suddenly pinch. Feelings are easily hurt and crying is excessive. They are easily frustrated and act out. Impulsive behavior may lead to stealing, lying, fire setting, and story telling which may be misunderstood as hallucinating.

Attention span is short and they are easily distracted. These children are slow to complete an assignment or fail to do so. Concentration is poor. They may be persistent, either verbally or in motor activity. Some tend to be perfectionists, redoing papers over and over and finally becoming frustrated and angry.

Learning disorders are frequent. Visual and perceptual motor problems may cause difficulty with reading, spelling, writing and arithmetic. The amount and degree differs with each child from day to day. They may do excellent verbal work and thus pass from year to year. They may have difficulty in recalling, abstract thinking, problem solving, and organization of work. Rote memory is good in the young child, giving a false image of mental brightness.

Other characteristics the parents elaborate on are development and habit formations. Speech may be slow to develop with difficulty in articulation. Hearing may have mild impairment in discrimination. Toilet training may be late with enuresis until late school age. Tactile sensations may be impaired in the younger child so he seems insensitive to pain, reckless, and unheeding of danger. Eating habits are poor with peculiar tastes, and picky appetites. Sleep-

ing habits are poor. They fight sleep, are restless and light sleepers, sleep walk, have nightmares, as well as fear of sleeping. On the other hand, in some children sleep may be very deep with little movement.

A small percentage of children may be hypoactive, quiet, withdrawn, and frequently considered depressed, and autistic-like. They, however, fidget constantly, play with objects or just with fingers, squirm but do not disrupt or disturb others. They seek the corner of the room and entertain themselves, seeming to live in a world of their own. Schulman, et al [2] put actometers on both types of children and found the hypoactive had as much movement as the hyperactive. Hypoactive children may seem sweet, shy, over-willing to please, too friendly, pleading for constant acceptance, and want to be fondled. Feelings are easily hurt with frequent crying. Other symptoms are similar to those found in the hyperactive child.

Diagnosis

The history may indicate some or all of the various symptoms, or only subtle symptoms which are difficult to obtain from overprotective or guilt-ridden parents. Parents may put all the blame on an uncooperative school system at first, but with understanding, they can be drawn out to discuss preschool problems.

The physical examination is usually normal but may show some minimal abnormalities, such as, dental developmental defects or mild congenital malformations, such as, hypertelorism, extra digits, webbed digits, abnormally shaped heads, and misproportioned ears.

The neurological examination may be grossly normal but often shows the soft signs of poor coordination of finer movements or gross movements, or confusion in laterality with frequent mixed or crossed dominance. Eye abnormalities are frequent with strabismus, nystagmus or poor vision.

Psychological examinations are most important and should be obtained on all children suspected of being brain damaged. High verbal but low performance scores are frequent. Low scores may be obtained in abstraction, comprehension, visual-motor, or perceptual motor. The test may indicate dyslexia. Those tests most likely to pinpoint the problems are the Wechsler Intelligence Scale for Children, the Bender-Gestalt Motor Test, Goodenough Draw-A-Man Test, and, at times, reading tests.

The electroencephalogram should be obtained in all possible cases. Just as in the individual with epilepsy, 25% of interseizure electroencephalograms are normal, so many of these children may also have normal electroencephalograms. Electroencephalograms may be borderline, minimally abnormal or grossly abnormal, as seen in those of epileptic individuals. During sleep, 6 & 14/sec positive spikes are very prominent in many of these tracings. A normal electroencephalogram has no significance, but an abnormal tracing can be an aid in medical treatment.

Treatment

Treatment consists of three phases: the medical management, counseling, and educational planning.

Medical: Any complicating medical condition should be treated or a program outlining the treatment plan should be made. This should include proper eye glasses, speech therapy, hearing aid, medication to control seizures, exercises to improve coordination, etc.

The management of behavior with medication is becoming more important as we learn that patients are responding favorably to medication. The medications used can be divided into five groups.

I. Anticonvulsants, except for the barbiturates which make most of these children worse. The electroencephalogram is an aid in indicating which anticonvulsant to use. Patients whose electroencephalogram shows an irregular slow pattern or the paroxysmal high voltage slow pattern respond best to the hydantoins, such as, diphenylhydantoin sodium *(Dilantin),* mephenytoin *(Mesantoin),* and ethotoin *(Peganone).* These should be started in small doses and gradually increased to a point of control or toxicity, except with diphenylhydantoin which should be given according to the individual's weight

If the electroencephalogram has spike slow wave, phensuximide *(Diamox), (Milontin),* ethosuximide *(Zarontin),* acetaxolamide then methsuximide *(Celontin),* trimethadione *(Tridione),* or paramethadione *(Paradione)* should be used.

In 1968, for a six-month period all school-age patients with behavior disorders seen in the Clinic for the Exceptional Child were recorded. Table 1 shows the correlation of the electroencephalogram pattern with and without seizures.

Table 1: Electroencephalogram Patterns With and Without Seizures

	Behavior	Seizure and Behavior
Irregular or slow	**23**	**11**
High Voltage Slow	**4**	**4**
Spikes	**8**	**3**
Spike-Slow Wave	**4**	**4**
6-14/second positive spike	**10**	**0**
Normal	**8**	**3**

Out of a total of approximately 300 cases, 109 children were so markedly improved in behavior that they were able to return to school and remain in school, after having been on suspension, or about to be suspended, for behavior. Table 2 shows the distribution of 109 children's response to the anticonvulsants. Children with 6 & 14/second positive spike pattern in sleep electroencephalogram are the most difficult to control with any medication.

II. Stimulants such as dextroamphetamine *(Dexedrine)* or methylphenidate hydrochloride *(Ritalin).*

III. Antihistamines, especially diphenhydramine hydrochloride *(Benadryl).*

Table 2: Medications Effective in Behavior With or Without Seizures

	Behavior	Behavior and Seizures
Diphenylhydantoin sodium	**48**	**30**
Mephenytoin	**3**	**0**
Ethotoin	**5**	**1**
Methsuximide	**8**	**4**
Acetazolamide	**8**	**2**

IV. Tranquilizers—many of the present tranquilizers have been found effective: Chlordiazepoxide hydrochloride *(Librium),* thioridazine *(Mellaril),* meprobamate *(Equanil, Miltown),* ectylurea *(Levanil),* chlorpromazine *(Thorazine)* and an experimental compound, mesordazine.[3]

V. Carbonic anhydrase, mainly acetazolamide *(Diamox)* used in doses of two to three grams per day.

Often a combination of two or more medications is more effective than large doses of one. In our experience, effective combinations have been diphenylhydantoin sodium *(Dilantin)* and diphenhydramine hydrochloride *(Benadryl),* diphenylhydantoin sodium *(Dilantin),* and thioriadazine *(Mellaril)* or all three.

Patience on the part of both the parents and the physician is a requisite, since it may take some time to determine which medication or combination of medications will be effective.

Our experience and the literature indicates that these drugs have an ability to effect a broad range of functions and produce varied benefits. Bradley's early work reports the rotatory amphetamine improved scores on academic measures of arithmetic.[4] Other studies report increased attention span and ability to improve reading rate. An oversimple explanation of the drug effects might be that they make the child more amenable to a learning environment. If the child is more controlled in his activity level—able to sit still, able to attend to a topic longer—it stands to reason he will be a better student.

Counseling. In all cases there is an emotional problem. Both parents and child need counseling. The adolescent being seen for the first time frequently needs psychiatric type of care. It is my belief that counseling can be a very useful adjunct to the treatment program. The "theoretical" approach to the counseling may be as eclectic as the chemotherapeutic. The description of behaviors associated with this syndrome indicate that short attention, span distractibility, and perseveration are part of the usual therapeutic approaches limited in applicability, but some of the newer concepts have shown promise. Behavior modification therapy and family therapy are two approaches that have been beneficial. The goal directed, controlled aspects of behavior modification have been most helpful. These children have experienced great amounts of frustration in academic, social, physical, and athletic areas, and as a result, may evolve a defensive system that makes them "failure-avoiding," rather than "success-striving". In action, these children avoid or disrupt a task so that they don't have to face the prospect of failing it. The therapeutic approach is to organize the efforts of the child, family, teacher, and therapist into a series of projects or programs that will produce successes and modify behavior by teaching new responses. The family approach is stressed in treatment because these parents are routinely confused about how to handle these children—to punish or to bribe, to ignore or to praise—and they usually state, "We've tried everything." This is probably true; they have tried many things without a well conceived plan, without reasonable steps and a commitment to persevere. If this child has trouble learning in school, it is reasonable to assume that it will take repeated efforts to teach a behavioral response. Every failure—be it poor planning, inability to stick to the plan or an outright accident—reinforces the wrong response and will require time to extinguish before the right response is learned.

Education Planning. Recognition of the perceptual-visual motor handicapped child in the preschool years helps in planning an educational program geared to his needs. Even though medication may make him easier to live with and reduce the emotional overlay, the perceptual and visual motor problems are still present. Special educational programs are needed for many, while some may only need intensive remedial reading. Others will need a kinesthetic training program, of which there are several types. All of them aim at teaching by simultaneously using hearing, sounding or saying; feeling and making by tracing, printing or writing the letters of the alphabet and numbers. Other tasks involve learning to match objects, colors, and diagrams.

Physical exercise to improve coordination should not be overlooked. Gross and finer movements should be practiced, making a game of it. The exercises should slowly increase and become harder as he successfully accomplishes each task. He must gain the feeling of success so he can better compete with his peers. Such programs are already in operation and have had interesting results. In one study, it was noted that academic performance, as well as physical performance was improved.

the *Adolescent* TURMOIL

GHISLAINE D. GODENNE, MD
Associate Professor of Psychiatry
The Johns Hopkins University School of Medicine

It is hard to put in writing an extemporaneous talk when so much of one's presentation involved examples from a long and busy practice with teen-agers. However, this paper will attempt to give an over all view of the subject of "adolescent turmoil." For sake of clarity, one should first define the limits of the adolescent period. Adolescence is a period of life ranging from puberty to adulthood. Although the age of puberty is relatively easy to determine, the one of adulthood is rather vague: one can set it at 18, 21 or 25, 45!—never! Arbitrarily, at The Johns Hopkins Hospital Adolescent Clinic, we have set the upper limit of adolescence to 21 years of age—the age at which an adolescent becomes legally independent from its parents. However, we exclude from our adolescent clinic young people who are married, who are financially and geographically independent from their parents, or who are in the armed service. This definition of adolescence has several corollaries. In this time of national prosperity, there are more adolescents since more young people can pursue studies and remain financially dependent on their parents. One can also understand how more of the older adolescents belong to the higher socioeconomic groups.

Having delimited the adolescent period, let's look at what makes it a period of turmoil. Adolescents go through many changes, both physical and psychological, which create inner tension and are sources of anxiety. If the tension becomes too great, the adolescent has difficulty tolerating it and tends to act it out, which explains the rather erratic behavior exhibited by so many teen-agers.

Physical changes are experienced with anxiety. The sudden growth, for instance, at the beginning of puberty requires from the adolescent a reworking of his body image. Also the simple fact that every teen-ager doesn't grow the same amount or at the same time results in marked difference of sizes among them, and causes the small or tall adolescent to feel odd. The apparition of the secondary sexual characteristics is another physical change which brings with it a considerable amount of inner feelings. In getting used to his new body configuration, the teen-ager compares his rate of change to the one of his peers. He suffers intensely if he matures very early or very late: Who of us hasn't run into a boy asking to be dismissed from gym, for instance? Such a request is often made by a teen-ager who feels that his genitals are smaller than those of his peers. He is afraid to be laughed at by his peers when, after gym, he can be observed while taking a shower. A girl who is late menstruating also experiences great concern about her future womanhood. In addition to these observable physical changes, it is felt that the hormonal rearrangement, which occurs in puberty, gives the adolescent a feeling of strangeness, of general malaise which could be at the basis of the increase in hypochondriacal complaints during adolescence.

While all this is occurring physically, the adolescent has to cope with additional, difficult, psychological problems. At the onset of puberty, the aggressive and sexual drives are markedly intensified. They have to be kept in check by an ego, which is already overwhelmed by the problems it has to solve. This often gives the teen-ager a fear of going crazy, going out of his mind, and in some instances, a weak ego can disintegrate and, thus, lead to a clear cut psychosis. In addition to the increase in drive energy, specific psychological issues have to be coped with in order to reach adulthood: The teen-ager has to move from a dependent position to an independent one. He himself must find the answer to the question, "Who am I?"

The shift from dependence to independence is a hard one, as both positions are very appealing. To give up what one has and loves (dependence) for something that one yearns for (independence) is a hard task, and this is the basis for so much of the adolescent's behavior. Billy's swing of mood for instance, so typical for a teen-ager, can be explained by a nonverbal communication between him and his mother. If Billy is good, obedient, and attentive, mother conveys to him the feeling that she hates to ever see him grow up and leave home. Billy reacts to this by being difficult, obnoxious, and loud. He wants and needs to grow up, but now he senses the maternal rejection, the wish of seeing the day come when he is on his own. Being frightened and unprepared to face the separation from home, he becomes once more the complacent little boy and the cycle starts anew. The "run away" adolescent is often one who has difficulty breaking his dependency ties, so he does it quickly in order to get it over with. The adolescent who rebels against any and all parental or adult limits is also an adolescent who is trying to establish his independence.

The second major task that needs to be worked through during adolescence is the identity issue. At the end of adolescence, the difficult question, "Who am I?" has to be answered. The various identifications made during adolescence have to be worked into one harmonious unit—"me." They have to be synthesized into a consolidated personality. They have to lose their tag of origin and become part of the young adult's personality. If the adolescent fails to do this, he will suffer what Eric Erikson calls an identity diffusion. The sexual identity crisis is a separate issue which is more marked for teen-age boys than for the adolescent girls. A girl can remain bisexual longer than a boy. She can be a tomboy and a sweet little party girl without awakening too much concern. A boy on the other hand has to be all boy, if not, he risks getting teased and berated by his peers. The boy who is not sure of his masculinity might want to act masculine to prove to himself and to the world that he is a man. This assertion of masculinity is seen, for instance, in the boy who fights continuously or the boy who becomes sexually promiscuous. The sexually promiscuous teen-age girl is motivated more often by her need to be loved and cared for, than by her need to prove her femininity.

For the teen-agers, the adults and children belong to a different world. The teen-ager, thus, needs to belong to a group of his peers. With his peers, he can feel understood and can share the miseries of the period he is going through. An adolescent who has no peer relationships should be a matter of concern.

For us adults who look at the struggling teen-ager, how can we best help him? We have to set few but firm limits. To avoid arbitrariness, the teen-ager should be involved in the setting of the limits and the sanction for their transgression should be discussed with him too. Limits should be set only in important matters. This will make authority more meaningful to him and reduce the opportunity for friction. Adults should be consistent and united in their decisions regarding teen-agers. They should listen to teen-agers and try to understand them.

In psychotherapy, the teen-ager should know that he is the patient. So, he should be seen before his parents and, preferably, before getting any information about him. His parents should be seen only by his therapist at the beginning of treatment in order to get additional history. The therapist should try at all times to remain the teen-ager's confidant without ever becoming his accomplice.

GRIEF AND DEPRESSION IN OLD PEOPLE

ROBERT D. PATTERSON, MD
Psychiatric Consultant
Section on Mental Health of the Aging
Division of Special Mental Health Programs
National Institute of Mental Health

Grief and depression occur to people at all times through their lives, but these conditions are special problems for old age. Much can be done to ease the pain of depression and help people complete their grieving.

Normal Grief

One of the frequent and difficult tasks of old age is grieving. It is a normal and necessary process which old people must go through more often than younger people, because they lose more loved ones through death.

A classic description of acute grief was written by psychiatrist Erich Lindenmann (1944)[1] who treated 101 patients experiencing acute grief, many of whom had lost family members in the famous Coconut Grove nightclub fire in Boston, in the early 1940's. A large number of the survivors, who were admitted to a general hospital, were simultaneously experiencing grief over the death of loved ones who had been with them at the nightclub. His description of their grief included somatic distress, preoccupation with the image of the deceased person, guilt, hostile reactions, and loss of usual patterns of conduct. The descriptions of cases which follow illustrate most of these normal reactions in grief. The somatic sensations he described were tightness in the throat, shortness of breath, an empty feeling in the abdomen, and weakness. The hostile reactions he described can be very puzzling and difficult for the physician, especially when his patient dies and the family's angry reaction is turned on him. It is comforting to know that such feelings have been described in healthy people during their grief after the Coconut Grove disaster. With that realization, the physician is less likely to become defensive about the family's accusations, and more likely to react helpfully to someone temporarily overwhelmed by grief.

An example of the loss of patterns of behavior is that of a man who, a few days after his wife's death, got up in the morning and wandered aimlessly around the house, unable to carry on his usual routine because his wife was gone. Without her, his old pattern of putting on coffee for them to drink while she fixed breakfast became meaningless.

Grieving is the gradual process of destroying the intense emotional ties to the dead person. The best example of this process is the intense, sad feeling provoked by thinking of the dead person. Each time this happens, it gets the sad person a little closer to being able to think about the dead person without being overwhelmed by feeling. The funeral and visits by friends to the person in mourning provoke sad memories and, thus, help in the process of grieving while giving support to the sad person. However, the process of grieving—sometimes called the grief-work—goes on for months after the loss. After her husband's death, a widow may go through his clothes and belongings in preparation for giving them away. Here, too, she is doing her work of grieving. Many of the pieces of clothing she looks at will stimulate an intense image of her deceased husband and feelings about his death.

Restitution

Breaking down the intense emotional ties to the deceased is only one part of grieving, however. The other part is making restitution for the loss. Sometimes the loss can be partly made up by a new spouse or friend or renewed closeness to a child. Other kinds of restitution are also needed. For example, a widow who had regularly gone out with her husband and another couple was never invited out by them after her husband died. She had to realize that the other couple really only liked her husband, and so they were not interested in her any more after he died. She had to struggle with this painful realization and develop new friendships of her own. A person who does not accomplish grieving will remain sad and withdrawn and can be appropriately diagnosed as depressed.

There are specific things that can be done to help patients who are grieving. By encouraging them to talk with you and others about their loss you can discover how the patient is handling grief. If she seems not to understand the need for grief-work, a comment that thinking and talking about her dead husband is a necessary part of recovering from the shock of his death, and your sympathetic recognition of what hard work this is, may enable her to think about it and to continue grief-work with others after she leaves you.

Sometimes family members try to "protect" someone from doing their grief-work by not mentioning the dead person. They may need our help to realize that they can really help by talking sympathetically with the sad person about what it feels like to be grieving.

There is a natural tendency for people to avoid those who are bereaved or depressed. The same tendency operating in us makes it hard work to talk with such patients. A psychiatrist may find himself getting very interested in hearing more about the old lady's Oedipus complex at age five, or a general practitioner may become concerned about the complexities of her PBI. We must each be cautious that we are not avoiding the hard work of helping the patient cope with sad feelings.

If grief-work could be accomplished in more people much chronic unhappiness could be reduced. It is common to see people who still get tearful at mention of a lost person years after the death. This represents still unfinished grief-work. It is fortunate that in such cases of unfinished grief-work even years after the loss, discussions about the relationship to the lost person can lead to a successful completion of the grief-work.

Old people more often than young people have experienced the death of their parents and, in the process, have learned something about grief-work. Asking how they accomplished mourning these losses may remind them of resources to use again and may bolster their confidence through recognition that what they must do now is something they have already done earlier.

Depression

Sometimes the breaking down of emotional ties to the lost person and restitution for the loss is not accomplished; in that case there is depression. Although there are many causes for depression in old age, feelings of hopelessness and helplessness are the essential features of all depressions. While it seems as though this should be easy to spot, depression can be surprisingly hard to identify. There are several reasons why it may be overlooked. First, the patient comes to talk about some physical illness and the subject of feelings just does not come up. (Hypochondriacal symptoms can be a tip-off to look for depression.) A second reason depression may be overlooked is that the patient, even when asked, may not realize that he is depressed or he may not be able to admit that he is feeling depressed. He may not know what to call his unpleasant feeling or be trying to use an "ignore it and it will go away" approach.

A third reason depression may be hard to identify is that sadness, apathy, and quietness may be mistaken for senile changes. In medical school we were taught the aphorism "All that wheezes is not asthma." We might coin one for geriatric psychiatry to the effect that "All of the problems of old people are not chronic brain syndrome." The distinction between organic impairment and depression is important because depression requires special treatment. If it is not differentiated from organic changes, it will go untreated. The patient may have both organic deficit and depression, but the presence of organic deterioration should not discourage the attempt to find the cause of the depression and treat it.

When a patient is suspected of having organic deterioration, the examiner must force himself to become rigorous and to list just what signs suggest organic mental change. For example:

Did he say his memory is failing or that he cannot think as clearly or as fast as he used to?

Did his memory fail in specific instances?

Was his thinking less clear and less quick than would be expected for a person with his experience?

Did he fail to understand instructions?

Did his mood change quickly and unpredictably? For example, did he cry without feeling sad?

Each of these points *can* be good evidence for organic deterioration. If the patient has some of these signs, an organic brain syndrome may be present. Then a differentiation from depression must be made. Some points to consider are the following:

Did he think he was depressed and did he seem sad when he talked?

Did he have a sense of helplessness and hopelessness?

Did he insist that he is ill or deficient or defective without evidence?

Was there a current cause for him to be depressed?

Was he slowed up in all of his mental and physical functions as a result of the depression? This slowing up might, at first, be mistaken as evidence for organic deterioration.

If there is clear evidence of failing mental function and no depressive symptoms or other major emotionally upsetting situations which would account for it, an organic brain syndrome is likely.

In agitated depression, the sadness and sense of hopelessness and helplessness are present along with tension, agitation, insomnia, and feelings of worthlessness.

Depression may be the most prominent symptom in some physical diseases, and so identification of depression may indicate the need for physical diagnostic tests. Cerebral ischemia, an otherwise silent brain tumor, endocrine imbalance, or vitamin deficiency, such as in pernicious anemia, may be causes of depression which should be ruled out.

If a history is taken carefully enough, the cause of depressive feelings can almost always be discovered. Often family members can be invaluable in establishing the onset of depression and suggesting what the cause is. We must suspect that we don't know enough if our formulation of why the person is depressed is still fuzzy.

An example comes to mind from a longitudinal study that I have participated in involving normal aged men. I reviewed interviews made several years ago. In one interview, the subject was depressed but I could not satisfy myself that I knew why. I thought about the fact that he had recently retired and might feel a loss of status by not having a job anymore or that he felt he had not been much of a success in life and now his chances for success at work seemed to be over. But none of these seemed to be the specific cause. From talking with another person who knew the man at the time of the interview, I learned that he was worried about a possible carcinoma of the prostate for which he was being treated. I looked again at the interview and then could see that he had mentioned this treatment and that he knew it was sometimes used for carcinoma but he denied that he was afraid of having cancer. His depression was treated incidentally when the study team recommended a biopsy of a nodule in his prostate which turned out to be benign. It became clear that he was depressed because he suspected

he had a fatal illness. This incident emphasized that persistence in looking for a convincing reason for depression will be rewarding in most cases.

Common Causes of Depression

Causes of depression are innumerable, but only a few kinds of problems are the cause of a large number of depressions. Among the most common causes of depression is loss of an important person, usually through death, but sometimes through children moving away or estrangement. Treatment may focus on completing the grief-work, of accepting living without the loved one and finding new people and new interests or reconciling the estranged people.

Not all losses are losses of people; they may be losses of things or hopes. An example is depression precipitated in an old person by his having to move because of urban renewal from a home after having lived there for many years. Depression associated with relocations of old people is only part of a complex phenomenon, which leads to increased mortality when old people are moved. It appears that preparing the person emotionally for the move can reduce the incidence of death following moves. An example of a feeling of loss because something expected did not come about is that of a man who hoped to live in retirement on income from the sale of his business, but the person to whom he sold it closed the store and could not keep up the payments.

Retirement is a usual cause of turmoil in the lives of old people and it frequently causes depression. Sometimes retirement represents closing the door on hopes for achievement which have not come about. Forced retirement may make the person feel suddenly old and useless. Helping the person put problems like this into words—perhaps through suggesting possible explanations if he cannot find reasons by himself—may start a process of thinking in the patient which he can carry on at home to his great benefit.

Physical illnesses often lead to depression. Misconceptions about an illness can be very easy to clear up if recognized. For example, a very passive man had the idea he was going to become blind from an inherited eye defect. He did not seek any follow-up from his doctor, but made plans for the time when he would be blind—including taking a job in a darkroom where a blind person could function as well as a seeing person. He came for psychiatric help because he felt chronically depressed and apathetic. His expectation of going blind seemed, to him, just another fact in his life—he did not realize the tremendous importance of this idea on himself. Treatment consisted of referring him to an ophthalmologist who said there was no reason for him to expect blindness. He needed no other psychiatric treatment.

Real illnesses that lead to debilitation and death are more difficult to cope with. Patients have highly personal reasons for being depressed when they are physically ill. One patient's fantasies may be worse than what is reasonably expected, and he can get great relief from discussing them. Another man may be depressed because cancer makes him dependent on his wife, while feeling independent was something in which he always took great pride. A woman may be ready to accept her own death, but depressed at the prospect of her chronically ill husband having to live without her. Still another patient may be depressed because he feels he will break down when his illness becomes painful, so that he will disgrace himself. Many of these problems do not have very satisfying answers, but exploring the causes of the feelings can in itself be a great relief to the patient and may get him started to work finding solutions.

Treatment

A Case Example: Almost all psychiatric symptoms in old people will be helped by talking—talking with the patient or sometimes with the family. Sometimes medications are useful, but they are often of secondary importance.

A 66-year-old man was treated with talk and drugs when he developed an agitated depression. He had always been single, eccentric, isolated, and had no family close enough to him to be of help in a crisis. When first seen he had not been to work for two weeks. He worked as an overhead crane operator in a large welding shop. He said he could not work because he could not see clearly. A physical examination showed no cause to explain his symptoms. He was very tense, fidgety, had jerky movements of his upper body, and winced frequently. He was not inclined to talk about feelings or be introspective, but between his descriptions of his eyes and other somatic complaints, he made it clear that he was very depressed and hopeless about his situation. Being unable to work was making him panicky about his future. Unfortunately, it was never possible to get the type of clear understanding of the cause of his depression which is recommended. Two medications were prescribed within a few days—a tranquilizer and an antidepressant. As he started the medications he was seen twice weekly for about 10 to 15 minutes. He liked to talk longer, but it would not have been helpful, and while he was an interesting and likeable person, it would have been easy for the psychiatrist to get too much of his repetitive talk and become angry with him which would have been very detrimental to the developing relationship. He protested that the medications were no help, but he was urged to keep taking them as it might take several weeks to get a good effect. He openly doubted this was going to succeed but kept his appointments and took his pills. By the end of four weeks, his dose of antidepressant had been increased to the maximum recommended with still no effect. An important point

is that the dose was gradually increased to the maximum recommended and maintained for the three weeks that the slower acting antidepressants sometimes require. It probably was possible to keep him in treatment through this long wait for results because he was seen twice a week and listened to sympathetically when he talked about his somatic complaints. The next week he began to feel better. He felt energetic and optimistic. He quickly went back to work. It was thrilling to hear him describe how the men in his plant applauded as he started to climb to the cab of his crane the first time he was back. (One reason they liked him so much was that he always brought about 30 candy bars with him which he threw down to the men working below him for them to eat.)

The success of this therapy depended upon the relationship fostered with the patient in which understanding of his plight was demonstrated, particularly by seeing him often, even though not for long visits. Besides providing a sympathetic ear, it was undoubtedly this demonstration of concern that persuaded him to keep taking the medication until it became effective.

Utilizing Community Facilities

The patient described required a modest amount of a doctor's time to treat, but there are patients who require large amounts of time. Here community facilities, where they are available, can sometimes be used. Many of you practice in areas where clinics and social service agencies may not exist at all. Community mental health centers within a few years may make such services available. However, it is impressive that people over 65 make up 19% of all admissions to State and county mental hospitals, and yet they make up only 2% of all patients admitted to psychiatric outpatient clinics. This suggests that especially for older people, greater use of community facilities of many types—not just psychiatric outpatient clinics—could reduce the number of old people who reach crises that require hospitalization.

Increasing our utilization of golden age clubs, friendly visitors groups, family service agencies, or homemaker services, etc., may involve defining our role as doctors a bit differently from the way we have in the past. By making frequent use of such resources, we include in our definition of our role, for example, helping a widow adjust to her husband's death through directing her to community resources.

Among the facilities are family service agencies in several areas of Maryland which offer services of social workers who can counsel on emotional problems. For example, suppose an old woman who lives with her daughter and son-in-law is deteriorating physically or mentally and apparently will need institutionalization, but she wants to continue to live with her daughter. The daughter sees the strain placed on her marriage by the great demands her mother makes, but she cannot bear to see her mother sent to an institution. Helping the mother and daughter understand what is going on and what should be done will likely take a lot of talking. A family service agency social worker can be of great help with this kind of case.

Visiting nurses and public health nurses can be called on to help with some psychological problems.

Do you have old patients who could benefit from frequent regular phone calls from someone who will check to see that the patient is all right, at the same time providing a friendly link to the world outside? Such a service is available through several of the County Commissions on aging in Maryland. Washington County has a Friendly Visitor Service, and Montgomery County is about to start one. Ten senior citizen centers are operating in the State, as well as many Golden Age and similar clubs.

When you are lucky enough to have a new community facility in your area, you then need to find the proper place for that asset in treatment plans so that when the patient comes in you will automatically think of the facility that can benefit him. Referring patients to such facilities and seeing what results you get will be the best guide. Your participation in the formation and direction of local facilities can be of great benefit through helping others be more aware of what the needs are from your point of view.

Many old people are not getting the community agency help they need. Some reach a crisis and must go to total care institutions. There are not enough community-based helping agencies, but probably we can use the ones we have more than we do now.

Summary

Normal behavior in acute grief includes somatic distress, preoccupation with the deceased person, guilt, hostile reactions, and loss of usual patterns of conduct. Ways of helping people accomplish grief-work and restitution for their losses are discussed. Depression may be a diagnostic problem because it is easily overlooked in the old patient or mistaken for organic mental decline. The importance of finding the cause of depression is emphasized and treatment techniques are discussed. Greater use of a wide range of community facilities for help with emotional problems of old age is urged.

SOME MEDICAL AND SOCIOLOGICA

The major health problems of our cities are essentially the health problems of the poor. The cities contain a large percentage of the rich, but they also contain 54% of the poor. Many of the latter are black, and although the majority of the poor in America are white, the nonwhite are twice as likely to be poor as the white.

M. ALFRED HAYNES, MD
Project Director
National Medical Association Foundation

Many of the large cities show what has now become a fairly monotonous trend. In the center of the city is the poor, black community, usually living in dilapidated row houses surrounded by uncollected garbage, or imprisoned in housing projects which could stifle any spark of human dignity. This core is surrounded by a white, much wider circle of middle income people living in detached houses or high-rise modern apartment buildings, often surrounded by beautiful lawns. On the suburban periphery, there is an almost lily-white circle of higher income people who retreat into beautiful, modern homes surrounded by neatly trimmed lawns. A visitor from outer space, where everyone is supposedly green, would find this to be a very unimaginative illustration of our modern art.

Poverty and social injustice have combined to create the most scandalous and shocking health conditions in our cities, in this richest and greatest country in the world. Some of these problems are evident in the vital statistics of our cities. In Washington, D. C., there are more than 2,000 excess deaths in the black population each year. This excess is computed by assuming that the age-sex-specific death rates of the white population for the year 1966 had applied to the nonwhite population.[2] In this case, the actual number of deaths exceeded the expected number by 70%. In the city of Baltimore the observed number of deaths exceeded the expected number by 50% during the same year. In 1960, the excess in Baltimore was 40%, indicating that the situation has actually deteriorated in recent years.

The differential between white and nonwhite does not tell the whole story. For example, in Washington, D. C. there is a wide economic spread in the black population. If the health status of the poor, black population were compared with that of the middle income, white population of the city, the differential would be even greater.

The specific causes of death which contribute to the wide differential include such conditions as, the diseases of early infancy, accidents, pneumonia, cardiovascular diseases, cirrhosis, diabetes, and homicide. Clearly, many of these conditions can be prevented by the application of medical knowledge which is currently available. Others, such as homicide, are less amenable to the usual medical approach, and progress may depend upon a substantial change in the social environment of our cities. To the extent that the deaths are due to conditions which are rectifiable by either medical or social means, they can all be considered social homicide and the burden rests upon our entire society.

Deaths are the clearly observable and easily defined tip of the iceberg. But for every death by accident, there may be 100 cases of illness or disability. For every death by cirrhosis there must be numerous cases of alcoholism, which represent a great economic and social burden. Tuberculosis has not yet been eradicated and venereal disease is on the increase.

With all of these problems, the inner-city residents find it difficult to obtain health care. The doctors, like the churches, are leaving the inner city. Hospitals do likewise. The transportation system is in conspiracy with the health care non-system to de-

In general, the poor have 5 times as many heart conditions,
6 times as much arthritis and rheumatism,
6 times as much high blood pressure,
and 8 times as many visual impairments.[1]
It is unfortunate to be poor,
but to be poor and black is to carry a tremendous burden
of increased morbidity and mortality.
This is the group which forms the heart of our cities.

prive the mid-city residents of access to health care. In Watts, there is a common saying that the transportation runs east and west while the jobs run north and south. In some cases, the indigent or the medically indigent must travel across the entire city, bypassing several private hospitals in order to be treated at the city hospital. In practice, unlike in theory, freedom of choice does not usually extend to the poor. Occasionally, one section of a city must riot before it can get a hospital. Another city must riot before it can persuade a medical school from expanding in such a way that it deprives the poor of housing. The only real freedom which the poor seem to have is the freedom to destroy.

Many of the problems are essentially due to our own failure to understand each other. The health economist talks about the billions which the government spends for health care. This means nothing to the mid-city residents who consider what they get as not worth a dime. The university treats the patient as "interesting clinical material" when the patient wants to be treated as a human being. The health department is more interested in disease and the prevention of disease than it is in people. As a result, there are a multiplicity of categorical clinics, but very few centers for comprehensive care. We are so closely wedded to the concept of charity medicine that we cannot appreciate the fact that some people do not want charity.

This assessment is not intended to ignore the many attempts which have been made to solve some of the problems. The results sometimes appear to be inversely proportional to the efforts, and the efforts have been many. The Office of Economic Opportunity has developed neighborhood health centers where the poor can obtain comprehensive health care of a high quality. Although the services are offered to a small segment of the population in need, this segment, usually referred to as the "target population," could receive some of the best care available anywhere in America. The kind of care offered under these circumstances could almost encourage belief in the common myth that the poor receive better care than the middle-class. There are two problems, however. The demands for personnel for these programs have been so great that, if they were met for the target population, this itself would accentuate the crisis for the rest of the poor. In an attempt to provide high quality health care for a few, we cannot deprive the many of the little which they would otherwise receive. This situation could be partly alleviated by an imaginative use of nonprofessional personnel which could, in turn, benefit all. The second problem is equally serious. Health care, which is segregated to the poor, will carry the stigma of inferior care, regardless of the quality offered. The black poor have had many years of unpleasant experiences under the doctrine of separate but equal. They have, therefore, learned to be suspicious. The provision of comprehensive care for the poor under a separate system is better, as a short term objective, than no care at all. But, as a long term objective, Americans can hardly be satisfied with anything less than a single system of health care with equal access to all.

The Medicaid program has the potential for re-

moving the economic barriers for the poor, and permitting access to a single system of care—but this is so only in theory. Some physicians cooperate but many do not. The reason why some do not cooperate is because some states are committed to preserving the two class system. The fees for Medicaid patients are fixed substantially lower than those received from private patients. In Maryland, the fee paid to the private physician for an office visit is less than half of that which is paid to the hospital on an out-patient basis. This can hardly be considered fair, either to the patient or the physician. Even at this rate, a few physicians have been able to do well financially through the program because a large proportion of their patients fall into the Medicaid category. Those physicians who perform this service should not be penalized as long as they are providing adequate care. There are some physicians who are unwilling to serve Medicaid patients at any fee. These are the ones who deserve our criticism. Another group who deserve our censure are those who willfully exploit the system. These physicians do us and the patients a disservice, but it should be remembered that this group represents not more than 1% or 2% of the physicians serving Medicaid patients.

The hospitals are now carrying a disproportionate share of the burden of providing primary care. This is unfortunate, not merely because it is provided at higher cost, but because hospitals are not the proper place for providing most primary care. Poor patients, like everyone else, deserve the personal care of a physician, and institutional care is a poor substitute. There are no compassionate institutions. Most primary care offered by the hospital clinics should be considered an improper use of the hospital, and at best a necessary evil. The trend towards hospital centered care may seem desirable from the point of view of the administrator, but from the point of view of the patient, the center for care should be the personal physician's office. Ideally, health care is a very personal matter. Purchasing health care is not the same as going to the supermarket. Many of the problems which have arisen in our cities, have occurred because the poor realize that so often they must deal with people who do not really care. The general practitioner has traditionally been respected by our society because *he* does care.

Obviously, there is no simple single solution to these rather complex problems. A pluralistic approach is most likely to yield best results, at least for the present. In this case, the private physician will continue to play an important role, either in solo practice or in groups. Although group practice seems to offer many advantages for both physician and patient, there is still room for the solo practitioner, and he is likely to be with us for some time. Better results can be achieved if the traditional type of group practice, consisting primarily of clinicians, were combined with the best preventive aspects of the neighborhood health center. In this way, one could remove the barriers between private and governmental medicine, and provide services in a single system of care. A fair amount of suspicion on both sides still prevents us from achieving this goal.

The poor of our urban communities have had a dream—a dream which our government and our Constitution may well have inspired. They dream that someday they will have one nation indivisible, and this applies also to health care. It is not pleasant to consider what will happen in our cities if that dream is not realized. Langston Hughes raised the question in these words:

"What happens to a dream deferred?
Does it dry up like a raisin in the sun?
Or fester like a sore—and then run?
Does it stink like rotten meat?
Or crust and sugar over—like a syrupy sweet?
Maybe it just sags like a heavy load.
Or does it explode?"

The general practitioner can in his own way do a great deal to prevent this dream from exploding.

your medical faculty at work

by John Sargeant
Executive Secretary

The Executive Committee of the Faculty met on July 24, 1969, and took the following actions:

1. Authorized redrafting of current policies in respect to laboratory referral services.
2. Authorized legal counsel to appear as *amicus curiae* in a Court of Appeals case in connection with acceptance of testimony of a chiropractor as a "medical expert."
3. Was informed that there were no legal restrictions in connection with development of legislation or regulations that would prohibit all unethical practices by all laboratories.
4. Adopted the following statement to be distributed to chiefs of staff at all general hospitals in Maryland:

   When services at a hospital in Maryland are temporarily suspended because of conditions beyond the control of that institution, thus necessitating the transfer of the patients to another hospital for their medical care, it is recommended that hospital staffs adopt the general policy that all physicians who have privileges at the hospital that is forced to temporarily cease operations be automatically granted courtesy privileges at the hospital to which their patients are transferred or admitted; with the understanding that such courtesy privileges would be granted on the same basis and conditions under which they were granted at the closed hospital.
5. Referred the following matters to the Faculty's Liaison Committee for consideration and report to the Executive Committee: use of a recorded telephone device by physicians referring patients to hospital emergency rooms, and the question raised by the General Assembly regarding physicians making house calls.
6. Submitted various names to the AMA Board of Trustees for consideration for appointment to various AMA Councils and Committees.
7. Agreed to ask the Deans of Maryland's two medical schools for suggestions of names for submission to the US Pharmacopeial Convention Nominating Committee for its consideration. The individuals could be elected to the 1970-1980 Committee of Revision.
8. Approved appointment of the following individuals to the Medical Advisory Board of the Department of Motor Vehicles:

   Maxwell N. Weisman, MD, Psychiatrist
   Katharine V. Kemp, MD, PM&R.
9. Designated **Katherine H. Borkovich, MD,** to act as Faculty representative to an AMA conference on "Utilization Review by Peer Mechanism," scheduled for Saturday, November 29, 1969, in Denver, Colorado. The Faculty will pay expenses in this regard.
10. Designated **Robert J. Wilder, MD,** as Faculty representative to serve on the Emergency Care Advisory Council of the State Health Department.
11. Agreed to recommend to the House of Delegates honorary membership in the Faculty for **William Kouwenhoven, PhD,** who was recently granted an Honorary MD degree by The Johns Hopkins University School of Medicine.
12. Authorized a contribution to the Maryland Medical Political Action Committee for educational purposes.
13. Heard a summary of the activities of the Columbia Hospital and Medical Foundation in Columbia, Md., by **Harvey Minchew, MD,** and **Harvey Katz, MD.**
14. Heard and referred to the Policy and Planning Committee a suggestion from **William J. Peeples, MD,** that the faculty sponsor and approve a proposal for medical care to Maryland residents involving a "medical district" concept.
15. Accepted a report of the Ad Hoc Committee on Admission of Patients to Coronary and Intensive Care Units, which is repeated verbatim at the end of this report.

16. Discussed and concluded that no further action is needed in connection with a question raised regarding Blue Shield's handling of a fee dispute between a nonparticipating physician and a federal employee.
17. Received the second working draft of the JCAH Standards and learned that suggestions of the Maryland physicians who attended this working session in Chicago were incorporated into this second draft.
18. Endorsed the idea that the Faculty should employ a consultant, well versed in economic matters and capable of compiling statistical meaningful information on cost of living, physicians' fee increases, and other data.
19. Agreed to ask the two medical schools in Maryland to again consider the question of including courses on socioeconomics of health care in the curriculum.
20. Heard that the Social Security Administration at Woodlawn had requested and received the names of 33 physicians who had received more than $25,000 in one year under the Medicare Program.
21. Declined to make a financial contribution to the Man-Alive Program, in line with Faculty policy regarding such contributions.
22. Authorized appointment of a special group to prepare a charter or bylaws for the formation of a nonprofit corporation to develop the Hearing and Vision Screening Survey Program.

Report of Ad Hoc Committee on Admission of Patients to Intensive and Coronary Care Units

In this age of subspecialization, more and more hospitals are utilizing special care facilities. It is recognized that individual hospitals may have various specialty units and may have different problems, or approach the same problem in different ways. It is the desire of this committee to recommend general principles rather than restrictive, specific edicts. For example, a mechanism for determining admissions and discharges should be set up in each Special Care Unit (CCU, ICU, etc.). In this broad context, the following guidelines are suggested:

Special Care Units

CORONARY CARE UNITS

1. A CCU should be supervised by someone with special training or interest in cardiology.
2. Each hospital medical staff should establish its own criteria for CCU privileges. These criteria may include:
   (a) training and experience
   (b) special courses or instruction
   (c) availability
3. If an attending physician meets qualifications for CCU privileges, he may treat patients himself, or elect to transfer them to someone else with CCU privileges.
4. Admission of a patient to a CCU implies agreement by an attending physician that standard treatment may be employed, but medication or treatment varies as emergency circumstances dictate.
5. This committee, in principle, is opposed to a physician meeting qualifications for CCU privileges, being compelled to transfer his patient to another physician with CCU privileges.

INTENSIVE CARE UNITS

1. It is recognized that ICU patient population may embrace multiple specialties and no one physician could logically be expected to supervise the specialized care of every ICU patient. An ICU may be supervised by a director or by a committee or both. In either event, this direction would be mainly in an administrative capacity, as well as being available for emergency situations.
2. Hospital medical staff may elect to establish special criteria for ICU consulting or admitting privileges.
3. Admission of a patient to an ICU implies agreement by an attending physician that treatment or medication may be as varied as emergency circumstances dictate.

Rehabilitation of Patients Suffering from Fracture of the Hip*

Part III:

Treatment by Prosthetic Replacement of the Femoral Head

JOHN D. HSU, MD
Div. Orthopaedic Surg., Dept. Surg.
Baltimore City Hospitals and
Johns Hopkins Medical Institutions

The introduction of the prostheses for the replacement of the femoral head has been a major development in the treatment of the subcapital fracture of the hip. Only in the past two decades has success been achieved with this method. R. and J. Judet developed and used the acrylic, plastic "stem" type prosthesis. They demonstrated that replacement of the femoral head with an artificial one for certain problems of the hip was not only possible, but gave beneficial results.[1] Moore, independently, using structural and engineering principles, developed the "medullary" type of prosthesis. It was made of an inert material, Vitallium, which has been shown to be well tolerated by the tissues.[2]

* *Supported in part by an American Geriatrics Society Award and USPHS Grant No. 5T1 GM00624-08.*

With such developmental successes, the use of the hip prostheses then became widespread and was no longer used for experimental or heroic measures, such as the need for replacement of the femoral head for massive bone loss.[3] With careful analysis of the results over the past 20 years, the prosthesis has become a well accepted and powerful tool in the armamentarium of the orthopaedic surgeon.[4-6] Modifications and developments have produced variations of the two basic types, many of these are in use today. The change from acrylic to metal has guaranteed their indestructibility.

In the cases that we are interested in, eg, in fresh fracture of the hip where the prosthetic replacement of the femoral head was the treatment of choice, their use has mainly been in the elderly patient.[7] Because of its use, our thoughts on the prognosis and rehabilitation methods of the fractured hip in the aged has changed dramatically. The long period of suffering at bed rest with pain, complications and factors leading to both physical and mental decompensation, social and rehabilitative placement problems, as well as the non-union of the fracture site, has greatly diminished with better preservation of life. For this reason, 1950-1960 has frequently been referred to as the "decade of the hip prosthesis." [8]

Selection of Patients Under Our Study

Patients so treated at the Baltimore City Hospitals between 1963-1968 who met our criteria for the use of the previously described Evaluation Tests were used in this study.[7] The prostheses used in the majority of cases was the Moore Prosthesis. Included in our series are patients with fresh subcapital fractures. They must have ambulated just prior to the accident and operation, and be without terminal illnesses or other serious medical complications. Operative indications and the operative technic in each case follow well-described principles and guidelines.

Rehabilitation

These patients are in the older age group. Even in the absence of other complicating illnesses, the management of fractures in the elderly patient is decidedly different from the care of the younger patient.[9]

The injury itself may precipitate decompensation of the fragile physiological balance of an elderly patient. Metabolic, psychological, and dietary deficiencies may become manifest, and when they do, they may occur together to compound the problem. In all cases, however, the surgical trauma inflicted by the insertion of the Moore Prosthesis is a major one, despite the surgical skills of the operator. It is a major undertaking with an average loss of two units (1000 cc) of blood. The postoperative regimen requires more careful general medical and nursing care, blood and fluid replacement, as well as careful observation for confusion and bizarre behavior that may cause harm to the patient.

The initiation of the rehabilitation regimen can only be made when the recovery progress is satisfactory. An initial delay is almost always encountered before evaluation can begin. During this interval, measures to allow for preservation of the patient's physical activities, such as upper extremity and chest exercises, are needed and should be started as soon as possible, postoperatively.

Because of the nature of the prosthetic device, the physical therapy program may be modified from that of the program for patients suffering hip fracture treated by hip pinning. After sufficient confidence is gained by the patient and gradual readjustment made to the standing position, ambulation on the affected limb is possible without causing harm to the injured member. This is a great asset, especially in patients who are pain free and are willing to cooperate but tend to sometimes become confused in the strange surroundings or have trouble with balance. Aids, such as parallel bars and walkers, are most important at the early training phase.

Independence from the hospital and cumbersome aids is the ultimate goal and this depends on the individual. However, some form of a walking aid, eg, a cane should be used despite satisfactory progress.

Results

In our survey, 44 patients so treated met our criteria for study. The period of follow-up was from six months to two years with periodic re-evaluations. All except two patients were in the Group III age group, two were 61 years of age.

Initial mean MSCL score was between 26-30 (maximum possible score is 50) and initial mean ADL score was 30 (maximal possible score is 100). Again, one should take into account the postoperative status of the patient and the ADL score adjusts itself in the final evaluation, as the patients become ambulatory. The final ADL score was between 71 to 80 for this group.

Fifty-five percent of the patients were able to ambulate in some form. A large majority of these patients needed an aid such as a walker, crutch, or cane to help with balance; 28% required a wheelchair as their sole mode of getting about, and 14% attained the maximum activity possible by being able to sit up in a chair.

Summary

Patients with Austin Moore Prosthesis replacement of the femoral head for fresh subcapital fractures have a slightly easier time in the convalescent and rehabilitation period because they can bear some weight on the affected leg without causing damage or changing the prognosis. A comparison with the

results of the elderly patients treated with hip-pinning, previously reported,[10] is not attempted because of the large individual variation possible, but one can see that the initial MSCL and ADL scores do not show much difference, reflecting the dependence on age as to the ability of an individual's performance.

The time taken for an elderly patient with a prosthetic replacement of the hip to become steady when upright can be considerable and is certainly comparable to the time taken by a similar elderly patient with hip nailing. Thus, early weight-bearing in most cases of prosthetic replacement does not shorten training time in the more elderly and confused patient, but allows a slightly more liberal regimen with less emphasis on the problem of non-weight bearing on the affected leg. Because of this, in discharge planning, it may be possible to recommend less skilled family or custodial care, which sometimes means the difference between discharge from the hospital to the family and the need for chronic care facilities. Also, the need for a walking aid, the continuation of active care, and the dependence upon the treating institution, especially the Department of Physical Therapy is a common factor to all elderly patients with fracture of the hip, whether treated by hip pinning or prosthetic replacement of the femoral head.

Part IV: Treatment by Non-Surgical Methods

Nonoperative treatment for fracture of the hip continues to be an accepted method, despite the development of operative skills, methods, and materials, as well as the orthopaedist's training and enthusiasm for the operative treatment. Although not the ideal means for use in all types of hip fractures and in all persons, there are occasions when such treatment is indicated.[11, 12]

Many methods are available. Depending on the site and stability of the fracture, the methods may include immobilization by bed rest alone, bed rest with skin or skeletal traction, or in a plaster cast.

In all cases treated by this method, there is dependence on bed rest and bed care in the early period, followed by a training period to help the patient become as independent as possible using various supports and aids. During the period at rest, chest and upper extremity exercises are important. They keep the patient occupied, and good ventilation is assured. Strengthening of the upper extremity muscles is very important, especially for the later training period for transferring and using the various supports and aids.

Because of the slower nature of the regimen, more patience regarding the psychological needs must be realized. The inactivity of a previously healthy, normally functioning person may lead to many anxieties. Thus, an active occupational therapy program should be presented early.

As the patient's fracture heals and becomes stronger, a progressive training program in ambulation may then be structured with an evaluation of his abilities. With good cooperation, usually, at this stage, the regimen does not become much different than that of the rehabilitation of a person with fracture of the hip treated by operative methods.

Maryland State department of mental hygiene

Fact Sheet for 1969 Fiscal Year

In 1969, Maryland's hospitals for the mentally ill again treated a record number of patients, reflecting primarily the continuing rise in admissions of alcoholics. Ten years ago these facilities treated 15,853 patients; by 1969 this had increased 61.1% to 25,541. However, due to shortened periods of hospitalization of new admissions and the gradual, continuing decrease in the number of long term patients, the average daily size of the patient population declined 16.8% during this period from 8,952 to 7,451.

FISCAL YEAR	AVERAGE SIZE OF PATIENT POPULATION	TOTAL NUMBER TREATED DURING YEAR	ADMISSIONS	TOTAL SEPARATIONS
1959	8,952	15,853	4,164	4,367
1961	8,428	16,783	5,266	5,425
1963	8,218	18,726	7,257	7,173
1965	8,076	19,873	8,551	8,006
1967	8,006	22,899	11,091	11,298
1969	7,451	25,541	14,085	14,130
NET CHANGE	—1,501	+9,688	+9,921	+9,763
PERCENT CHANGE	—16.8	+61.1	+238.3	+223.6

A similar upward trend has been observed in virtually all private psychiatric hospitals, psychiatric units of general hospitals, clinics and other community centers reporting to the Maryland Psychiatric Case Register. For example, total admissions to the 102 clinics are estimated to have increased 10.5%, from 17,399 in 1968 to 19,220 in 1969. Since comparable data have been reported by other states, the question is frequently posed whether or not this reflects a rising incidence of mental illness. This cannot be readily answered since the numerical relationship between number of individuals treated in psychiatric facilities and total number of mentally disturbed or ill is not known. However, it is generally believed that the rate of occurrence of most mental illnesses has not changed appreciably and that these expanding figures, therefore, primarily reflect the growing acceptance and usage of psychiatric hospitals and clinics for the short-term, intensive treatment of alcoholism and acute psychoneurotic and personality disturbances. Recent legislation and court decisions have intensified these trends.

Rosewood, the larger of Maryland's two hospitals for the mentally retarded, last year operated at 21.0% in excess of capacity and, consequently, persisted in its policy of restricting admissions to available space and staff. Although the patient population has increased from 2,144 in 1959 to the current 3,090, Maryland's ratio of patients to total state population is 11.7% below the national average. In an effort to resolve this chronic problem, the Department is engaged in a three-pronged program involving (1) construction of new residential retardation facilities on a regional basis; (2) development with the Health Department of community-based services as alternatives to hospitalization; and (3) removing emotionally disturbed children from Rosewood, allowing conversion of two buildings for the care of the mentally retarded.

Skilled Hands

Skilled hands at Jobst Service Centers expertly measure your patient for a custom-made Jobst *Venous Pressure Gradient*® Support!

And *your* own prescription determines the precise counter-pressures to be built-in each garment! These selected counter-pressures can aid in moving pooled venous and lymph fluids, and offer a treatment of *choice* for varicose ulcers, varicose veins, stasis dermatitis, postmastectomy lymphedema, postphlebitic syndrome, post fracture, postoperative and injury edema.

Jobst Prescription *Venous Pressure Gradient* Supports include stockings, lymphedema sleeves and waist-high garments of many types. Jobst also makes special garments for unusual conditions.

ROBERT E. FARBER, MD, MPH, COMMISSIONER

Baltimore City health department

Evaluation Service for the Elderly

A new service for Baltimore's older residents was inaugurated July 1 under the joint sponsorship of the Baltimore City Health Department, the State Commission on the Aging, and the Maryland State Departments of Health and Mental Hygiene. Known as the Geriatric Evaluation Service, the program will seek to reduce admissions of Baltimore city residents aged 65 and over to state mental hospitals, and to maintain as many as possible in their own homes. At present, approximately 400 patients aged 65 and over are admitted each year to Crownsville, Springfield and Spring Grove State hospitals from Baltimore city. The highest number of these admissions comes from Baltimore's inner city.

Funded by a federal grant under Title III of the Older Americans Act and a Community Mental Health Services Demonstration Grant from the State Department of Mental Hygiene, the service is available to everyone regardless of income.

Now located in the Good Samaritan Hospital on Loch Raven Boulevard, the service, under City Health Department administration, is designed to provide a pre-admission evaluation to Baltimore city residents aged 65 and over for whom mental hospital admission is contemplated. The evaluation will be made within the patient's own environment to assess his medical, psychiatric and social needs. If he can best be treated at home or in the community, assistance will also be provided in locating and using relevant resources.

The program's director, Mrs. Mary Guth, received her B.S. degree at Towson State College and her master's degree in social work from the University of Pennsylvania. Specializing as a psychiatric social worker, she has served at Spring Grove State Hospital, in community mental health clinics of county health departments throughout the state and most recently in the Baltimore City Health Department.

The program is presently funded through January 31, 1970. It is anticipated, however, that funds will be made available on a continuing basis to meet the growing mental health needs of our older population. Further information may be obtained by calling 323-2200, extension 279.

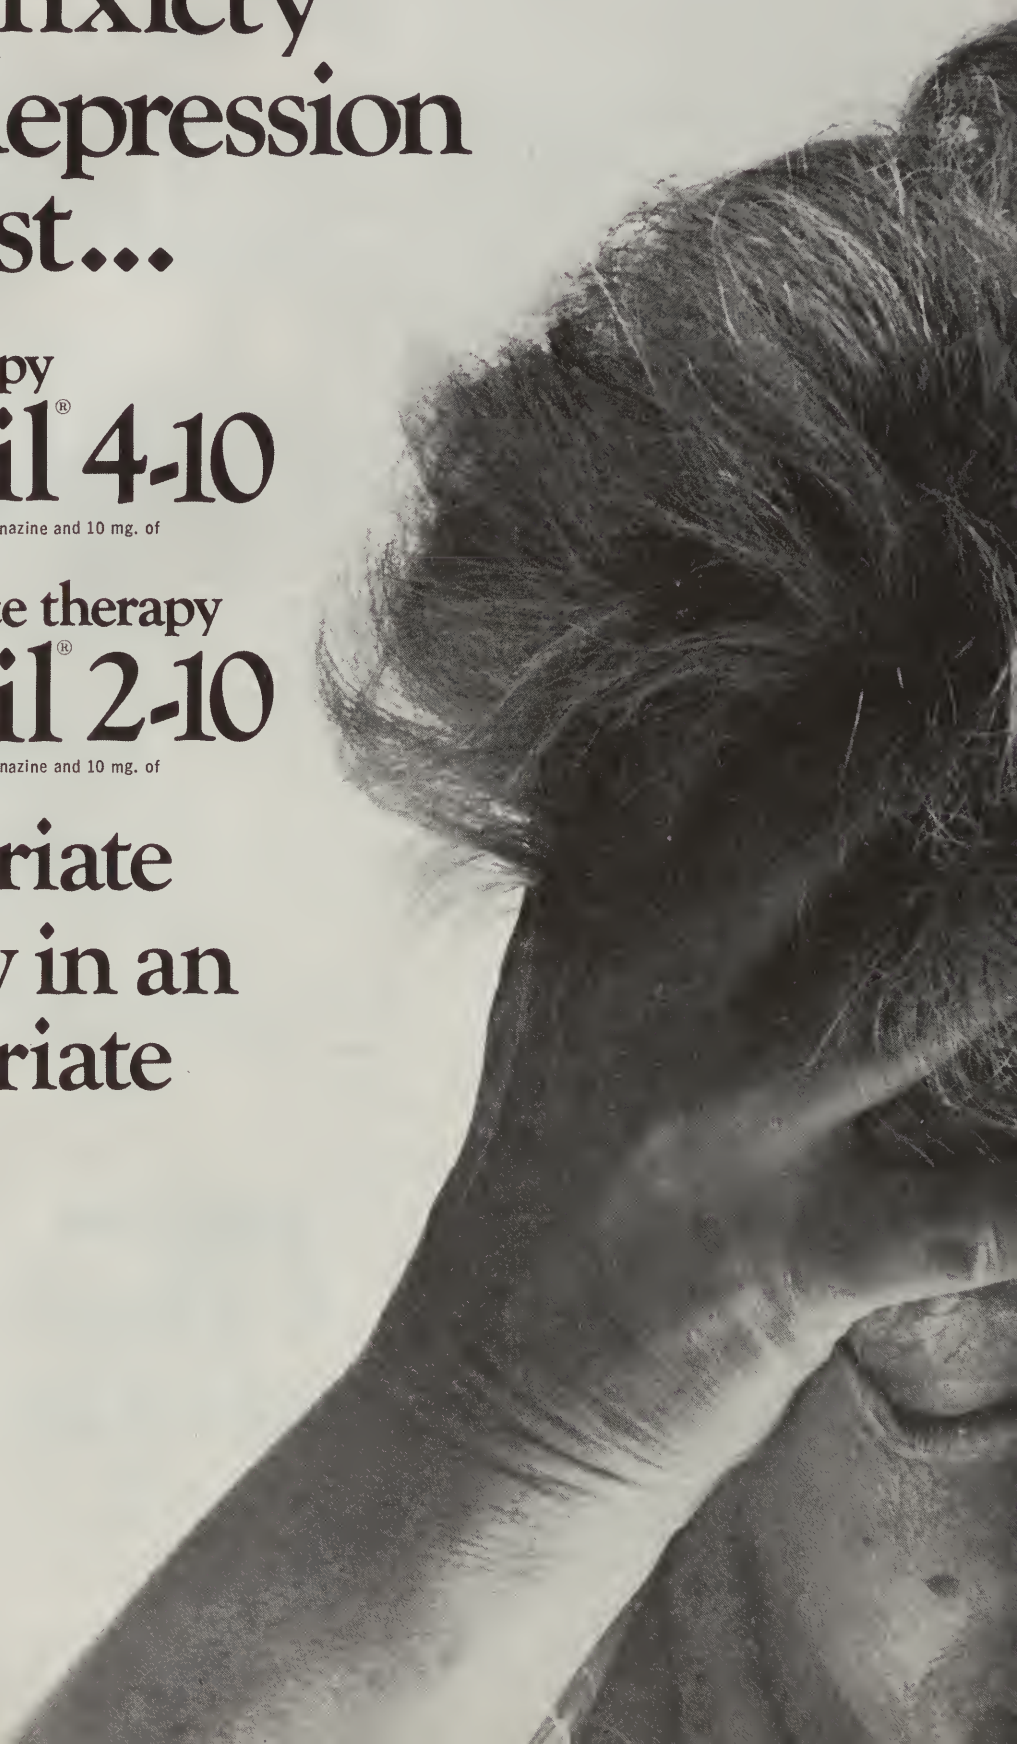
when it's late in life and anxiety and depression coexist...

initial therapy

Triavil® 4-10



Each tablet contains 4 mg. of perphenazine and 10 mg. of amitriptyline hydrochloride

maintenance therapy

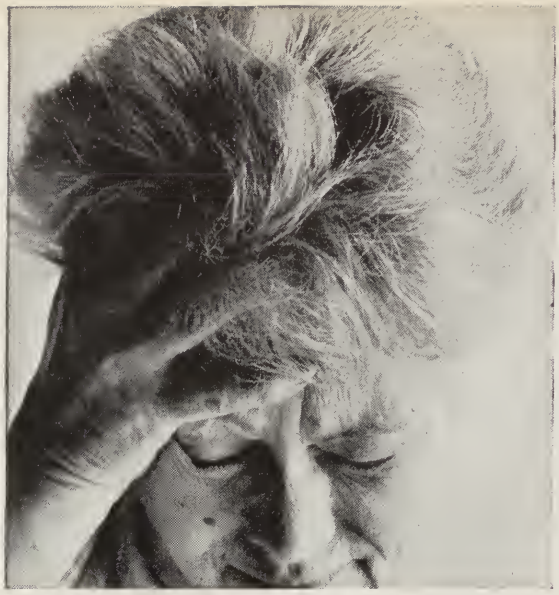
Triavil® 2-10

Each tablet contains 2 mg. of perphenazine and 10 mg. of amitriptyline hydrochloride.

appropriate therapy in an appropriate dosage

During the years of declining strength and increasing infirmity, many patients are more sensitive to both the desired response and the unwanted effects of some drugs. That's when low-dosage therapy is needed. And that's when TRIAVIL 4-10, as initial therapy, and TRIAVIL 2-10, for maintenance, can prove particularly useful.

Starting with TRIAVIL 4-10 should help minimize possible dose-related side effects in the geriatric patient with coexisting anxiety and depression. And, subsequently, TRIAVIL 2-10 can increase flexibility in adjusting maintenance dosage.



Activities made hazardous by diminished alertness should be avoided. You will want to inform your patients that the effects of alcohol may be potentiated. Because of the potentiation of other drug effects possible with MAO inhibitors, such agents should not be given concomitantly with TRIAVIL. However, therapy with TRIAVIL can be initiated cautiously two weeks or more after withdrawal of the MAOI drugs. And, until significant remission is observed, close supervision of any seriously depressed patient is, of course, essential to guard against possible suicide. The drug is contraindicated in glaucoma, in patients expected to experience problems of urinary retention, in drug-induced CNS depression, and in bone marrow depression.

TRIAVIL 4-10 & 2-10—tranquilizer-antidepressant therapy especially appropriate for the elderly patient so often intolerant to medication in high dosages.

TRIAVIL® **for moderate to severe anxiety with coexisting depression**

containing perphenazine and amitriptyline HCl
TRANQUILIZER-ANTIDEPRESSANT

For additional prescribing information, please see following page.

TRIAVIL®

TRANQUILIZER-ANTIDEPRESSANT

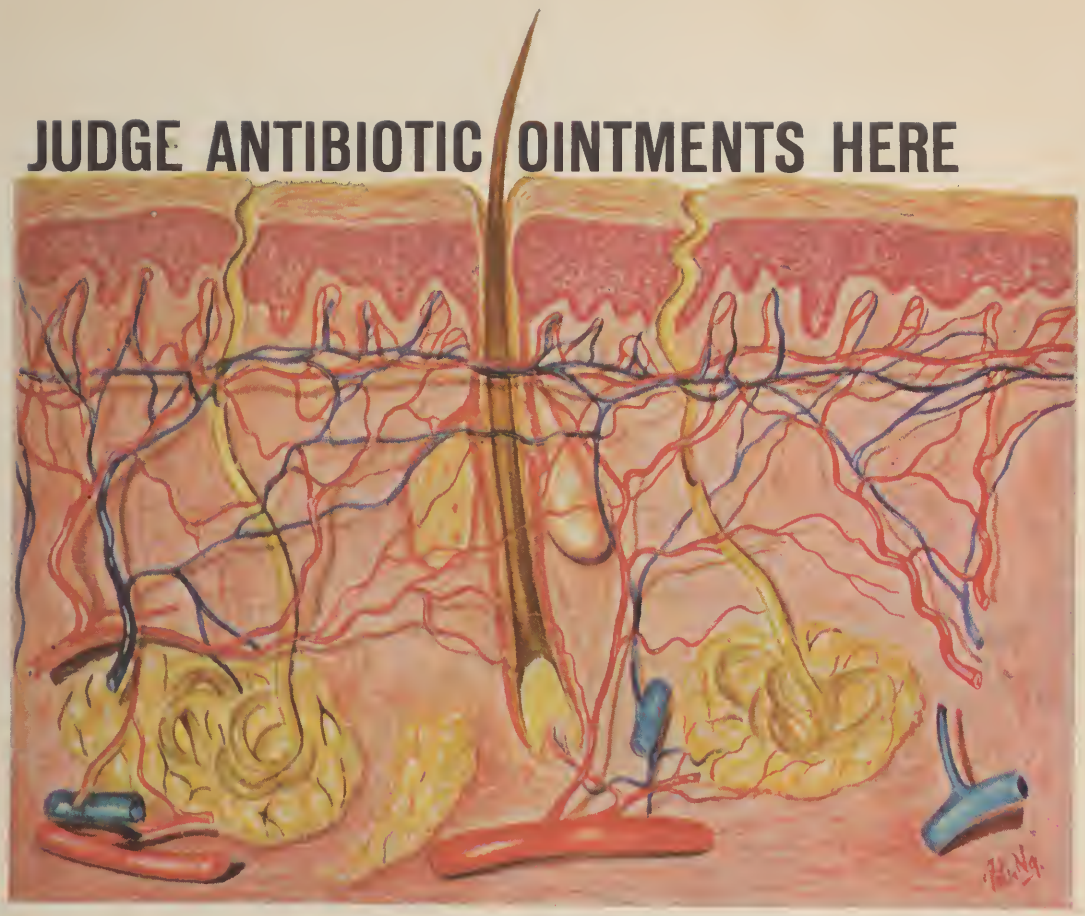
TRIAVIL 4-10: Each tablet contains 4 mg. of perphenazine and 10 mg. of amitriptyline hydrochloride.
TRIAVIL 2-25: Each tablet contains 2 mg. of perphenazine and 25 mg. of amitriptyline hydrochloride.
TRIAVIL 4-25: Each tablet contains 4 mg. of perphenazine and 25 mg. of amitriptyline hydrochloride.
TRIAVIL 2-10: For use in adjusting maintenance dosage. Each tablet contains 2 mg. of perphenazine and 10 mg. of amitriptyline hydrochloride.

for moderate to severe anxiety with coexisting depression

INDICATIONS: Patients with moderate to severe anxiety and/or agitation and depressed mood; patients with depression in whom anxiety and/or agitation are severe; patients with depression and anxiety in association with chronic physical disease; schizophrenics with associated depressive symptoms.

CONTRAINDICATIONS: Central nervous system depression from drugs (barbiturates, alcohol, narcotics, analgesics, antihistamines); bone marrow depression; urinary retention; pregnancy; glaucoma. Do not give in combination with MAOI drugs because of possible potentiation that may even cause death. Allow at least 2 weeks between therapies. In such patients therapy with TRIAVIL should be initiated cautiously, with gradual increase in the dosage required to obtain a satisfactory reponse.

WARNINGS: Patients should be warned against driving a car or operating machinery or apparatus requiring alert attention, and that response to alcohol may be potentiated.



PRECAUTIONS: Suicide is always a possibility in mental depression and may remain until significant remission occurs. Supervise patients closely in case they may require hospitalization or concomitant electroshock therapy. Untoward reactions have been reported after the combined use of antidepressant agents having various modes of activity. Accordingly, consider possibility of potentiation in combined use of antidepressants. Not recommended for use in children. Mania or hypomania may be precipitated in manic-depressives (perphenazine in TRIAVIL seems to reduce likelihood of this effect). If hypotension develops, epinephrine should not be employed, as its action is blocked and partially reversed by perphenazine. Caution patients about errors of judgment due to change in mood.

SIDE EFFECTS: Similar to those reported with either constituent alone. **Perphenazine:** Should not be used indiscriminately. Use caution in patients with history of convulsive disorders or severe reactions to other phenothiazines. Likelihood of untoward actions greater with high doses. Closely supervise with any dosage. Side effects may be any of those reported with phenothiazine drugs: blood dyscrasias (pancytopenia, thrombocytopenic purpura, leukopenia, agranulocytosis, eosinophilia); liver damage (jaundice, biliary stasis); extrapyramidal symptoms (opisthotonos, oculogyric crisis, hyperreflexia, dystonia, akathisia, dyskinesia, parkinsonism) usually controlled by the concomitant use of effective antiparkinsonian drugs and/or by reduction in dosage, but sometimes persist after discontinuation of the phenothiazine; severe, acute hypotension (of particular concern in patients with mitral insufficiency or pheochromocytoma); skin disorders (photosensitivity, itching, erythema, urticaria, eczema, up to exfoliative dermatitis); other allergic reactions (asthma, laryngeal edema, angioneurotic edema, anaphylactoid reactions); peripheral edema; reversed epinephrine effect; endocrine disturbances (lactation, galactorrhea, disturbances of menstrual cycle); grand mal convulsions; cerebral edema; altered cerebrospinal fluid proteins; polyphagia; paradoxical excitement; photophobia; skin pigmentation; failure of ejaculation; EKG abnormalities (quinidine-like effect); reactivation of psychotic processes; catatonic-like states; autonomic reactions such as dryness of the mouth, headache, nausea, vomiting, constipation, obstipation, urinary frequency, blurred vision, nasal congestion, and a change in the pulse rate; hypnotic effects; pigmentary retinopathy; corneal and lenticular pigmentation; occasional lassitude; muscle weakness; mild insomnia; significant unexplained rise in body temperature may suggest intolerance to perphenazine, in which case discontinue. Antiemetic effect may obscure signs of toxicity due to overdosage of other drugs or make diagnosis of other disorders such as brain tumors or intestinal obstruction difficult. May potentiate central nervous system depressants (opiates, analgesics, antihistamines, barbiturates, alcohol), atropine, heat, and phosphorous insecticides. **Amitriptyline:** Careful observation of all patients recommended. Side effects include drowsiness (may occur within the first few days of therapy); dizziness; nausea; excitement; hypotension; fainting; fine tremor; jitteriness; weakness; headache; heartburn; anorexia; increased perspiration; incoordination; allergic-type reactions manifested by skin rash, swelling of face and tongue, itching; numbness and tingling of limbs, including peripheral neuropathy; activation of latent schizophrenia (however, the perphenazine content may prevent this reaction in some cases); epileptiform seizures in chronic schizophrenics; temporary confusion, disturbed concentration, or transient visual hallucinations on high doses; evidence of anticholinergic activity, such as tachycardia, dryness of mouth, blurring of vision, urinary retention, constipation, paralytic ileus; agranulocytosis; jaundice. The antidepressant activity may be evident within 3 or 4 days or may take as long as 30 days to develop adequately, and lack of response sometimes occurs. Response to medication will vary according to severity as well as type of depression present. Elderly patients and adolescents can often be managed on lower dosage levels.

Before prescribing or administering, read product circular with package or available on request.

where today's theory is tomorrow's therapy

JUDGE ANTIBIOTIC OINTMENTS HERE

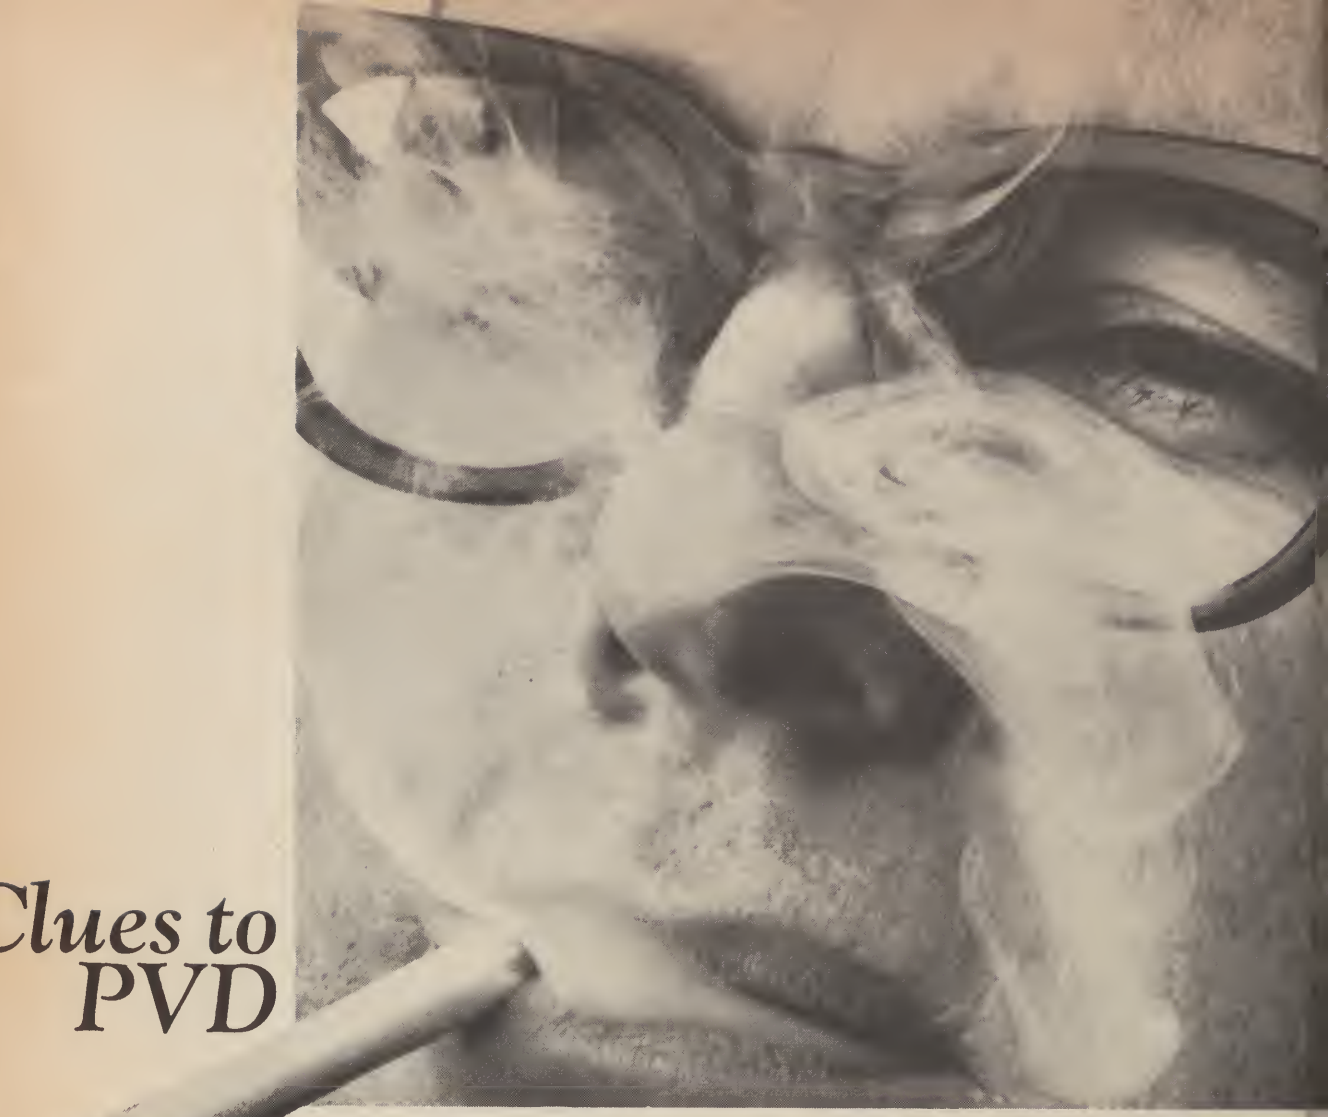
Results on skin are final proof of any topical antibiotic's effectiveness

No in vitro test can duplicate a clinical situation on living skin. 'Neosporin' (polymyxin B—bacitracin—neomycin) Ointment has consistently proven its effectiveness in thousands of cases of bacterial skin infection. The spectra of the three antibiotics overlap in such a way as to provide bactericidal action against most pathogenic bacteria likely to be found topically. Diffusion of the antibiotics from the special petrolatum base is rapid since they are insoluble in the petrolatum, but readily soluble in tissue fluids. The Ointment is bland and nonirritating.

Caution: As with other antibiotic preparations, prolonged use may result in overgrowth of nonsusceptible organisms and/or fungi. Appropriate measures should be taken if this occurs. Articles in the current medical literature indicate an increase in the prevalence of persons allergic to neomycin. The possibility of such a reaction should be borne in mind.

Contraindications: This product is contraindicated in those individuals who have shown hypersensitivity to any of its components.

Supplied: Tubes of 1 oz., ½ oz. with applicator tip, and ⅛ oz. with ophthalmic tip.



Complete literature available on request from Professional Services Dept. PML.

BURROUGHS WELLCOME & CO. (U.S.A.) INC., Tuckahoe, N.Y.

Clues to PVD

The heavy smoker with vasospasm

He may be comparatively young or approaching middle age. Typically, he is a heavy cigarette smoker—a pack or more a day for a number of years. Whether smoking is a causative or an important exacerbating factor in peripheral vascular disease is still under discussion. But the vasoconstrictive effects of nicotine are firmly supported by a substantial body of laboratory and clinical evidence, and the close association is now generally accepted.

Thus, a history of heavy smoking coupled with vasospasm may serve as warning signals to the physician. When a diagnosis is established, therapeutic measures are directed toward increasing the local circulation, and appropriate management of the patient's general medical needs should be instituted. These include the important safeguards of keeping warm and refraining from smoking.

Before prescribing Roniacol Timespan (nicotinyl alcohol tartrate), please consult complete product information, a summary of which follows.

Indications: Conditions associated with deficient circulation; *e.g.*, peripheral vascular disease, vascular spasm, varicose ulcers, decubital ulcers, chilblains, Meniere's syndrome and vertigo.

Caution: Roche Laboratories endorses caution in the administration of any therapeutic agent to pregnant patients.

Side Effects: Transient flushing, gastric disturbances, minor skin rashes and allergies may occur in some patients, seldom requiring discontinuation of the drug.

Dosage: 1 or 2 Timespan Tablets morning and night.

How Supplied: Timespan Tablets—150 mg nicotinyl alcohol in the form of the tartrate salt —bottles of 50.

Roche
LABORATORIES
Division of Hoffmann-La Roche Inc.
Nutley, New Jersey 07110

Important in total management of peripheral vascular disease, vascular spasm or chilblains

Roniacol® Timespan®

(nicotinyl alcohol tartrate)

for relief of ischemic symptoms

Convenience of b.i.d. dosage—sustained-release Timespan Tablets usually provide prolonged relief of ischemic symptoms with two doses daily.

Smoothness of onset—the action of Roniacol (nicotinyl alcohol) is smooth and gradual in onset, rarely causing severe flushing.

Selectivity of action—relaxes the musculature of peripheral blood vessels.

High degree of safety—side effects seldom require discontinuation of therapy.

Preludin®
phenmetrazine hydrochloride

Preludin is indicated only as an anorexigenic agent in the treatment of obesity. It may be used in simple obesity and in obesity complicated by diabetes, moderate hypertension (see Precautions), or pregnancy (see Warning).
Contraindications: Severe coronary artery disease, hyperthyroidism, severe hypertension, nervous instability, and agitated prepsychotic states. Do not use with other CNS stimulants, including MAO inhibitors.
Warning: Do not use during the first trimester of pregnancy unless potential benefits outweigh possible risks. There have been clinical reports of congenital malformation, but causal relationship has not been proved. Animal teratogenic studies have been inconclusive.
Precautions: Use with caution in moderate hypertension and cardiac decompensation. Cases involving abuse of or dependence on phenmetrazine hydrochloride have been reported. In general, these cases were characterized by excessive consumption of the drug for its central stimulant effect, and have resulted in a psychotic illness manifested by restlessness, mood or behavior changes, hallucinations or delusions. Do not exceed recommended dosage.
Adverse Reactions: Dryness or unpleasant taste in the mouth, urticaria, overstimulation, insomnia, urinary frequency or nocturia, dizziness, nausea, or headache.
Dosage: One 25 mg. tablet b.i.d. or t.i.d. Or one 75 mg. Endurets tablet a day, taken by midmorning.
Availability: Pink, square, scored tablets of 25 mg. for b.i.d. or t.i.d. administration, in bottles of 100 and 1000.
Pink, round Endurets® prolonged-action tablets of 75 mg. for once-a-day administration, in bottles of 100 and 1000. (B)R3-46-560-B

They run a good chance of losing weight.

Exercise and Preludin run together in helping patients to lose weight.

Preludin often puts a curb on appetite and promotes a sense of well-being. By boosting a dieter's spirit, Preludin may help patients get the exercise you may prescribe.

One Endurets tablet taken between breakfast and midmorning usually provides daylong and early-evening suppression of appetite.

A few patients may experience overstimulation or insomnia. For a brief summary of all adverse reactions, precautions, warning and contraindications, please see the adjoining page.

MRS. FRANK A. FARAINO, EDITOR

Vivacious New President:

Mrs. Wallace H. Sadowsky

Mrs. Wallace H. Sadowsky of Havre de Grace, Maryland, was installed as President of the Woman's Auxiliary to the Medical and Chirurgical Faculty of the State of Maryland at the 20th Annual Convention on April 10, 1969. Mrs. Sadowsky has been active in medical auxiliary work since 1960, when she was one of the founding members of the Woman's Auxiliary to the Harford County Medical Society; she later served as president of that organization. She has served on the Board of the State Auxiliary since 1961, when she was its secretary. Since then, she has been a vice president for four years and has been elected president-elect twice, having had to resign late in her first term as president-elect due to illness. She has also served the State Auxiliary as Publicity Chairman, AMA Education and Research Foundation Chairman for two years, Representative to Med-Chi's Public Relations Committee for two years, and as Membership Chairman.

Mrs. Sadowsky (Bea) is very proud of her Maryland heritage, having been born in Scotland, St. Mary's County, where Maryland was founded, educated in the Maryland public schools, and having attended the University of Maryland. In high school she was Valedictorian of her graduating class and received the Good Citizenship Award of the DAR. At the University of Maryland she was a member of the Phi Sigma Sigma Sorority and the Alpha Lambda Delta Honorary Fraternity.

Bea feels very close to the profession of medicine; not only is she married to a physician-surgeon, but she has two brothers who are physicians, Drs. Louis and Joseph Shuman.

Dr. and Mrs. Sadowsky have four daughters: Natalie, a recent graduate of Boston University and now a medical social worker at Beth Israel Hospital in Boston; Jocelyn, a sophomore at Mary Washington College of the University of Virginia; Shelley, a high school senior; and Iris, a high school freshman. All of their daughters are honor students, and have studied piano at the Peabody.

Mrs. Sadowsky

In addition to medical auxiliary work, Bea serves on the Harford County Board of Directors of the

American Cancer Society. She has been active in Girl Scouts, Homemakers Club, PTA, Harford Memorial Hospital Auxiliary, Hadassah, Harford Jewish Center Board of Directors, and Ladies Auxiliary.

Bea urges that all physicians' wives become active members of the Medical Auxiliary. In her inaugural address she said, "There are enough facets in our work that every physician's wife can easily find one area in which she can be effective. If we can help one alcoholic, discourage one youth from trying narcotics, provide one student with a nurse's education, make one loan to a needy medical student, provide one piece of needed equipment for an overseas physician or hospital, make one person aware of medical quackery, detect one diabetic, immunize one child from measles, and prevent the passing of one piece of poor medical legislation, then we will have served effectively and truly lived up to our motto of 'HYGEIA FILIAE'—Handmaidens to Health." She said that small auxiliaries need not be apologetic for their few members, but should be proud to have an organization. "Getting together and promoting fellowship is one of the important facets of an Auxiliary program. Some day a need may arise and this small group can be ready to fill it." Bea feels it is a privilege to serve. She asserted that ". . . we must make communities everywhere aware that physicians and physicians' wives play a comprehensive role in health planning and care . . . . Auxiliaries can help build appreciation, understanding and goodwill for the medical profession, for indeed they are 'built-in' public relations ambassadors."

Serving with Mrs. Sadowsky on the Board of the Woman's Auxiliary are the following:

Mrs. Raymond M. Yow, President-elect and Membership Chairman

Mrs. Elmer G. Linhardt, 1st Vice President and AMA-ERF Chairman

Mrs. DeWitt E. DeLawter, 2nd Vice President and Legislation Chairman

Mrs. R. Kennedy Skipton, 3rd Vice President and Convention Chairman

Mrs. Robert J. Dawson, 4th Vice President and Health Careers Chairman

Mrs. Edgar E. Folk, III, Recording Secretary

Mrs. Sullins G. Sullivan, Treasurer

Mrs. Richard D. Bauer, Corresponding Secretary

Lipoprotein Phenotypes

LAWRENCE F. MISANIK, MD
Director of Laboratory
St. Joseph Hospital, Towson, Maryland

In recent years, there has been considerable interest in patients with hyperlipidemias, and the work of Fredrickson, Levy, and Lees [1] who introduced a method of classification of these disorders, has done much to increase this interest. Although their approach was developed, primarily, to study the genetically-determined disorders of lipid metabolism, it has also been useful in dealing with the problems of acquired hyperlipidemias. In fact, some of the therapeutic modalities available for treatment of the primary groups can be useful in the management of the acquired hyperlipidemias.

Although large-scale studies with long-term follow-up remains to be done before the efficaciousness of the therapy can be evaluated, it would seem that the frequency of occurrence of atheromatous cardiovascular disease would indicate that patients having certain types of hyperlipidemias should have their abnormal biochemical parameters corrected by judicious selection and use of dietary restriction and medication.

To apply these corrective modalities would require the recognition of patients with these disorders and classification of their abnormality.

Clinical Manifestations. Frequent features seen in hyperlipidemias include the presence of xanthomas of various types occurring in various locations: eruptive xanthomas, xanthelasma, tuberous xanthomas, and tendinous xanthomas. Deposits of lipids in the creases of the palms may be evident, giving rise to yellow striae. Arcus senilis can be found. In addition, some of these patients may be subject to accelerated occlusive arteriosclerotic cardiovascular disease. Patients may have abdominal pain which can be associated with an elevation of serum amylase or lipase. If these patients are subjected to an exploratory laparotomy, a milky fluid may be found intraperitoneally. Obesity may be present.

Other findings which may warrant cause for concern are the presence of a lactescent serum, abnormal glucose tolerance test, diabetes mellitus, hyperuricemia, and an elevation in serum cholesterol.

Patients having secondary hyperlipidemias will have the clinical findings of their primary disease state. Secondary hyperlipidemia occurs in hypothyroidism, nephrosis, hepatic disease, dysproteinemias (myeloma, cryoglubulinemia, and macroglobulinemia), pancreatitis and alcoholism, idiopathic hypercalcemia, patients on progestational drugs, and diabetes mellitus.

Differential Diagnosis. Faced with a patient possibly having a hyperlipidemia, one must attempt to classify the disease process so that proper therapy can be instituted. In the classification of Fredrickson et al the abnormalities of lipid metabolism have been translated to abnormalities of lipoproteins, as detectable by lipoprotein electrophoresis in conjunction with triglyceride and cholesterol determinations.

To correctly interpret the data obtained from these studies, certain precautions must be followed before these studies can be undertaken. The patient must be on a normal diet for at least 7-14 days before his serum lipid pattern can be studied. After the patient has fasted for 12-14 hours, the specimen must be collected in a vacutainer containing EDTA as the

anticoagulant. The specimen should be taken to the laboratory immediately, or if this is not possible, the plasma must be separated and the specimen refrigerated. Do not freeze the sample. The test sample should be delivered to the laboratory as soon as possible.

The tests requested should include cholesterol, triglycerides, and lipoprotein electrophoresis. The latter need not be done if the serum cholesterol and triglycerides are clearly within normal limits, for this adequately rules out hyperlipidemias. However, it may be necessary for proper classification to repeat these analyses or to perform these determinations on the patient's family.

The keystone to classification is lipoprotein electrophoresis. In case of lipoprotein electrophoresis, the paper is stained with a fat-soluble dye that stains the molecules of protein that contain fat. This allows a pattern to emerge. There are usually three bands visible in a lipoprotein electrophoretogram. They are called beta lipoprotein, pre-beta lipoprotein, and alpha lipoprotein. In certain abnormal patterns, a fourth band can be found which is due to the presence of chylomicrons.

Types of Hyperlipoproteinemia: Type I—Exogenous Hyperlipidemia

This is an exogenous hyperlipidemia that is usually familial, rare, and characterized by elevations of cholesterol, triglycerides, and chylomicrons. The plasma from patients exhibiting these characteristics is creamy in appearance. Clinically, these patients have hepatosplenomegaly, eruptive xanthomas, lipemia retinalis, and periodic episodes of abdominal pain that may or may not be associated with increases in serum amylase and lipase. Investigations indicate that these patients have a deficiency in a lipoprotein lipase, which leads to a decrease in the clearing of exogenous triglycerides and cholesterol, leading to an excess in circulating chylomicrons.

Infrequently, one finds this type of hyperlipoproteinemia occurring as an acquired defect in patients with hypothyroidism, alcoholism and pancreatitis, and lupus erythematous.

Evidently, the presence of these chylomicrons does not produce accelerated atherosclerosis. Treatment consists of a moderate reduction of fat in the diet.

Type II—Hyper-beta Lipoproteinemia

This type is a very common disturbance of lipid metabolism and is characterized by an elevation of beta lipoprotein and cholesterol, with a lesser increase in triglycerides. It can occur both as a primary or an acquired form. Xanthomas are frequently found and can be tendinous and tuberous, occurring over the extensor surfaces of the extremities. Arcus senilis is common; accelerated coronary artery disease is frequently seen. The diagnosis of the primary type is dependent upon the demonstration of the lipoprotein abnormalities in both parents; or in one of the parents with the occurrence of xanthomata in the investigated patient by the age of ten years.

The acquired Type II hyperbeta lipoproteinemia can be found usually in obstructive hepatic disease, myxedema, nephrosis, and rarely in other diseases, such as, dysproteinemias and idiopathic hypercalcemia. It may also arise from excess in dietary cholesterol and saturated fats.

Treatment for the acquired form of the disease should be directed towards the primary disorder. The familial type can be managed by dietary means (low cholesterol with supplemented polyunsaturated fats) and medication. Medications include cholestyramine, beta-sitosterol, estogens, and clofibrate *(Atromid-S)*.

Type III—Broad Beta Band Disease

This type appears to occur only in the primary form. The plasma may be clear, cloudy, or milky. This type is characterized by a broad beta lipoprotein band by electrophoresis with elevations of serum cholesterol and serum triglycerides. Clinically, it is associated with xanthomata and characteristically, lipids can be deposited in the palmar creases. Associated findings can be mild diabetes mellitus and accelerated arteriosclerotic disease.

This type of hyperlipoproteinemia is very sensitive and responsive to variations in daily cholesterol and saturated fat intake, and can be controlled by dietary means. Clofibrate can also be useful.

Type IV—Endogenous Hyperlipidemia

These patients have a normal or elevated cholesterol; elevated triglycerides; clear, cloudy, or milky serum; and an elevation in the pre-beta fraction of the lipoprotein electrophoretogram. These patients tend to be obese and have eruptive xanthomata, lipemia retinalis, and bouts of abdominal pain. Hyperuricemia can occur. Frequently they have an abnormal glucose tolerance test. Accelerated arteriosclerosis is seen in this group of patients.

The secondary or acquired Type IV endogenous hyperlipidemia is found in patients with diabetes mellitus. In fact, patients with diabetes mellitus and acquired Type IV endogenous hyperlipemia may be difficult to separate from the primary form.

The secondary form can also be seen in pancreatitis with alcoholism, hypothyroidism, dysproteinemia, progestational drug therapy, gout, and other rare disease states. Treatment consists of weight control, decrease in carbohydrate intake, and the use of hypolipemic agents, such as, clofibrate, nicotinic acid, and heparin.

Type V—Mixed Hyperlipidemias

These patients have an elevation of cholesterol, triglycerides, and an increase in chylomicrons and pre-beta lipoproteins. The plasma appears creamy.

These patients may have eruptive xanthomas, lipemia retinalis, and abdominal pain. The patients are frequently obese and there is a history of familial diabetes mellitus and obesity. Hyperuricemia may be seen. Evidence of accelerated atherosclerosis has been striking.

Secondary forms occur in patients with diabetes mellitus, chronic pancreatitis, and recent alcoholic intake.

Management includes weight reduction by using a diet low in carbohydrates and fat, and clofibrate.

Dear Doctor, You made me what I am today— a whole lot slimmer!

TEPANIL—the right start in support of te weight-control program *you* recommend It reduces the appetite. Doesn't kill it. Weight loss is significant—gradual—yet there is a relatively low incidence of CNS stimulation. Because TEPANIL works on the appetite, not on the "nerves."

Contraindications: Concurrently with MAO inhibitors, in patients hypersensitive to this drug; in emotionally unstable patnts susceptible to drug abuse.

Warning: Although generally safer than the amphetamines, use with great caution in patients with severe hypertension or severe cardiovascular disease. Do not use during first trimester of pregnancy unless potential benefits outweigh potential risks.

Adverse Reactions: Rarely severe enough to require discontinuation of therapy, unpleasant symptoms with diethylpropion hydrochloride have been reported to occur in relatively low incidence.

As is characteristic of sympathomimetic agents, it may occasionally cause *CNS effects* such as insomnia, nervousness, dizziness, anxiety, and jitteriness. In contrast, CNS depression has been reported. In a few epileptics an increase in convulsive episodes has been reported.

Sympathomimetic *cardiovascular effects* reported include ones such as tachycardia, precordial pain, arrhythmia, palpitation, and increased blood pressure. One published report described T-wave changes in the ECG of a healthy young male after ingestion of diethylpropion hydrochloride; this was an isolated experience, which has not been reported by others.

Allergic phenomena reported include such conditions as rash, urticaria, ecchymosis, and erythema.

Gastrointestinal effects such as diarrhea, constipation, nausea, vomiting, and abdominal discomfort have been reported.

Specific reports on the hematopoietic system include two each of bone marrow depression, agranulocytosis, and leukopenia.

A variety of miscellaneous adverse reactions have been reported by physicians. These include complaints such as dry mouth, headache, dyspnea, menstrual upset, hair loss, muscle pain, decreased libido, dysuria, and polyuria.

Convenience of two dosage forms: TEPANIL Ten-tab tablets: One 75 mg. tablet daily, swallowed whole, in midmorning (10 a.m.); TEPANIL: One 25 mg. tablet three times daily, one hour before meals. If desired, an additional tablet may be given in midevening to overcome night hunger. Use in children under 12 years of age is not recommended.

Tepanil® Ten-tab®

(continuous release form)

(diethylpropion hydrochloride)

THE NATIONAL DRUG COMPANY
DIVISION OF RICHARDSON-MERRELL INC.
PHILADELPHIA, PENNSYLVANIA 19144 T-918A U.S. PATENT NO. 3,001,910 5/

heavenly relief
for unearthly cough

Benylin®
EXPECTORANT

Each fluidounce contains: 80 mg. Benadryl® (diphenhydramine hydrochloride, Parke-Davis); 12 grains ammonium chloride; 5 grains sodium citrate; 2 grains chloroform; 1/10 grain menthol; and 5% alcohol.

An antitussive and expectorant for control of coughs due to colds or of allergic origin, BENYLIN EXPECTORANT is the leading cough preparation of its kind. BENYLIN EXPECTORANT tends to inhibit cough reflex... soothes irritated throat membranes. And its not-too-sweet, pleasant raspberry flavor makes BENYLIN EXPECTORANT easy to take.

PRECAUTIONS: Persons who have become drowsy on this or other antihistamine-containing drugs, or whose tolerance is not known, should not drive vehicles or engage in other activities requiring keen response while using this preparation. Hypnotics, sedatives, or tranquilizers if used with BENYLIN EXPECTORANT should be prescribed with caution because of possible additive effect. Diphenhydramine has an atropine-like action which should be considered when prescribing BENYLIN EXPECTORANT.

ADVERSE REACTIONS: Side reactions may affect the nervous, gastrointestinal, and cardiovascular systems. Drowsiness, dizziness, dryness of the mouth, nausea, nervousness, palpitation, and blurring of vision have been reported. Allergic reactions may occur.

PACKAGING: Bottles of 4 oz., 16 oz., and 1 gal.

Parke, Davis & Company
Detroit, Michigan 48232

PARKE-DAVIS

symptoms of mixed anxiety-depression are rarely clear-cut

but they are often a clear indication for

Mellaril®
(thioridazine)
25 mg. t.i.d.

effective in mixed anxiety-depression and in moderate to severe anxiety

Before prescribing or administering, see Sandoz literature for full product information, including adverse reactions reported with phenothiazines. The following is a brief precautionary statement.

Contraindications: Severe central nervous system depression, comatose states from any cause, hypertensive or hypotensive heart disease of extreme degree.

Warnings: Administer cautiously to patients who have previously exhibited a hypersensitivity reaction (e.g., blood dyscrasias, jaundice) to phenothiazines. Phenothiazines are capable of potentiating central nervous system depressants (e.g., anesthetics, opiates, alcohol, etc.) as well as atropine and phosphorus insecticides. During pregnancy, administer only when necessary.

Precautions: There have been infrequent reports of leukopenia and/or agranulocytosis and convulsive seizures. In epileptic patients, anticonvulsant medication should also be maintained. Pigmentary retinopathy may be avoided by remaining within the recommended limits of dosage. Administer cautiously to patients participating in activities requiring complete mental alertness (e.g., driving). Orthostatic hypotension is more common in females than in males. Do not use epinephrine in treating drug-induced hypotension. Daily doses in excess of 300 mg. should be used only in severe neuropsychiatric conditions.

Adverse Reactions: *Central Nervous System*—Drowsiness, especially with large doses, early in treatment; infrequently, pseudoparkinsonism and other extrapyramidal symptoms; nocturnal confusion, hyperactivity, lethargy, psychotic reactions, restlessness, and headache. *Autonomic Nervous System*—Dryness of mouth, blurred vision, constipation, nausea, vomiting, diarrhea, nasal stuffiness, and pallor. *Endocrine System*—Galactorrhea, breast engorgement, amenorrhea, inhibition of ejaculation, and peripheral edema. *Skin*—Dermatitis and skin eruptions of the urticarial type, photosensitivity. *Cardiovascular System*—Changes in the terminal portion of the electrocardiogram have been observed in some patients receiving the phenothiazine tranquilizers, including Mellaril (thioridazine). While there is no evidence at present that these changes are in any way precursors of any significant disturbance of cardiac rhythm, several sudden and unexpected deaths apparently due to cardiac arrest have occurred in patients previously showing electrocardiographic changes. The use of periodic electrocardiograms has been proposed but would appear to be of questionable value as a predictive device. *Other*—A single case described as parotid swelling.

SANDOZ PHARMACEUTICALS, HANOVER, N.J. SANDOZ 69-384

WILLIAM J. PEEPLES, MD, MPH, COMMISSIONER

Maryland State department of health

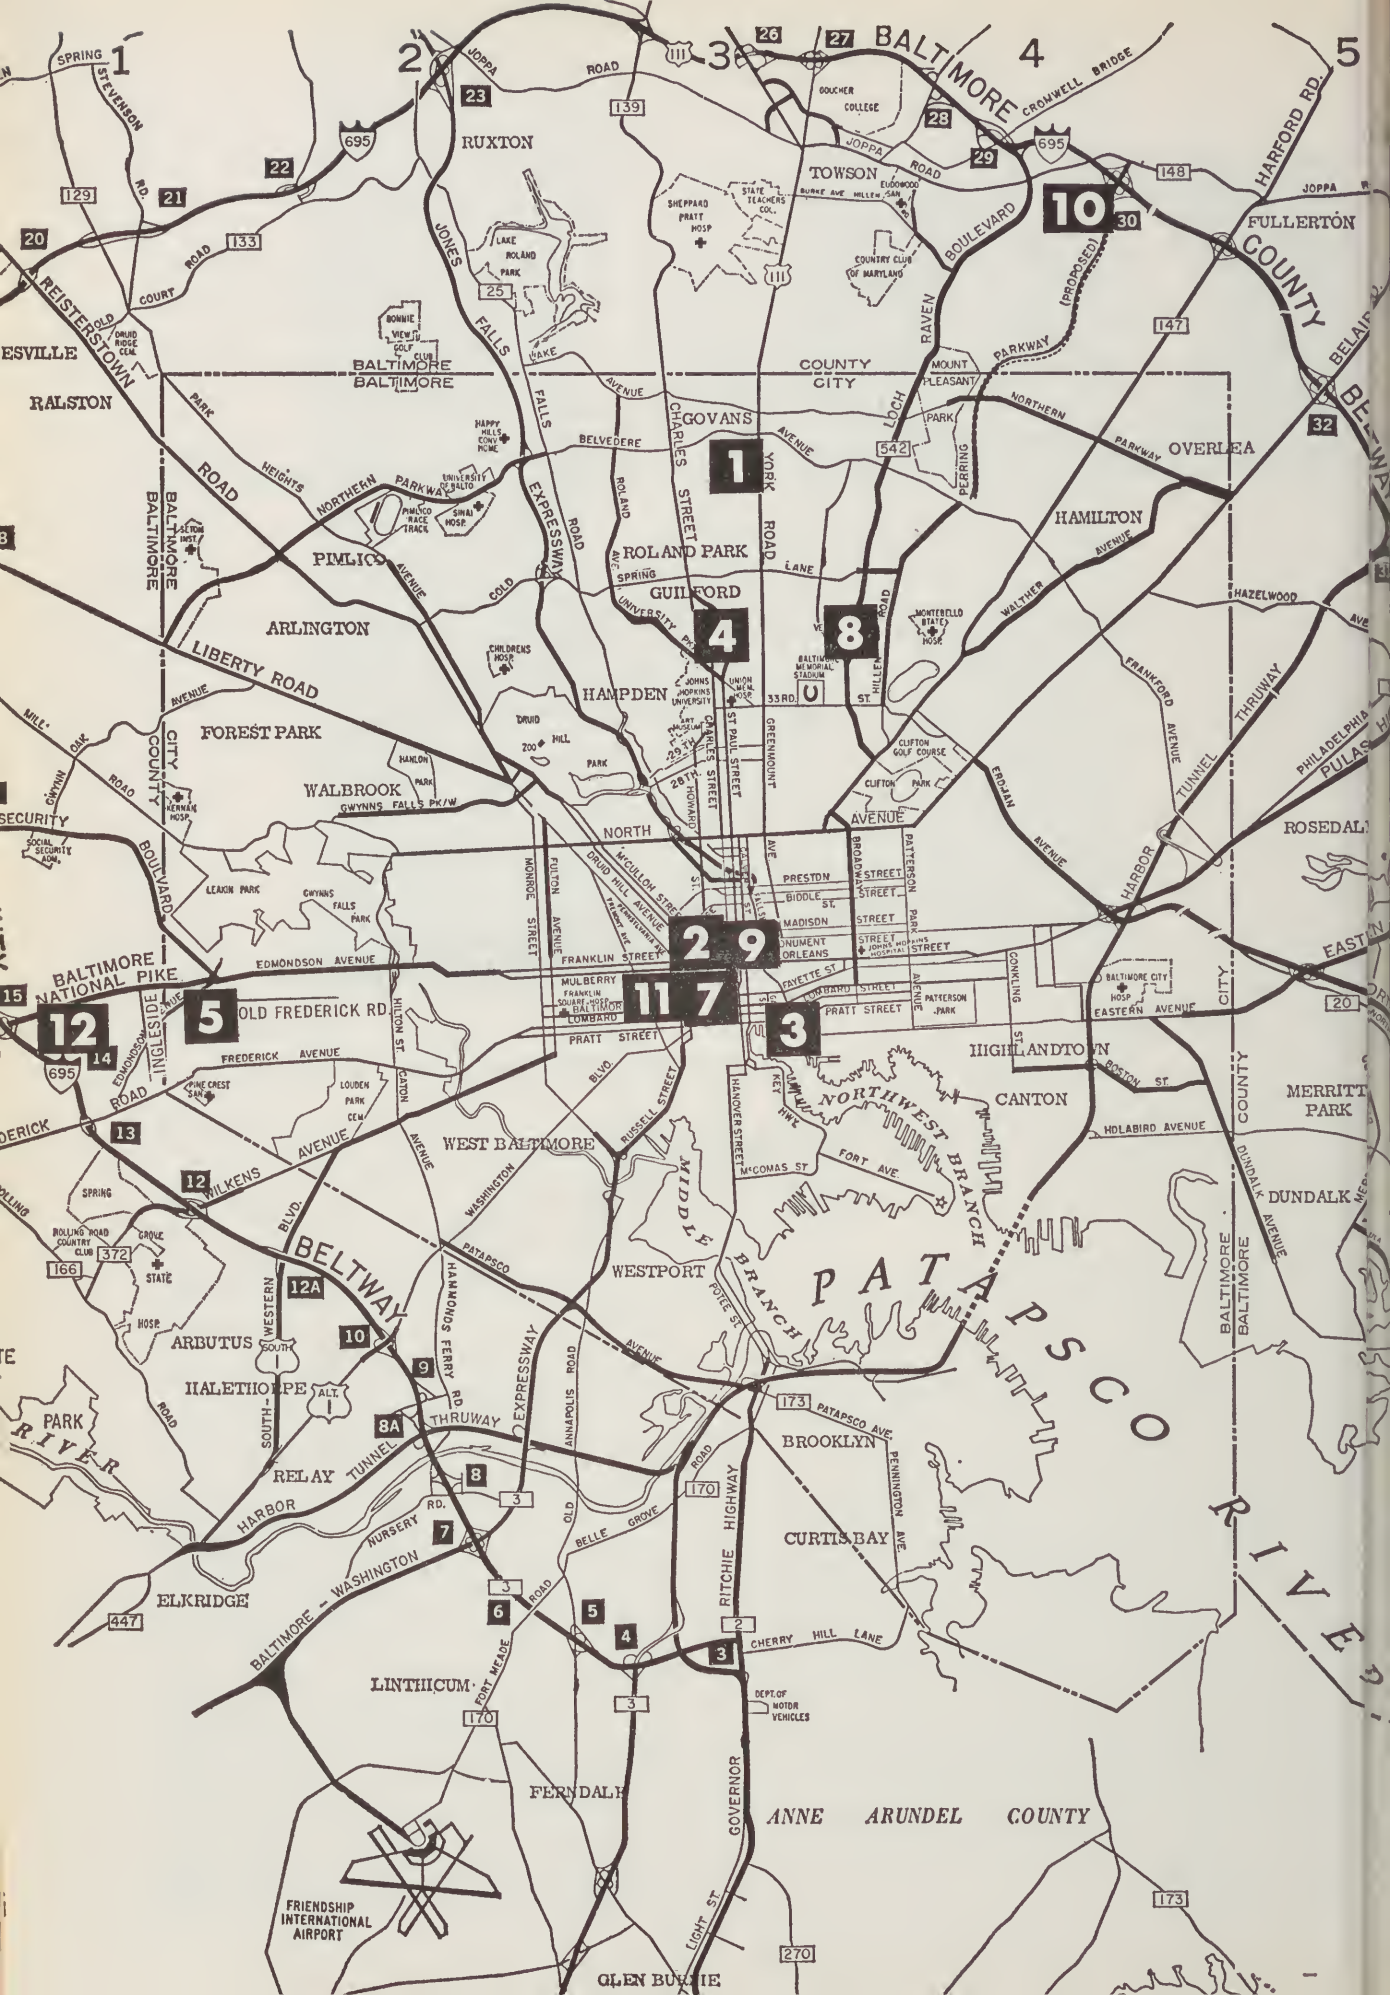
Federal Grant Approved for Family Planning Program

The Division of Maternal and Child Health received notification that a $165,287 federal grant has been approved to expand family planning services in Prince George's, Charles, and Calvert Counties.

The federal grant, awarded by the Children's Bureau of the US Department of Health, Education, and Welfare, will enable the local health departments in these three counties to increase the number of clinic sessions and to strengthen their educational programs for family planning.

The grant is helping to finance Phase I of a three-phase program which, by 1974, should provide family planning services for more than 80% of the women in these counties who request such services. Hopefully, as additional federal funds become available, the expanded program will be offered throughout the state.

Records show a slow, but steady, increase in the number of subdivisions in Maryland which provide family planning services. From four subdivisions conducting such clinics in 1962, the number increased to seven by 1963, and fourteen by 1964. At present, family planning clinic services are provided in the local health departments in all of the 24 subdivisions.



For the fiscal year 1967, there was a total of 691 combined Maternity and Family Planning Clinic sessions and 367 Family Planning Clinic sessions held in the 23 counties. Exclusive of Baltimore, 6,448 patients were seen in fiscal year 1967. This included 1,847 patients seen in clinics conducted in Montgomery County by Planned Parenthood, Inc., Washington, D.C. In Baltimore city, clinics are conducted in the outpatient departments of seven of the hospitals and in health department locations, and at locations of Planned Parenthood of Maryland, Inc.

In 1968, Family Planning clinics in all districts of Baltimore city served over 6,200 patients. Additional physician and nursing staff has been obtained to care for the rapidly increasing caseload of the Family Planning Clinics. The Model Cities Program is expected to be of great assistance in determining areas of need for new sites for Family Planning Clinics which should move out of primarily medical settings and still maintain high quality medical care.

The ultimate objective of the Family Planning Program is that all families in Maryland may have free choice in determining the spacing of their children and the size of their families.

In working toward this objective, the program respects the principle that freedom of choice implies that there are alternatives between which families may choose, and that families must be able to know something about these alternatives, including their possible consequences.

The program recognizes that in the area of family planning this element of choice relates to the health of the mother and child or children and to the quality of life parents wish to have for themselves and their children.

AN ANNOUNCEMENT TO MARYLAND PHYSICIANS WHOSE PATIENTS HAVE CHRONIC SLEEP DISTURBANCE

Recent advances in sleep research have made it possible to measure a variety of sleep disorders in otherwise normal patients.

To further these studies a clinic is being established at the Maryland State Psychiatric Research Center under the direction of Dr. Clinton Brown, Chief of Basic Sciences Research.

The primary purpose of this clinic will be to investigate the variables producing insomnia so that more effective treatment approaches may be formulated.

Of interest are: 1) the personality configuration, 2) sleeping habits and 3) psychophysiologic reactivity of the patient with chronic complaints of inability to fall asleep, frequent or early awakenings, somnambulism, enuresis or nightmares.

Individuals accepted for study will be given a physical exam, interview, psychometric test and polygraph recordings obtained during sleep.

Patients will be accepted by referral only and a diagnostic report will be furnished to the referring physician at the conclusion of the study.

Partial support for this project is being furnished by Friends of Psychiatric Research, a non-profit research foundation. While fees will not be charged, voluntary contributions by patients to offset study costs will be welcomed.

Additional information or appointment may be obtained by calling Mrs. Zaborowski at 744-8700, Ext. 252, 10 A.M. to 4 P.M. Monday thru Friday.

Albert A. Kurland, M.D., Superintendent.

One of these disposables comes prefilled.
Its unit dose – in nonreactive glass
cartridge – is premeasured.
The cartridge is clearly labeled:
drug name, strength, control number.
Even expiration date where appropriate.

You're more confident that the patient gets...

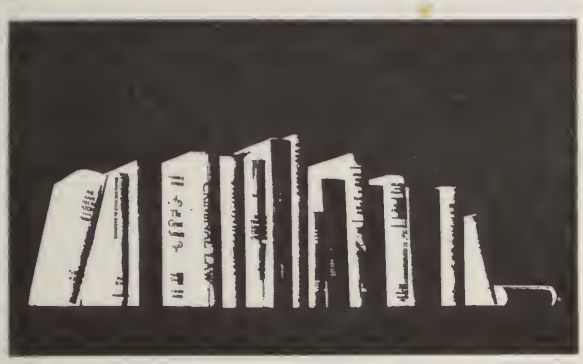
. . . just what the doctor ordered with the Tubex Closed Injection System.

Injections with the Tubex system are as easy as 1, 2, 3,

1. Select—from an extensive variety of prefilled Tub sterile cartridge-needle units.* No multi-dose vials to bother with; no unlabeled syringes to cause confusic

2. Inject—with a minimum of pain. Thanks to the single-use, stainless-steel needle that's both ultra-sharpened and siliconized. Aspirate simply and conveniently.

3. Throw away—empty cartridge-needle unit. Never used again, it can't transmit infection. And there's no clean-up job.



*For injectables not yet in the ever-expanding prefilled Tub line, empty sterile cartridge-needle units are available.

History of the Library of the Medical and Chirurgical Faculty of Maryland

During the past year a student from the University of Maryland School of Library and Information Sciences visited our library to research the historical information available toward the preparation of an assignment for a project on Maryland library history. We were pleased and a bit flattered that she had chosen to spend her efforts on this particular library.

Many days she spent digging into our files and history collection, often finding items we scarcely knew were around. Finally, when I returned from Amsterdam and the International Congress on Medical Librarianship, there was a copy of the paper by Mary Hope Wilson (Mrs. David) and also a note announcing the arrival of a young son. Fortunately, he was considerate enough to let his mother finish her library school semester and our history before arriving!

The paper presents a very clear picture of the evolution of this library, written in easy, flowing style. We are grateful for this study and it will be made available for circulation later.

MEDIC Tapes and Slides now Available

Med-Chi Library now has a complete collection of the slides and tapes used with the MEDIC programs. These may be borrowed by physicians on the same basis as books, with a loan period of four weeks, and one renewal allowed, if needed. Please give full information on subject, name of lecturer if known, and date presented, so that no mistake will be made in identifying request. Also, these as well as other requests may be phoned in directly to the library via the MEDIC telephone line. Why don't you try this service?

Meetings

The Baltimore Hospital Librarians Association met September 25, 1969 at the U.S. Public Health Service Library.

The tentative date for the regional meeting of the Medical Library Association is November 22, 1969 in Bethesda. National Institutes of Health and National Library of Medicine are co-hosts.

Medical Library Association annual meeting will be held in Louisville, Kentucky, October 26-30, 1969 with headquarters in the Brown Hotel.

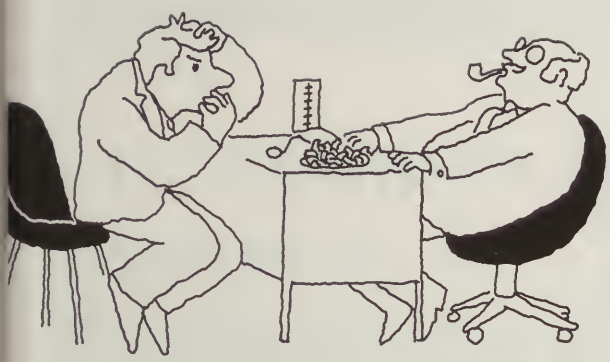
The Apprehensive Hypertensive



Regroton® to lower blood pressure

chlorthalidone 50 mg.
reserpine U.S.P. 0.25 mg.

Regroton®: chlorthalidone 50 mg., reserpine U.S.P. 0.25 mg.
Indications: Hypertension. *Contraindications:* History of mental depression, hypersensitivity, and most cases of severe renal or hepatic diseases. *Warning:* With the administration of enteric-coated potassium supplements, which should be used only when adequate dietary supplementation is not practical, the possibility of small-bowel lesions (obstruction, hemorrhage, and perforation) should be kept in mind. Surgery for these lesions has frequently been required and deaths have occurred. Discontinue coated potassium-containing formulations immediately if abdominal pain, distention, nausea, vomiting, or gastrointestinal bleeding occur. Discontinue one week before electroshock therapy, and if depression or peptic ulcer occurs. *Use in pregnancy:* Because chlorthalidone may cross the placental barrier and appear in cord blood and thiazides may appear in breast milk, this drug should be used with care in pregnant patients and nursing mothers. When used in women of childbearing age, the potential benefits of the drug should be weighed against the possible hazards to the fetus. Use of chlorthalidone may result in fetal or neonatal jaundice, thrombocytopenia, and possibly other adverse reactions which have occurred in the adult. Increase respiratory secretions, nasal congestion, cyanosis and anorexia ma occur in infants born to reserpine-treated mothers. *Precautions:* Antih pertensive therapy with this drug should always be initiated cautious in postsympathectomy patients and in patients receiving ganglion blocking agents, other potent antihypertensive drugs, or curare. Reduc dosage of concomitant antihypertensive agents by at least one-half. T avoid hypotension during surgery, discontinue therapy with this ager two weeks prior to elective surgical procedures. In emergency surger use, if needed, anticholinergic or adrenergic drugs or other supportiv measures as indicated. Because of the possibility of progression renal damage, periodic kidney function tests are indicated. Discontinu if the BUN rises or liver dysfunction is aggravated. Hepatic coma ma be precipitated. Electrolyte imbalance, sodium and/or potassium de pletion may occur. If potassium depletion should occur during therap the drug should be discontinued and potassium supplements giver provided the patient does not have marked oliguria. Take particular car in cirrhosis or severe ischemic heart disease and in patients receivin

WE'VE GOT TO GET PLENTY OF REST AND TRY TO AVOID SITUATIONS THAT MAKE US ANXIOUS OR TENSE. AND WE'LL TAKE MEDICINE TO LOWER OUR BLOOD PRESSURE AND CALM US DOWN.

;nd allay anxiety in hypertension

c.icosteroids, ACTH, or digitalis. Severe salt restriction is not recom-
rnded. Use cautiously in patients with ulcerative colitis or gallstones
(iary colic may be precipitated). Bronchial asthma may occur in
sceptible patients. *Adverse Reactions:* The drug is generally well
trated. The most frequent side effects are nausea, gastric irritation,
viiting, diarrhea, constipation, muscle cramps, headache, dizziness
a acute gout. Other potential side effects include angina pectoris,
aiety, depression, bradycardia and ectopic cardiac rhythms (espe-
cly when used with digitalis), drowsiness, dull sensorium, hypergly-
cnia and glycosuria, hyperuricemia, lassitude, restlessness, transient
nopia, impotence or dysuria, orthostatic hypotension which may be
pentiated when chlorthalidone is combined with alcohol, barbiturates
narcotics, leukopenia, aplastic anemia, skin rashes, thrombocyto-
pia, agranulocytosis, nasal stuffiness, increased gastric secretions,
ntmare, purpura, urticaria, ecchymosis, weakness, uveitis, optic
aophy and glaucoma, and pruritus. Eruptions and/or flushing of the
sn, a reversible paralysis agitans-like syndrome, blurred vision, con-
jctival injection, increased susceptibility to colds, dyspnea, weight gain, decreased libido, dryness of the mouth, deafness, anorexia, and pancreatitis when epigastric pain or unexplained G.I. symptoms develop after prolonged administration. Jaundice, xanthopsia, paresthesia, photosensitization and necrotizing angiitis are possible. *Average Dosage:* One tablet daily with breakfast. *Availability:* Pink, single-scored tablets in bottles of 100 and 1000. (B) 46-600-C

Man Against Machine: International Accident Symposium

SUSAN P. BAKER, MPH
Research Associate, Division of Forensic Pathology
The Johns Hopkins School of Hygiene and Public Health

The Third Triennial Congress of the International Association for Accident and Traffic Medicine was held in New York from May 29-June 1. World-wide representation and a wide variety of topics added to the interest of the meeting.

John D. States and Ralph Sweetland, from the University of Rochester Medical School, described the extremely high risk of injury in rollover crashes. Forty percent of the occupants of cars which rolled over in highway mishaps were hospitalized or killed, compared to about 20% of the racing drivers whose cars rolled over. Since the average speed at the time of rollover was much greater for the racing cars (93 mph compared to 66 mph), the reason for the greater safety of their drivers was investigated.

The authors concluded that the use of restraint systems was the single most effective means of protection in rollovers; all 47 racing drivers were wearing lapbelts, and nearly half wore shoulder harnesses as well. Only 7 of the 41 persons in highway rollovers wore lapbelts; the most serious injury sustained by any of the seven was an acromioclavicular separation. Of 14 ejected persons, 2 were killed and the remainder hospitalized. Occupants were ejected from four out of five convertibles which rolled over in highway accidents. (The fifth involved an unusual type of restraint—seven people were packed so tightly into an Austin Healey that ejection could not occur.) Preservation of occupant space was also found to be important and was achieved in the racing cars by rollbars.

Kenneth G. Jamieson, from the Royal Brisbane Hospital, reported a study of 1000 consecutive victims who were killed or hospitalized in Brisbane, Australia. There were 188 deaths, about half of which occurred before the victims reached the hospital. Asphyxia and hemmorhage were the greatest problems in ambulance and emergency treatment. Head injury was of major concern because it was the most common injury and most often fatal, as well as producing the most protracted morbidity.

Volkswagens were involved in twice as many collisions with either cars or pedestrians, as would have been expected on the basis of vehicle registrations. Oversteering characteristics of the vehicle were evidenced by the injury patterns of Volkswagen occupants. The drivers sustained a low incidence of chest injuries, apparently because lateral spin before impact caused a sideways collision.

Medical examinations for drivers were considered to be contraindicated by the finding that only six of the collisions were associated with acute medical conditions, and only three of these could have been predicted by prior examinations. One fourth of all drivers who caused crashes, to which an ambulance was called, had criminal records. The irresponsible drivers, social deviates, and potential alcoholics who were

found in large numbers among those responsible for major collisions were believed to be unaffected by most deterrent measures. Recent alcohol legislation in Brisbane has apparently had its main effect on the somewhat more responsible drivers whose collisions are less likely to prove fatal.

Julian A. Waller, of the University of Vermont College of Medicine, gave further evidence of the association between violence and poor driving records. Persons involved in shooting accidents were far more likely to have had crashes, received citations for serious driving offenses, and had their licenses suspended than were a control group of drivers. Of those who had accidentally shot themselves or someone else, 32% had police records for actions involving intentional violence and 21% for alcohol abuse. The study suggests that "in specific situations, perhaps commonly involving alcohol, poor control of aggressive tendencies results in intentional acts of violence and in unintentional injury both on the highway and elsewhere."

One of the major implications of these papers is that prevention of serious and fatal highway injuries is more likely to be achieved by separating the occupant from inhospitable surfaces and reducing the energy exchanges involved, than by attempting to influence the irresponsible drivers who play a leading role in the most violent crashes.

DO YOU NEED

If you are a doctor or dentist or supervise a staff in a hospital or nursing home, there are times when you have wished that help was a phone call away. Now it is. Call us night or day for the nursing or medical office employees you need. Our service is national, our employees are experienced, screened, insured and bonded.

SLEEP ZONE

To turn a hospital zone into a sleep zone, you need more than peace and quiet. Your patients need a mattress which gives the right kind of firm, comfortable support. To hospitals across the country, this means the Serta Perfect Sleeper "Hospital" mattress.

It provides restful, healthful sleep, because the patient sleeps **on** it, not in it. And just as important to you, the Serta Perfect Sleeper retains its firmness for years and years of service.

Interested? There's a Serta contract bedding expert near you. Let him help you choose from the comprehensive range of specifications on Serta quality bedding.

Dulcolax®...so predictable you can almost set patients by it.

Dulcolax works so effectively that the time of bowel evacuation can often be predicted.

Dulcolax tablets taken at night will usually result in a convenient bowel movement the following morning. Dulcolax suppositories generally work within 15 minutes to an hour.

Dulcolax may be given to the aged, pregnant or nursing women, and children. It may be particularly helpful in conditions in which straining should be avoided. The drug, however, is contraindicated in the acute surgical abdomen.

Dulcolax® bisacodyl

AMBAR #2 EXTENTABS®

methamphetamine HCl 15 mg., phenobarbital 64.8 mg. (1 gr.) (Warning: may be habit forming).

One Ambar Extentab before breakfast can help control most patients' appetite for up to 12 hours. Methamphetamine, the appetite suppressant, gently elevates mood and helps overcome dieting frustrations. Phenobarbital, the sedative in Ambar, controls irritability and anxiety...helps maintain a state of mental calm and equanimity. Both work together to ease the tensions that erode the willpower during periods of dieting.

Also available: Ambar #1 Extentabs®—methamphetamine hydrochloride 10 mg., phenobarbital 64.8 mg. (1 gr.) (Warning: may be habit forming).

BRIEF SUMMARY/**Indications:** Amba suppresses appetite and helps offset emo tional reactions to dieting. **Contraindic tions:** Hypersensitivity to barbiturates c sympathomimetics; patients with advance renal or hepatic disease. **Precautions:** Administer with cau tion in the presence of cardiovascular disease or hypertensio **Side Effects:** Nervousness or excitement occasionally note but usually infrequent at recommended dosages. Slight drow iness has been reported rarely. See package insert for furth details.

Disaster Training

The American College of Surgeons, in a resolution adopted by the Board of Regents, has stressed its support of programs relating to the training in disaster medicine. The college expressed its opinion on this matter because federal support for the Medical Education for National Defense (MEND) program has been eliminated from the current federal budget.

MEND was initiated in 1952 by the Department of Defense as a pilot project which provided funds to five medical schools for the development of informal programs of medical education for national defense. By 1965, 89 medical schools were participating in the program.

The resolution, which was sent to federal agencies responsible for the administration of the program, reads as follows:

"RESOLVED, that the Board of Regents of the American College of Surgeons support programs of appropriate training of medical students, interns, residents and doctors in practice in the practice of medicine and surgery under adverse emergency conditions, such as may occur in a military or civil disaster situation."

Last year BLUE SHIELD® paid $20 million in doctor bills for its members

Blue Shield membership is a genuine bargain: Ninety cents out of every dollar paid in by members is *paid back* in the form of receipted doctor bills. No wonder more than one million Marylanders protect themselves against unexpected medical-surgical expenses by belonging to Blue Shield. No wonder 300 of the nation's 500 largest corporations carry Blue Shield for their employees.

The unselfish devotion of Maryland doctors who serve as Blue Shield board and committee members without remuneration is a very important contributing factor to Blue Shield's low administrative expenses.

To find out more about Blue Shield, just use the coupon.

The "Monday Syndrome": A Reality

Are you suffering from "Monday syndrome"?

There may be such a thing, reports the Health Insurance Institute.

A study of 500 workmen's compensation reports from the files of a large insurance company suggests the possibility.

This syndrome is now being used to explain what you may have realized—that Monday is the worst day in the week to return to work after an illness, accident or vacation.

There appears to be some relationship between Monday being the first day back and a higher incidence of accidents, lower production and increased cost of production.

As a consequence, this insurance company is advising physicians to reconsider prescribing Mondays as back-to-work days for patients recovering from illnesses and injuries.

The insurance company also noted that 54% of all injured workers in its study return to work on Monday.

According to a spokesman for the insurance company:

"Plenty of physicians, if they thought about it, would actually prefer to have the patient go back to work on a Thursday or Friday after a period of incapacity and have the advantage of a weekend's rest before barging into a full week."

For elderly patients in need of a mild tranquilizer consider **Tybatran®**

brand of tybamate

(When you consult the Prescribing Information you may agree it makes good sense)

PRESCRIBING INFORMATION

Indications: Tybatran (tybamate) has afforded symptomatic improvement in a variety of psychoneurotic disorders, especially in the treatment of the anxiety and tension components of psychoneuroses. Anxiety states manifested somatically have responded to Tybatran (tybamate).

Tybatran (tybamate) has been useful in the control of agitation in the aged and in the alleviation of some of the adverse emotional accompaniments of senility.

Tybatran (tybamate) has been used with benefit in the treatment of depressive symptoms associated with anxiety and other symptoms of psychoneuroses. However, it is not indicated for primary treatment of depressive states. It is not an antipsychotic agent, although it has been used as adjunctive therapy in some psychotic patients.

Dosage: One 350 mg. capsule, 3 times daily and two at bedtime is suggested as the adult starting dose. Adjust to suit individual requirements. Daily doses above 3000 mg. are not recommended.

Contraindications: Known hypersensitivity to tybamate. Since no studies have been done with this drug in human pregnancy, it should not be used in pregnancy unless the potential benefit outweighs the risk.

Warnings: Administer cautiously to patients receiving phenothiazines or other CNS depressants or having history of convulsive seizures (See Adverse Reactions). Consider possibility of additive actions with alcohol or other psychotropic agents, particularly phenothiazines or MAO inhibitors.

Precautions: Avoid abrupt withdrawal after prolonged use, although withdrawal symptoms have not been reported to date. Exercise caution in addiction-prone individuals. If symptoms of hypersensitivity occur, discontinue at once and initiate appropriate symptomatic treatment. Avoid activities requiring optimal mental alertness if drowsiness or vertigo are present. As with any new drug, use cautiously in patients with history of drug allergies, blood dyscrasias, and hepatic or renal disease; periodic measurements of hepatic, hematopoietic and renal function should accompany prolonged and/or high doses.

Adverse Reactions: Most frequent reactions, rarely requiring discontinuation of tybamate, include drowsiness, dizziness, nausea, insomnia, and euphoria. There have been a few reports of skin rash, urticaria, and pruritus. Rare side effects include hyperactivity, fidgetiness, flushing, and tachycardia, suggesting excessive stimulation; also ataxia, unsteadiness, confusion, feeling of unreality, "panic reaction," fatigue, headache, paresthesias, vertigo, gastrointestinal disturbances, glossitis, and dry mouth. Grand mal or petit mal seizures have been reported in a few hospitalized psychotic patients receiving tybamate (up to 6000 mg. daily) together with phenothiazines and other psychotropic agents, but not with tybamate alone. Consider the possibility of rare, serious adverse reactions such as may occur with the related drug, meprobamate. If excessive amounts are ingested, gastric lavage and symptomatic therapy, including central stimulants as necessary, are recommended. Before prescribing, consult package circular.

Supply: Tybatran (tybamate) is available in green, sealed capsules of three strengths: 350 mg., 250 mg., and 125 mg. Each strength is supplied in bottles of 100 and 500.

A. H. Robins Company, Richmond, Va. 23220

For the "Cheater Eater"

Formulas: Each 'Dexamyl' *Spansule* capsule No. 1 contains 10 mg. of Dexedrine® (brand of dextroamphetamine sulfate) and 1 gr. of amobarbital, derivative of barbituric acid (Warning, may be habit forming). Each 'Dexamyl' *Spansule* capsule No. 2 contains 15 mg. of Dexedrine (brand of dextroamphetamine sulfate) and 1½ gr. of amobarbital (Warning, may be habit forming).
Before prescribing, see complete prescribing information in SK&F literature or *PDR*.
Contraindications: Hyperexcitability, undue restlessness, hyperthyroidism, porphyria; in patients on MAO inhibitors.
Precautions: Use with caution in patients hypersensitive to sympathomimetics or barbiturates and in coronary or cardiovascular disease or severe hypertension. Excessive use of the amphetamines by unstable individuals may result in a psychological dependence. Rarely, symptoms of toxic psychosis (hallucinations, confusion, panic states, etc.) may occur with amphetamines, usually after prolonged high dosage. In these instances, withdraw the medication. Use cautiously in pregnant patients, especially in the first trimester.
Adverse Reactions: Overstimulation, restlessness, insomnia, g.i. disturbances, diarrhea, palpitation, tachycardia, elevated blood pressure, tremor, sweating, impotence and headache.
Supplied: In bottles of 50.

"Survey of Hospital Charges..." Offered

The Health Insurance Council has announced publication of "Survey of Hospital Charges as of December 1968," an itemized breakdown of hospital expenses throughout the nation.

The book details costs—including X-ray, drug and laboratory—in terms of average hospital charges. It divides the United States into census division, state, and standard metropolitan statistical areas including the nation's 25 largest counties.

The national survey also reports on charges for intensive care and extended care units as well as average daily service charges in both voluntary and proprietary hospitals.

It was prepared by the American Hospital Association for the Council.

To obtain a copy, write to William W. Reinertson, Health Insurance Council, 750 Third Avenue, New York, N.Y. 10017.

The price is $10 for the first copy and $5 for each additional copy.

Women Drivers Hav

Perhaps the oldest joke in 20th-century America is the woman driver put-on, according to The Travelers Insurance Companies annual booklet on highway accident statistics.

Of the 68,000 drivers involved in fatal accidents in 1968, only 10,000 were women.

However, a spokesman notes that "the big gun in this battle of the sexes is the canard that women are emotionally incapable of handling a car in an emergency. Or that an ignorance of anything mechanical makes it impossible for them to understand how to drive safely.

"Some women *do* get rattled easily," the spokesman concedes. "Some women *are* bewildered by

ewer Accidents

nuts and bolts. And precisely the same can be said for some men," he added.

Statistics in the booklet prove many reasons why cars crash: speed too fast for conditions; driving on the wrong side of the road; did not have the right of way; cutting into a line of traffic; passing on curve or hill; passing on wrong side; failure to signal and improper signaling; reckless driving, etc. Sex of the driver is not a proven reason.

"The fact is," the spokesman said, "there are many more male drivers who drive many more miles than the average female. Until we have figures indicating the number of miles driven by male vs. female, the woman-driver joke will remain no more than a put-on."

For your next meeting, banquet or convention . . . consider

from the discord of anxiety...

to emotional harmony

with the aid of antianxiety

Librium®
(chlordiazepoxide HCl)
5-mg, 10-mg and 25-mg capsules

In an age of swift change and challenge, susceptible individuals may experience varying degrees of excessive anxiety. The resulting emotional stress may precipitate significant functional disorders or complicate existing organic disease. In properly individualized maintenance dosage, Librium (chlordiazepoxide HCl) quickly helps relieve anxiety and apprehension, provides useful adjunctive therapy in psychophysiologic disorders—yet seldom impairs mental acuity or ability to function. Librium has demonstrated a wide margin of safety in short- and long-term therapy.

Also available:

Libritabs®
(chlordiazepoxide)

ROCHE
Roche
LABORATORIES
Division of Hoffmann-La Roche Inc.
Nutley, New Jersey 07110

Before prescribing, please consult complete product information, a summary of which follows:

Indications: Indicated when anxiety, tension and apprehension are significant components of the clinical profile.

Contraindications: Patients with known hypersensitivity to the drug.

Warnings: Caution patients about possible combined effects with alcohol and other CNS depressants. As with all CNS-acting drugs, caution patient against hazardous occupations requiring complete mental alertness (e.g., operating machinery, driving). Though physical and psychological dependence have rarely been reported on recommended doses, use caution administering to addiction-prone individuals or those who might increase dosage; withdrawal symptoms (including convulsions), following discontinuation of the drug and similar to those seen with barbiturates, have been reported. Use of any drug in pregnancy, lactation, or in women of childbearing age requires that its potential benefits be weighed again its possible hazards.

Precautions: In the elderly and debilitated, and in children over six, limit t smallest effective dosage (initially 10 mg or less per day) to preclude ata or oversedation, increasing gradually as needed and tolerated. Not recommended in children under six. Though generally not recommended, combination therapy with other psychotropics seems indicated, carefully consider individual pharmacologic effects, particularly in use of potentiat drugs such as MAO inhibitors and phenothiazines. Observe usual precautions in presence of impaired renal or hepatic function. Paradoxical reactions (e.g., excitement, stimulation and acute rage) have been reported in psychiatric patients and hyperactive aggressive children. Emp usual precautions in treatment of anxiety states with evidence of impend ing depression; suicidal tendencies may be present and protective measu necessary. Variable effects on blood coagulation have been reported ver rarely in patients receiving the drug and oral anticoagulants; causal rela tionship has not been established clinically.

Adverse Reactions: Drowsiness, ataxia and confusion may occur, especia in the elderly and debilitated. These are reversible in most instances by proper dosage adjustment, but are also occasionally observed at the low dosage ranges. In a few instances syncope has been reported. Also encountered are isolated instances of skin eruptions, edema, minor menstru irregularities, nausea and constipation, extrapyramidal symptoms, incre and decreased libido—all infrequent and generally controlled with dosa reduction; changes in EEG patterns (low-voltage fast activity) may appea during and after treatment; blood dyscrasias (including agranulocytosis), jaundice and hepatic dysfunction have been reported occasionally, maki periodic blood counts and liver function tests advisable during protracted therapy.

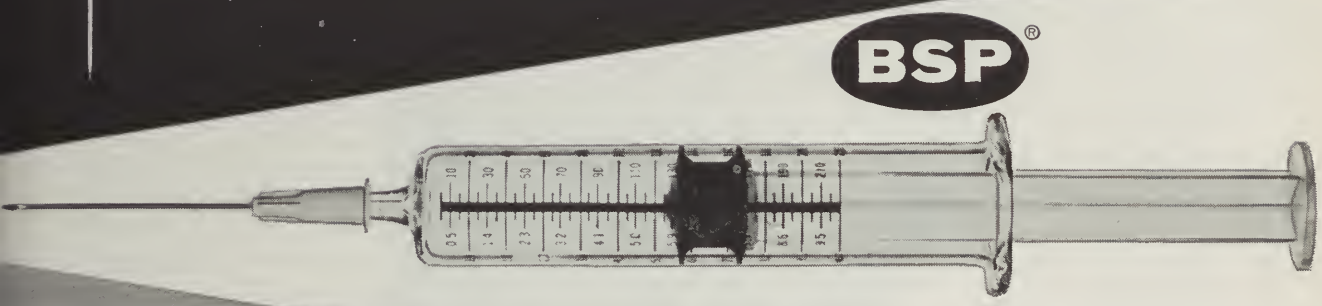
the right attitude:

The right attitude has earned us an enviable reputation in Baltimore's wide spectrum of health care establishments. We feel that our approach to the problems of the elderly, chronically ill, and convalescent patient makes us different.

Our *people* are not only doing a job but also giving of themselves beyond the call of duty to provide our guests with more than the average amount of service expected.

If the right attitude is what you're looking for . . . concerning a day & night vigil by professional nurses . . . individually programmed meals under the control of our staff dietician — physical, occupational, recreational therapy designed to reach a goal in the patient's care and well-being . . . a pleasant home-away-from-home atmosphere . . . Edgewood Nursing Home should be your first preference.

WATCH FOR OUR GRAND OPENING:



By the first of the year — our completely new 100 bed facility will be finished — we are Baltimore's most centrally located nursing home. Minutes from Towson. Roland Park, Homeland and all of Northern Baltimore's hospitals.

He is elderly.
He is on corticosteroids.
When he needs an antibiotic
he may be a candidate for

DECLOSTATIN® 300 b.i.d.

Demethylchlortetracycline HCl 300 mg
and Nystatin 500,000 units
CAPSULE-SHAPED TABLETS Lederle

To guard susceptible patients against intestinal monilial overgrowth during broad-spectrum therapy—the protection of nystatin is combined with demethylchlortetracycline in DECLOSTATIN.

For your susceptible candidates, prescribe DECLOSTATIN —the broad-spectrum therapy that prevents monilial overgrowth.

Effectiveness: Because its antibacterial component is DECLOMYCIN Demethylchlortetracycline, DECLOSTATIN should be equally or more effective therapeutically than other tetracyclines in infections caused by tetracycline-sensitive organisms. The antifungal component, Nystatin, protects against superinfection by antibiotic-resistant fungal overgrowth (particularly monilia) in the intestinal tract.

Contraindication: History of hypersensitivity to demethylchlortetracycline or nystatin.

Warning: In renal impairment, usual doses may lead to excessive accumulation and liver toxicity. Under such conditions, lower than usual doses are indicated, and, if therapy is prolonged, serum level determinations may be advisable. A photodynamic reaction to natural or artificial sunlight has been observed. Small amounts of drug and short exposure may produce an exaggerated sunburn reaction which may range from erythema to severe skin manifestations. In a smaller proportion, photoallergic reactions have been reported. Patients should avoid direct exposure to sunlight and discontinue drug at the first evidence of skin discomfort. Necessary subsequent courses of treatment with tetracyclines should be carefully observed.

Precautions: Overgrowth of nonsusceptible organisms may occur. Constant observation is essential. If new infections appear, appropriat measures should be taken. In infants, increased intracranial pressur with bulging fontanels has been observed. All signs and symptoms hav disappeared rapidly upon cessation of treatment.

Side Effects: Gastrointestinal system—anorexia, nausea, vomiting, diar rhea, stomatitis, glossitis, enterocolitis, pruritus ani. Skin—maculopap ular and erythematous rashes; a rare case of exfoliative dermatitis ha been reported. Photosensitivity; onycholysis and discoloration of th nails (rare). Kidney—rise in BUN, apparently dose related. Transien increase in urinary output, sometimes accompanied by thirst (rare Hypersensitivity reactions—urticaria, angioneurotic edema, anaphylaxi Teeth—dental staining (yellow-brown) in children of mothers given thi drug during the latter half of pregnancy, and in children given the dru during the neonatal period, infancy and early childhood. Enamel hypo plasia has been seen in a few children. If adverse reaction or idiosyn crasy occurs, discontinue medication and institute appropriate therap Demethylchlortetracycline may form a stable calcium complex in an bone-forming tissue with no serious harmful effects reported thus fa in humans.

Average Adult Daily Dosage: 150 mg q.i.d. or 300 mg b.i.d. Should b given 1 hour before or 2 hours after meals, since absorption is impaire by the concomitant administration of high calcium content drugs, food and some dairy products. Treatment of streptococcal infections shoul continue for 10 days, even though symptoms have subsided.

CONTENTS:

Death from Narcotics Use: Baltimore City, 1963 through 1968, Edward F. Wilson, MD, and Russell S. Fisher, MD 49

"Baltimore city, during 1968, experienced a staggering increase over past years in the number of deaths attributed directly to the use of narcotics. New York, Philadelphia, and Miami experienced similar increases. The purpose of this report is to document various parameters of Baltimore's increase."

Sacculotomy in the Treatment of Meniere's Disease, N. Edward Nachlas, MD, Mervin Trail, MD, and Donn Duncan, MD 53

"The treatment of Meniere's disease has long been a therapeutic enigma as testified to by the many and varied methods in use today. In this paper, the features of Meniere's disease will be discussed, with a recent surgical procedure reported that has yielded gratifying results in six patients."

Wound Disruption After Abdominal Laparotomies, Roberto O. Ferrer, MD 57

"The process of wound healing has a high biological priority. Most wounds heal completely within a relatively short period of time, in spite of preoperative starvation, infection, or increased force against their tensile strength. A few wounds do not heal, but disrupt. Many factors play a role in the disruption of a laparotomy wound: increased intra-abdominal pressure, metabolic state of the patient, wound infection, and surgical technique. . . . This paper is a comparison of the frequency of wound disruption after abdominal operations in St. Joseph Hospital with that reported in the literature, and an evaluation of the predisposing causes in an effort to present this complication."

Pulmonary Fibrosis Following Radiotherapy for Bronchogenic Carcinoma and Hodgkin's Disease, H. Gunter Seydel, MD, J. Maun, MD 61

"The incidence of moderate to severe pulmonary fibrosis following radiotherapy for mediastinal Hodgkin's disease was 68% in 21 patients. The corresponding incidence in 20 patients with bronchogenic carcinoma was 75%. Severe symptoms occurred in 10% of the patients with Hodgkin's disease one year after radiotherapy, while the incidence of severe symptoms among the patients with bronchogenic carcinoma was 30%. No patients died due to causes arising from the pulmonary fibrosis."

Emergency Room Problems of an "Inner Core" City Hospital, William E. Beaven, MD, Juan F. Sordo, MD, Patricia Wheltle, RN 63

"An in-depth analysis of the Emergency Department, Bon Secours Hospital."

(Continued on page 70.)

"All Interns are Alike"

It stands to reason. They all go through the same training; they all have to pass the same tests; they all have to measure up to the same standards; they all are underpaid, too. Therefore, all interns are alike.

That's utter nonsense, of course. But it's no more nonsensical than what some people say about aspirin. Namely: since all aspirin is at least supposed to come up to certain required standards, then all aspirin tablets must be alike.

Bayer's standards are far more demanding. In fact, there are at least *nine specific differences* involving purity, potency and speed of tablet disintegration. These Bayer® standards result in significant product benefits including gentleness to the stomach, and product stability that enables Bayer tablets to *stay* strong and gentle until they are taken.

So next time you hear someone say that all aspirin tablets are alike, you can say, with confidence, that it just isn't so.

You might also say that all interns aren't alike, either.

executive secretary's newsletter

October, 1969

LARIFICATION NEEDED

The effects of the Social Security Administration's Intermediary Letter 372, which limits medicare payments to teaching physicians, are being felt nationally by medical educators. According to the letter, a physician must be a patient's "attending physician" in order to receive payment for service. Carriers are required to substantiate claims of attending physicians by checking patient records to determine personal and identifiable services.

In a conversation on August 13, Bureau of Health Insurance Commissioner Thomas M. Tierney, told Ernest B. Howard, MD, Executive Vice-President of the AMA, that this was meant to apply to salaried physicians in a typical medical-school teaching center and not to the practicing physician on a fee-for-service basis in a community hospital with a graduate education program. Mr. Tierney indicated that a clarification of Letter 372 would be considered favorably. It is also reported that the HIBAC Council agrees that this is the intention of the letter.

'RY DUTY FOR PHYSICIANS

Effective July 1, 1969, physicians became liable for Jury duty and were no longer exempted under the laws of Maryland. The same exemption was also stricken from the books for dentists, policemen, attorneys, legislators and others, so that there are no blanket exemptions from this civic responsibility.

It is understood that physicians will be automatically granted exemption. However, under the provisions of the law, applications for exemption may be made on the basis of public need, if not automatically granted.

BORATORY ERVICES

According to State Health Department estimates, residents of Maryland spend approximately $49,000,000 per year for laboratory services. While a good portion of these services are paid for by third-party insurers, much of it is also paid on a personal basis by the patient himself.

HILD BUSE REPORTING

Physicians are reminded that they are required under Maryland law to report suspected cases of child abuse

CHILD ABUSE REPORTING (cont'd)

The local Department of Social Services is the agency charged with investigating such reports. Immunity from prosecution is provided under the law for those making reports in good faith. The intent of the law is to protect the child or siblings from further abuse. The fact that an abuser has been arrested and pending trial does not mean that the child is protected.

LETTERS IN MAIL ON PROFESSIONAL INCORPORATIONS

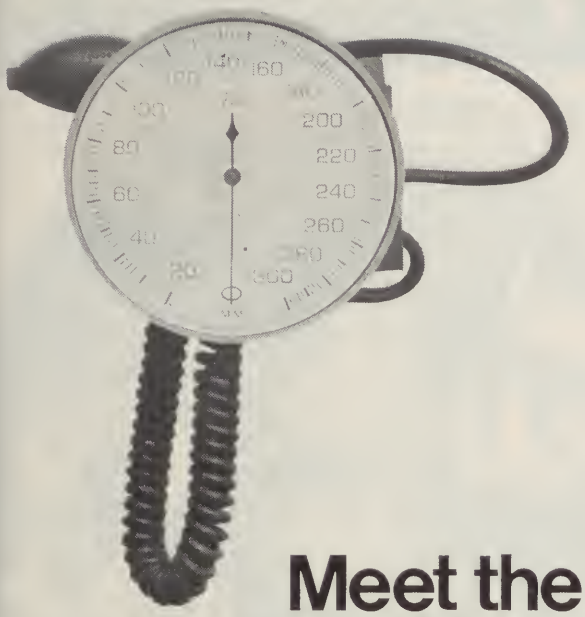
In the mail to all faculty members is a communication from the Med-Chi Insurance Trust. It offers an opportunity for personal consultation together with an attorney, tax counselor or others, on the advantages and disadvantages of professional incorporation as applied to an individual's practice.

You may return the card or call the Faculty office for an appointment.

STRANGE WORKINGS

The U.S. Government's Department of Agriculture spen $68.5 million last year to support the price of tobacco HEW and the same Agriculture Department together spent $6.3 million to discourage its use.

FAMILY PRACTICE CERTIFICATION



The American Board of Family Practice will give its first certification examination on February 28 through March 1, 1970. Information regarding the examinatio eligibility and where it will be given may be obtained from:

Nicholas J. Pisacano, M.D., Secretary
American Board of Family Practice, Inc.
University of Kentucky Medical Center

Lexington, Kentucky 40506

THE FALL GUY

Despite pressures and undue publicity directed against physicians for high costs of Medicaid and Medicare, only 11% of total costs of these programs go for physician's services.

John Sargeant
Executive Secretary

Meet the new Tycos wall mounted Aneroid. You can read it from anywhere in the room.

- Big 6¼" dial. Large black numerals on white background. Easy to read from anywhere in the room.
- Positive swivel action for setting in several positions on stainless steel bracket.
- Non-glare neutral case. No chrome. Shatterproof crystal. Simple in design and easy to clean.
- Visual check for accuracy — exclusive with all Tycos aneroids.
- Choice of hook or velcro cuffs. 6-foot coiled cord standard.

NOT A CURE ALL—BUT
THE BEST AIDE KNOWN

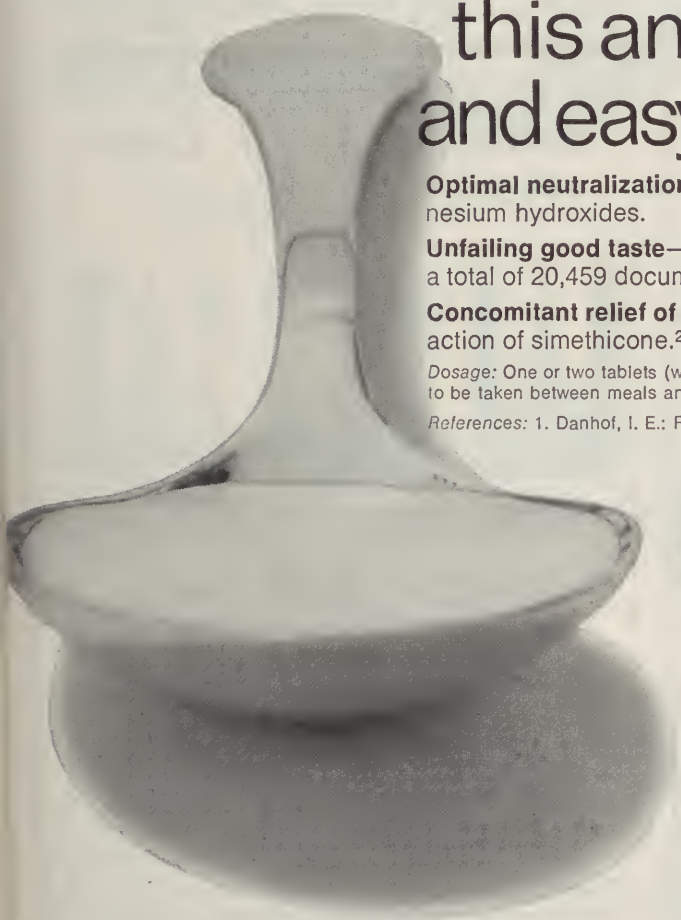
The AMBAR® SCRAPBOOK of Obesity Oddities
FACT & LEGEND

CONTROL FOOD AND MOOD ALL DAY LONG WITH A SINGLE MORNING DOSE

AMBAR #2 EXTENTABS®

methamphetamine HCl 15 mg., phenobarbital 64.8 mg. (1 gr.) (Warning: may be habit forming).

One Ambar Extentab before breakfast can help control most patients' appetite for up to 12 hours. Methamphetamine, the appetite suppressant, gently elevates mood and helps overcome dieting frustrations. Phenobarbital, the sedative in Ambar, controls irritability and anxiety...helps maintain a state of mental calm and equanimity. Both work together to ease the tensions that erode the willpower during periods of dieting.



Also available: Ambar #1 Extentabs®—methamphetamine hydrochloride 10 mg., phenobarbital 64.8 mg. (1 gr.) (Warning: may be habit forming).

BRIEF SUMMARY/**Indications:** Ambar suppresses appetite and helps offset emotional reactions to dieting. **Contraindications:** Hypersensitivity to barbiturates or sympathomimetics; patients with advanced renal or hepatic disease. **Precautions:** Administer with caution in the presence of cardiovascular disease or hypertension. **Side Effects:** Nervousness or excitement occasionally noted, but usually infrequent at recommended dosages. Slight drowsiness has been reported rarely. See package insert for further details.

A. H. ROBINS COMPANY, RICHMOND, VA. 23220 A·H·ROBINS

the thousandth teaspoonful

Peptic ulcer patients find the thousandth dose of this antacid as effective and easy-to-take as the first!

Optimal neutralization—provided by the combination of aluminum and magnesium hydroxides.

Unfailing good taste—confirmed by 87.5% of 104 patients in one study, after a total of 20,459 documented days on Mylanta Liquid or tablets.[1]

Concomitant relief of G. I. gas distress—provided by the proven antiflatulent action of simethicone.[2]

Dosage: One or two tablets (well chewed or allowed to dissolve in the mouth); one or two teaspoonfuls to be taken between meals and at bedtime, or as directed by physician.

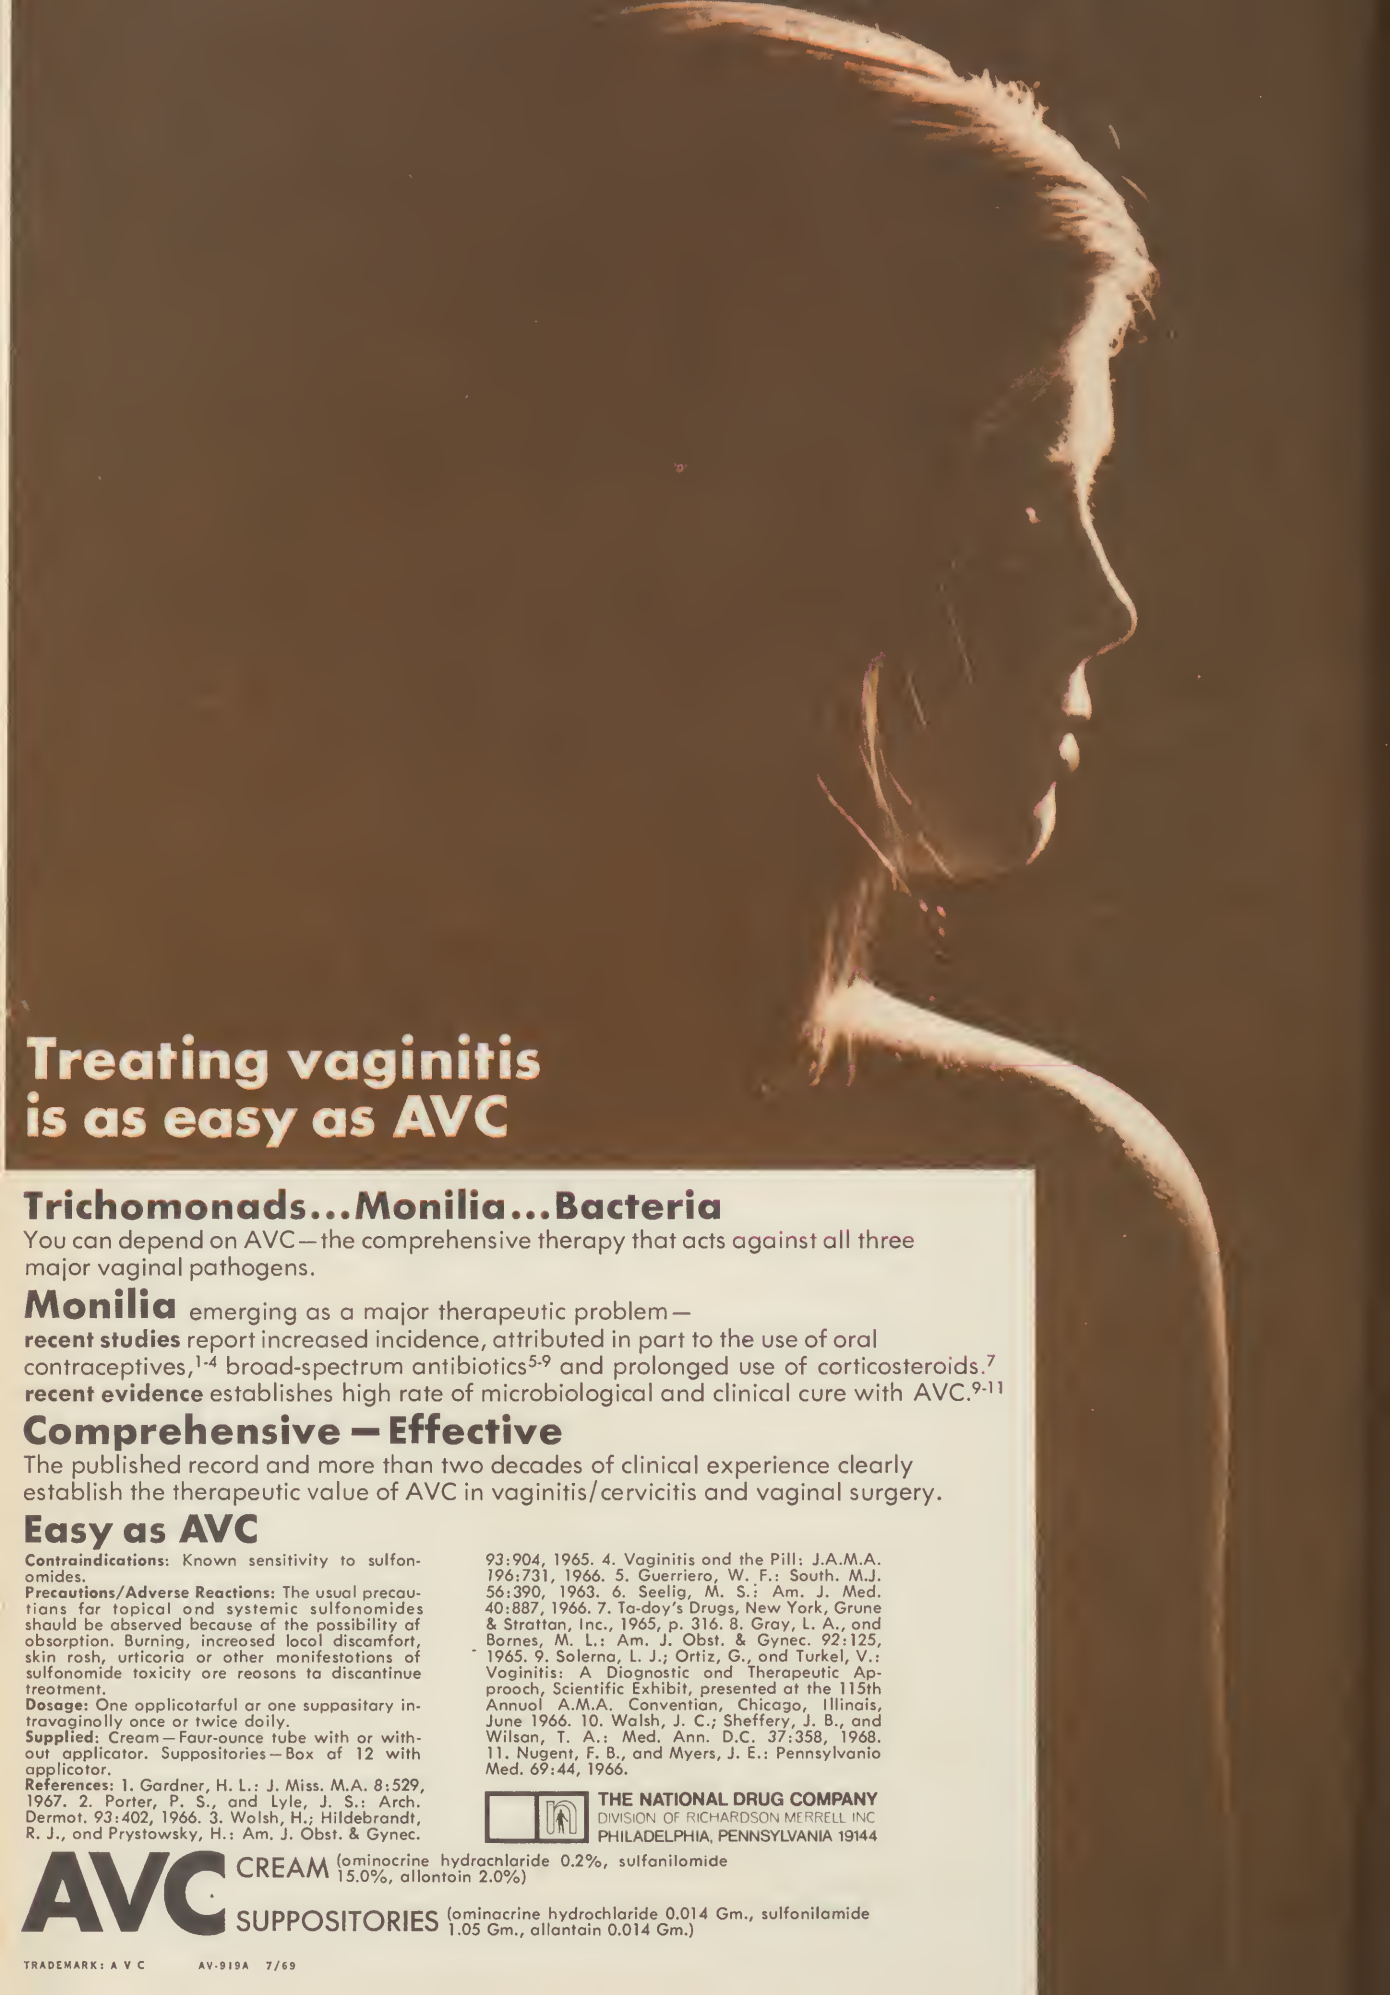
Painful night leg cramps...

unwelcome bedfellow for any patient– including those with arthritis, diabetes or PVD



One thing patients can sleep without, particularly patients with chronic disease conditions such as arthritis, diabetes or PVD, is painful night leg cramps. Although seldom the presenting complaint, night leg cramps can tie your patients up in painful knots. Now, just one tablet of QUINAMM at bedtime can usually bring an end to shattered sleep and needless suffering. Your patients will sleep restfully—gratefully—with QUINAMM, specific therapy to prevent painful night leg cramps.

Prescribing Information—Composition: Each white, beveled, compressed tablet contains: Quinine sulfate, 260 mg., Aminophylline, 195 mg. **Indications:** For the prevention and treatment of nocturnal and recumbency leg muscle cramps, including those associated with arthritis, diabetes, varicose veins, thrombophlebitis, arteriosclerosis and static foot deformities. **Contraindications:** QUINAMM is contraindicated in pregnancy because of its quinine content. **Precautions/Adverse Reactions:** Aminophylline may produce intestinal cramps in some instances, and quinine may produce symptoms of cinchonism, such as tinnitus, dizziness, and gastrointestinal disturbance. Discontinue use if ringing in the ears, deafness, skin rash, or visual disturbances occur. **Dosage:** One tablet upon retiring. Where necessary, dosage may be increased to one tablet following the evening meal and one tablet upon retiring. **Supplied:** Bottles of 100 and 500 tablets.

Quinamm™
(quinine sulfate 260 mg., aminophylline 195 mg.)

Specific therapy for night leg cramps

Treating vaginitis is as easy as AVC

Trichomonads...Monilia...Bacteria

You can depend on AVC—the comprehensive therapy that acts against all three major vaginal pathogens.

Monilia emerging as a major therapeutic problem—
recent studies report increased incidence, attributed in part to the use of oral contraceptives,[1-4] broad-spectrum antibiotics[5-9] and prolonged use of corticosteroids.[7]
recent evidence establishes high rate of microbiological and clinical cure with AVC.[9-11]

Comprehensive—Effective

The published record and more than two decades of clinical experience clearly establish the therapeutic value of AVC in vaginitis/cervicitis and vaginal surgery.

Easy as AVC

Contraindications: Known sensitivity to sulfonomides.
Precautions/Adverse Reactions: The usual precautians far topical ond systemic sulfonomides shauld be observed because af the possibility af obsorption. Burning, increased locol discamfort, skin rosh, urticoria or other monifestotions of sulfonomide toxicity ore reosons to discantinue treotment.
Dosage: One applicotarful or one suppasitary intravaginolly once or twice doily.
Supplied: Cream—Faur-ounce tube with or without applicator. Suppositories—Box af 12 with applicotor.

THE BREAKUP of a business partnership, the crack-up of a marriage, the shake-up of being fired or reduced to bankruptcy... after any significant loss or severe blow to self-esteem, *both* anxiety and depression almost always follow.

FOR MODERATE TO SEVERE ANXIETY WITH COEXISTING DEPRESSION

TRIAVIL®

TRANQUILIZER-ANTIDEPRESSANT

Containing perphenazine and amitriptyline HCl

For prescribing information, including indications, contraindications, warnings, precautions, and side effects, please see following page.

FOR MODERATE TO SEVERE ANXIETY WITH COEXISTING DEPRESSION

TRIAVIL®

TRANQUILIZER-ANTIDEPRESSANT

Containing perphenazine and amitriptyline HCl

TRIAVIL®2-25: Each tablet contains 2 mg. of perphenazine and 25 mg. of amitriptyline hydrochloride.

TRIAVIL®4-25: Each tablet contains 4 mg. of perphenazine and 25 mg. of amitriptyline hydrochloride.

TRIAVIL®2-10: Each tablet contains 2 mg. of perphenazine and 10 mg. of amitriptyline hydrochloride.

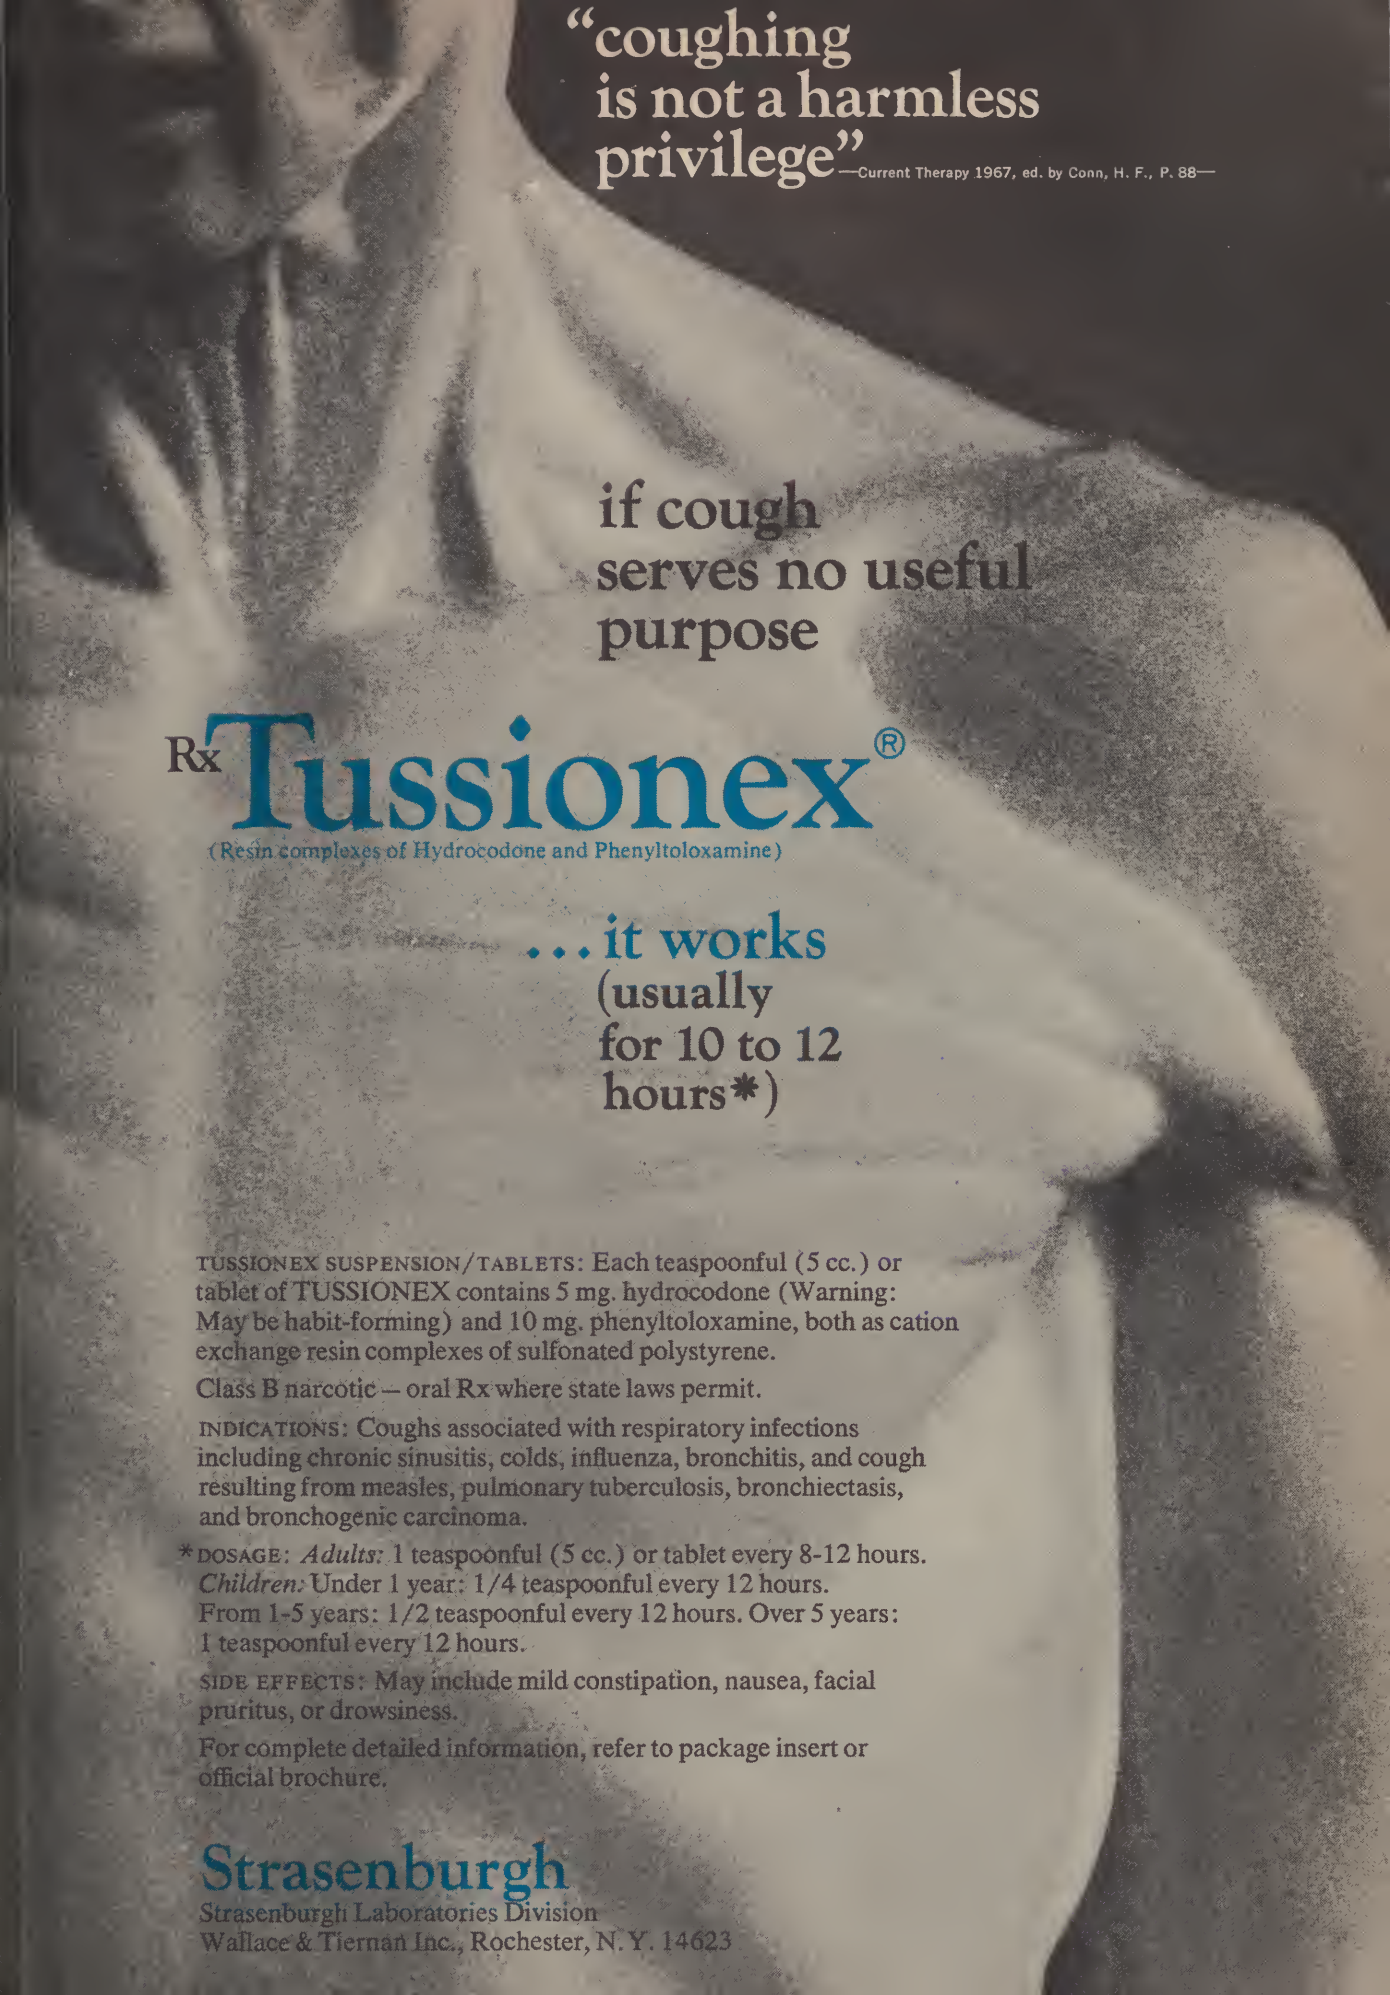
TRIAVIL®4-10: Each tablet contains 4 mg. of perphenazine and 10 mg. of amitriptyline hydrochloride.

INDICATIONS: Patients with moderate to severe anxiety and/or agitation and depressed mood; patients with depression in whom anxiety and/or agitation are severe; patients with depression and anxiety in association with chronic physical disease; schizophrenics with associated depressive symptoms.

CONTRAINDICATIONS: Central nervous system depression from drugs (barbiturates, alcohol, narcotics, analgesics, antihistamines); bone marrow depression; urinary retention; pregnancy; glaucoma. Do not give in combination with MAOI drugs because of possible potentiation that may even cause death. Allow at least 2 weeks between therapies. In such patients therapy with TRIAVIL should be initiated cautiously, with gradual increase in the dosage required to obtain a satisfactory response.

WARNINGS: Patients should be warned against driving a car or operating machinery or apparatus requiring alert attention, and that response to alcohol may be potentiated.

PRECAUTIONS: Suicide is always a possibility in mental depression and may remain until significant remission occurs. Supervise patients closely in case they may require hospitalization or concomitant electroshock therapy. Untoward reactions have been reported after the combined use of antidepressant agents having various modes of activity. Accordingly, consider possibility of potentiation in combined use of antidepressants. Not recommended for use in children. Mania or hypomania may be precipitated in manic-depressives (perphenazine in TRIAVIL seems to reduce likelihood of this effect). If hypotension develops, epinephrine should not be employed,as its action is blocked and partially reversed by perphenazine. Caution patients about errors of judgment due to change in mood.



SIDE EFFECTS: Similar to those reported with either constituent alone.

Perphenazine: Should not be used indiscriminately. Use caution in patients with history of convulsive disorders or severe reactions to other phenothiazines. Likelihood of untoward actions greater with high doses. Closely supervise with any dosage. Side effects may be any of those reported with phenothiazine drugs: blood dyscrasias (pancytopenia, thrombocytopenic purpura, leukopenia, agranulocytosis, eosinophilia); liver damage (jaundice, biliary stasis); extrapyramidal symptoms (opisthotonos, oculogyric crisis, hyperreflexia, dystonia, akathisia, dyskinesia, parkinsonism) usually controlled by the concomitant use of effective antiparkinsonian drugs and/or by reduction in dosage, but sometimes persist after discontinuation of the phenothiazine; severe acute hypotension (of particular concern in patients with mitral insufficiency or pheochromocytoma); skin disorders (photosensitivity, itching, erythema, urticaria, eczema, up to exfoliative dermatitis); other allergic reactions (asthma, laryngeal edema, angioneurotic edema, anaphylactoid reactions); peripheral edema; reversed epinephrine effect; endocrine disturbances (lactation, galactorrhea, disturbances of menstrual cycle); grand mal convulsions; cerebral edema; altered cerebrospinal fluid proteins; polyphagia; paradoxical excitement; photophobia; skin pigmentation; failure of ejaculation; EKG abnormalities (quinidine-like effect); reactivation of psychotic processes; catatonic-like states; autonomic reactions such as dryness of the mouth, headache, nausea, vomiting, constipation, obstipation, urinary frequency, blurred vision, nasal congestion, and a change in the pulse rate; hypnotic effects; pigmentary retinopathy; corneal and lenticular pigmentation; occasional lassitude; muscle weakness; mild insomnia; significant unexplained rise in body temperature may suggest intolerance to perphenazine, in which case discontinue. Antiemetic effect may obscure signs of toxicity due to overdosage of other drugs or make diagnosis of other disorders such as brain tumors or intestinal obstruction difficult. May potentiate central nervous system depressants (opiates, analgesics, antihistamines, barbiturates, alcohol), atropine, heat, and phosphorous insecticides.

Amitriptyline: Careful observation of all patients recommended. Side effects include drowsiness (may occur within the first few days of therapy); dizziness; nausea; excitement; hypotension; fainting; fine tremor; jitteriness; weakness; headache; heartburn; anorexia; increased perspiration; incoordination; allergic-type reactions manifested by skin rash, swelling of face and tongue, itching; numbness and tingling of limbs, including peripheral neuropathy; activation of latent schizophrenia (however, the perphenazine content may prevent this reaction in some cases); epileptiform seizures in chronic schizophrenics; temporary confusion, disturbed concentration, or transient visual hallucinations on high doses; evidence of anticholinergic activity, such as tachycardia, dryness of mouth, blurring of vision, urinary retention, constipation, paralytic ileus; agranulocytosis; jaundice. The antidepressant activity may be evident within 3 or 4 days or may take as long as 30 days to develop adequately, and lack of response sometimes occurs. Response to medication will vary according to severity as well as type of depression present. Elderly patients and adolescents can often be managed on lower dosage levels.

For more detailed information consult your Merck Sharp and Dohme representative or see the package circular.

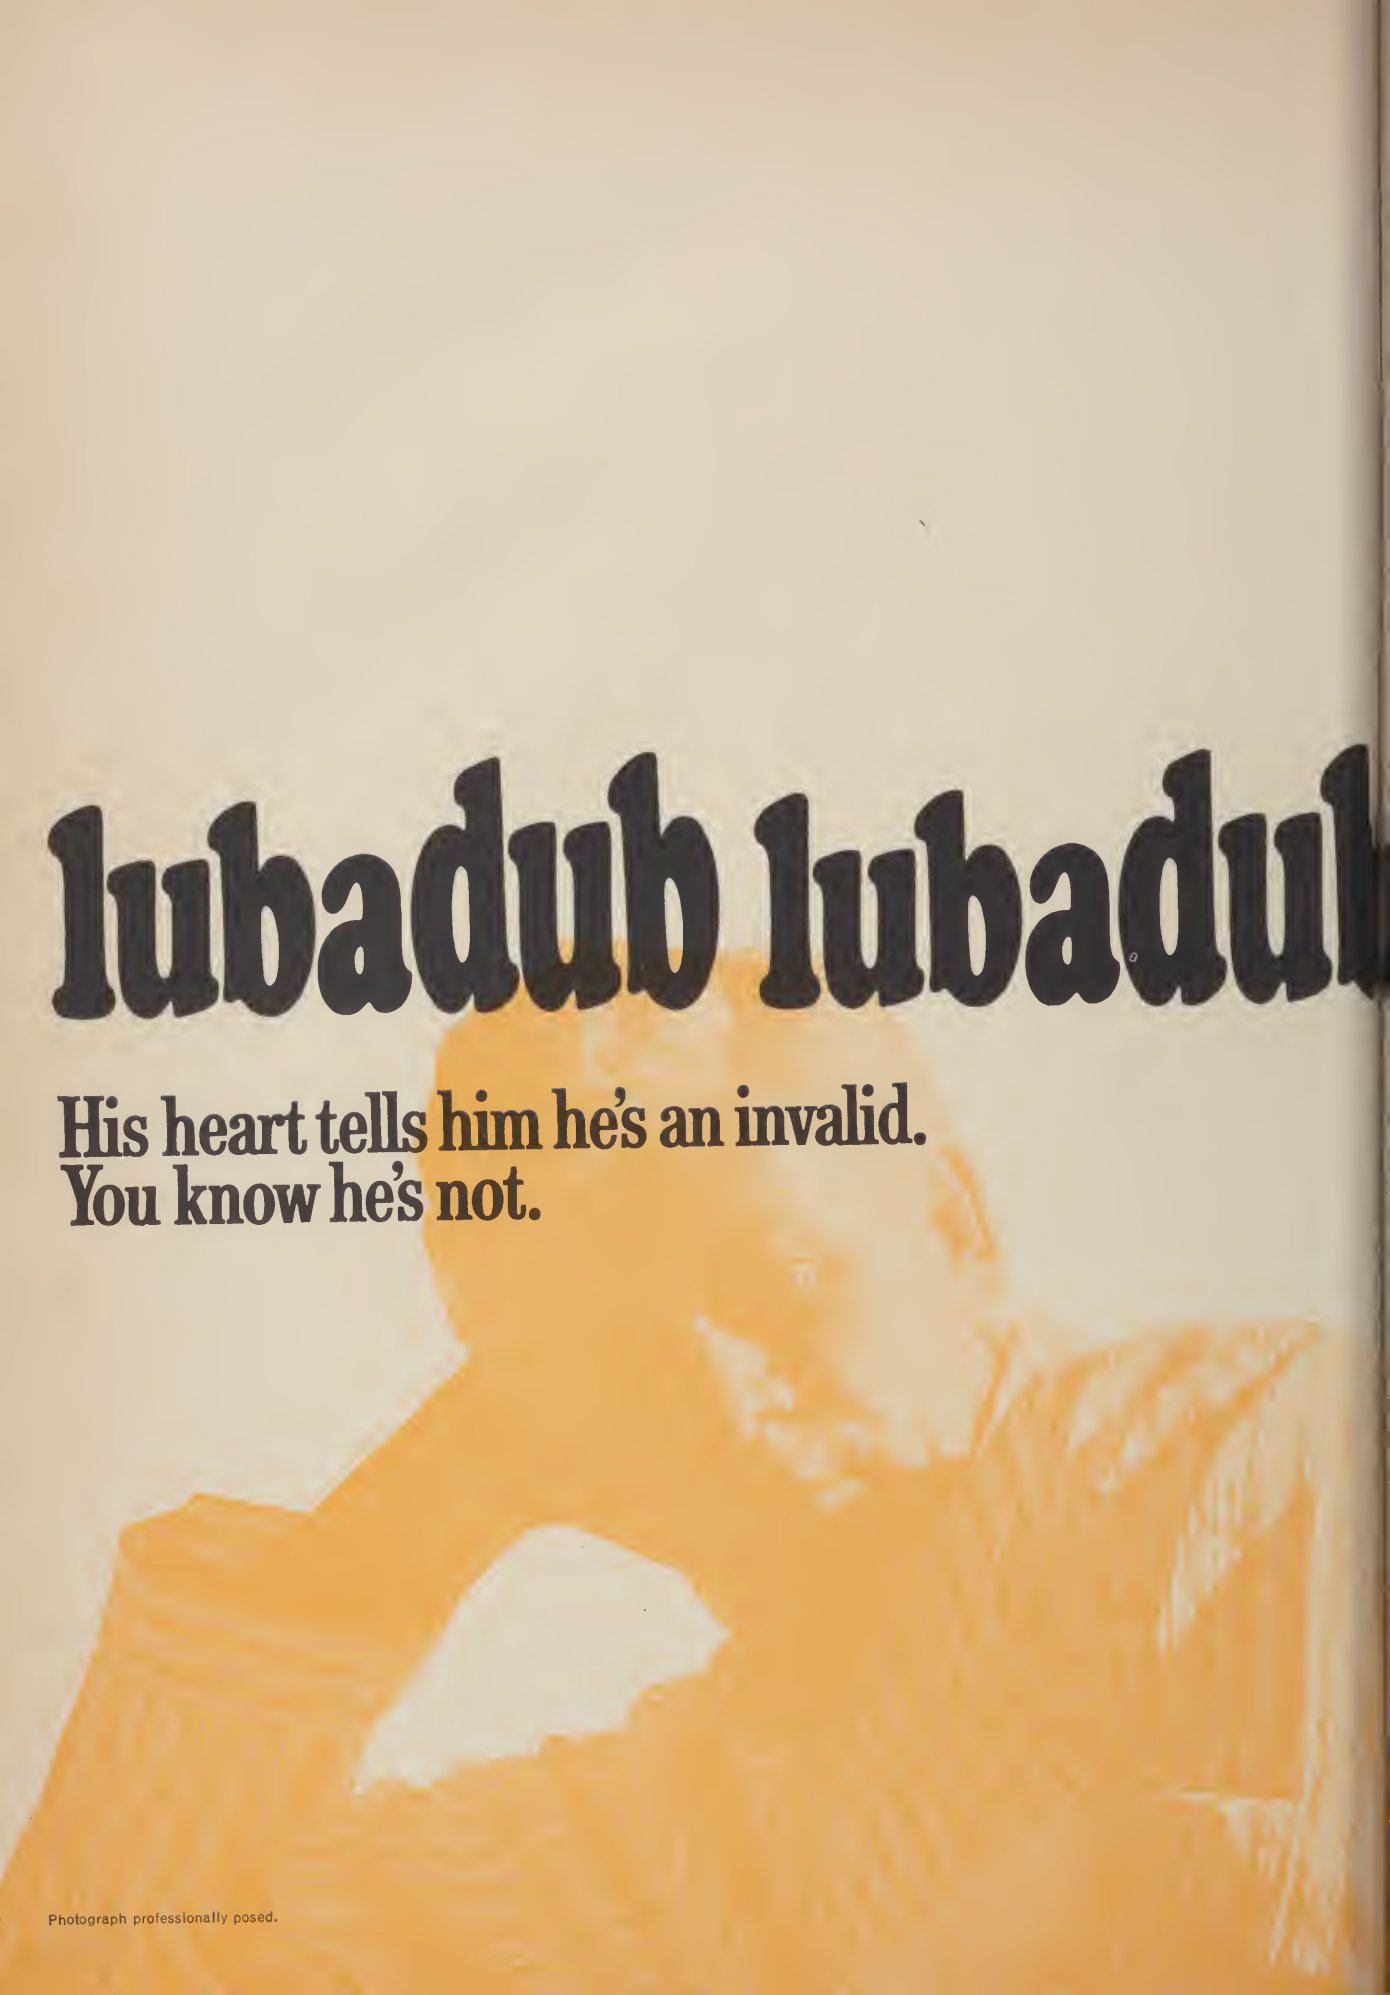
MSD | **MERCK SHARP & DOHME**
Division of Merck & Co., Inc., West Point, Pa. 1948
where today's theory is tomorrow's therap

TUSSIONEX SUSPENSION/TABLETS: Each teaspoonful (5 cc.) or tablet of TUSSIONEX contains 5 mg. hydrocodone (Warning: May be habit-forming) and 10 mg. phenyltoloxamine, both as cation exchange resin complexes of sulfonated polystyrene.

Class B narcotic — oral Rx where state laws permit.

INDICATIONS: Coughs associated with respiratory infections including chronic sinusitis, colds, influenza, bronchitis, and cough resulting from measles, pulmonary tuberculosis, bronchiectasis, and bronchogenic carcinoma.

*DOSAGE: *Adults:* 1 teaspoonful (5 cc.) or tablet every 8-12 hours. *Children:* Under 1 year: 1/4 teaspoonful every 12 hours. From 1-5 years: 1/2 teaspoonful every 12 hours. Over 5 years: 1 teaspoonful every 12 hours.



SIDE EFFECTS: May include mild constipation, nausea, facial pruritus, or drowsiness.

For complete detailed information, refer to package insert or official brochure.

Strasenburgh Laboratories Division
Wallace & Tiernan Inc., Rochester, N.Y. 14623

lubadub lubadub

His heart tells him he's an invalid.
You know he's not.

Photograph professionally posed.

Important Precautions: Carefully supervise dose and amounts prescribed, especially for patients prone to overdose themselves. Excessive prolonged use has been reported to result in dependence or habituation in susceptible persons, as alcoholics, ex-addicts, and other severe psychoneurotics. After prolonged excessive dosage, reduce dosage gradually to avoid possibly severe withdrawal reactions. Abrupt discontinuance of excessive doses has sometimes resulted in epileptiform seizures.

Warn patients of possible reduced alcohol tolerance, with resultant slowing of reaction time and impairment of judgment and coordination.

Reduce dose if drowsiness, ataxia or visual disturbance occurs; if persistent, patients should not operate vehicles or dangerous machinery.

Side Effects include drowsiness, usually transient; if persistent and associated with ataxia, usually responds to dose reduction; occasionally concomitant CNS stimulants (amphetamine, mephentermine sulfate) are desirable. Allergic or idiosyncratic reactions are rare, but such reactions, sometimes severe, can develop in patients receiving only 1 to 4 doses who have had no previous contact with meprobamate. Previous history of allergy may or may not be related to incidence of reactions. Mild reactions are characterized by itchy urticarial or erythematous maculopapular rash, generalized or confined to groin. Acute nonthrombocytopenic purpura with cutaneous petechiae, ecchymoses, peripheral edema and fever have been reported. One fatal case of bullous dermatitis following intermittent use of meprobamate with prednisolone has been reported. If allergic reaction occurs, meprobamate should be stopped and not reinstituted. Severe reactions, observed very rarely, include angioneurotic edema, bronchial spasms, fever, fainting spells, hypotensive crises (1 fatal case), anaphylaxis,

badubdub lubadu

Anxiety is expected in the cardiovascular patient. A little may even be desirable.

But when anxiety is exaggerated . . . when it interferes with sleep . . . when it aggravates cardiovascular symptoms, your help may be needed.

Naturally, you'll want to reassure the patient.

And perhaps prescribe Equanil (meprobamate) as adjunctive therapy. It helps relieve anxiety and tension specifically, yet gently.

Almost 15 years' use has shown that Equanil is usually well tolerated as well as effective. Side effects are generally limited to transient drowsiness; serious, therapy-interrupting side effects are rare.

stomatitis and proctitis (1 case) and hyperthermia. Treat symptomatically as with epinephrine, antihistamine and possibly hydrocortisone. Aplastic anemia (1 fatal case), thrombocytopenic purpura, agranulocytosis and hemolytic anemia have occurred rarely, almost always in presence of known toxic agents. A few cases of leukopenia, usually transient, have been reported on continuous administration.

Meprobamate may sometimes precipitate grand mal attacks in patients susceptible to both grand and petit mal. Extremely large doses can produce rhythmic fast activity in the cortical pattern. Impairment of accommodation and visual acuity has been reported rarely. After excessive dosage for weeks or months, withdraw gradually (1 or 2 weeks) to avoid recurrence of pretreatment symptoms (insomnia, severe anxiety, anorexia). Abrupt discontinuance of excessive doses has sometimes resulted in vomiting, ataxia, tremors, muscle twitching and epileptiform seizures. Prescribe very cautiously and in small amounts for patients with suicidal tendencies. Suicidal attempts have resulted in coma, shock, vasomotor and respiratory collapse and anuria. Excessive doses have resulted in prompt sleep; reduction of blood pressure, pulse and respiratory rates to basal levels; and occasionally hyperventilation. Treat with immediate gastric lavage and appropriate symptomatic therapy. (CNS stimulants and pressor amines as indicated.) Doses above 2400 mg./day are not recommended.

Composition: Tablets, 200 mg. and 400 mg. meprobamate. Coated Tablets, WYSEALS® EQUANIL (meprobamate) 400 mg. (All tablets also available in REDIPAK® [strip pack], Wyeth.) Continuous-Release Capsules, EQUANIL L-A (meprobamate) 400 mg.

Wyeth Laboratories Philadelphia, Pa.

Equanil®
(meprobamate) Wyeth®

No place for beginners

Terramycin®
(oxytetracycline)

An infection of rapid onset requiring prompt attention. Teenage girl with chills, fever, abdominal pain, backache and nausea. Frequent and urgent urination with burning. On examination—tenderness over kidney. Blood count and urinalysis confirm the diagnosis: acute pyelonephritis. Treatment is initiated with Terramycin. Within a few days of follow-up therapy, the patient is markedly improved. The pretreatment urine culture shows a strain of *E. coli* highly susceptible to Terramycin.

Experience has shown that Terramycin offers special advantages in treating urinary tract infections when strains of causative bacteria are susceptible. Broad-spectrum coverage unaffected by penicillinase. Effective tissue levels to help reach foci of infection in renal parenchyma. High urine levels—excreted by kidney in *active* form.

With Terramycin, you have the assurance that comes with choosing an agent physicians have depended on for over 18 years. In difficult as well as routine cases, when tests reveal susceptible organisms, consider Terramycin. One of the world's most widely used broad-spectrums.

Contraindicated: In individuals hypersensitive to oxytetracycline.

Warnings: Reduce usual oral dosage and consider antibiotic serum level determinations in patients with impaired renal function.

Use of oxytetracycline during the last trimester of pregnancy, neonatal period and early childhood may cause discoloration of developing teeth. This effect occurs mostly during long-term use of the drug, but it has also been observed in usual short-treatment courses.

During treatment with tetracyclines, individuals susceptible to photodynamic reactions should avoid direct sunlight; if such reactions occur, discontinue therapy.

Note: With oxytetracycline, phototoxicity is unknown and photoallergy very rare.

Precautions: Use of broad-spectrum antibiotics occasionally may result in overgrowth of nonsusceptible organisms. Where such infections occur, discontinue oxytetracycline and institute specific therapy. Increased intracranial pressure in infants is a possibility. Symptoms disappear upon discontinuation of therapy.

Adverse Reactions: Nausea, diarrhea, glossitis, stomatitis, proctitis, vaginitis and dermatitis, as well as reactions of an allergic nature, may occur but are rare.

Supply:* Terramycin Capsules: oxytetracycline HCl, 250 mg. and 125 mg. Terramycin Syrup: calcium oxytetracycline, 125 mg. per 5 cc. Terramycin Pediatric Drops: calcium oxytetracycline, 100 mg. per cc.

*All potencies listed are in terms of the standard, oxytetracycline.

More detailed professional information available on request.

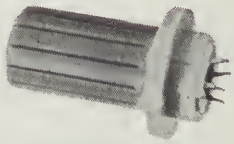
Book Reviews



YOUR COMMUNITY HOSPITAL, Robert E. Walsh; Beacon Press, Boston, 1969.

This book concerns the quality of hospital care a patient is likely to receive. It is directed toward the American citizen in his community in order to explain the functions and services a hospital is supposed to perform. In his attempt to make the public more aware, the author poses the question: What can a private citizen do to help the hospital improve its health care programs?

> ". . . If health care of a high quality is a right, there certainly must be a corollary which puts a responsibility on the citizen to know and understand what is available and how to use it most effectively. It would appear to be true that the voluntary health organizations, the political and civic groups, and the labor movement, which have insisted

TB is still around.

In 1967 almost 45,000 new active cases were reported. Isn't that a good reason to make tuberculin testing with the white LEDERTINE™ Applicator a routine part of your physical examinations?

TUBERCULIN TINE TEST
(Rosenthal) with Old Tuberculin

Precautions: With a positive reaction, consider further diagnostic procedures. Use with caution in persons with active tuberculosis or known allergy to acacia. Vesiculation, ulceration, or necrosis may occur at the test site in highly sensitive persons.

Lederle LEDERLE LABORATORIES
A Division of American Cyanamid Company, Pearl River, N.Y.

that health care is a basic right, now have some responsibility to see that this right is not abused and also to see that communities use these health services in the most efficient manner."

Another interesting point which Mr. Walsh makes involves rising hospital costs. He suggests that labor stop criticizing hospitals for the rising cost of patient care, since labor itself is one of the reasons for this escalation.

In conclusion, the book is informative and well worth your reading. However, it is doubtful those persons who would benefit the most from reading the book will exert themselves enough to pick it up.

TEXTBOOK OF PEDIATRICS, Waldo E. Nelson, MD; The W. B. Saunders Company, Philadelphia, 1969.

The great increase in medical knowledge and the potentials for application of it to the medical care of children have necessitated the sharing of the responsibility of publication of this book with other medical writers. This book continues to provide, in a single volume, the synthesis of pediatric knowledge which will be appropriate for the student as an introduction to pediatrics and for the clinician as a useful and competent reference.

Dear Doctor, You made me what I am today— a whole lot slimmer!

TEPANIL—the right start in support of the weight-control program *you* recommend. It reduces the appetite. Doesn't kill it. Weight loss is significant—gradual—yet there is a relatively low incidence of CNS stimulation. Because TEPANIL works on the appetite, not on the "nerves."

Contraindications: Concurrently with MAO inhibitors, in potients hypersensitive to this drug; in emotionally unstoble patients susceptible to drug obuse.

Warning: Although generally sofer thon the omphetomines, use with greot coution in patients with severe hypertension or severe cardiovoscular diseose. Do not use during first trimester of pregnoncy unless potential benefits outweigh potentiol risks.

Adverse Reactions: Rarely severe enough to require discontinuotion of therapy, unpleasant symptoms with diethylpropion hydrochloride have been reported to occur in relatively low incidence.

As is choracteristic of sympothomimetic ogents, it may occasionally couse *CNS effects* such as insomnio, nervousness, dizziness, onxiety, and jitteriness. In controst, CNS depression hos been reported. In o few epileptics an increose in convulsive episodes hos been reported.

Sympothomimetic *cordiovosculor effects* reported include ones such os tochycordia, precordial poin, orrhythmio, polpitotion, and increosed blood pressure. One published report described T-wove changes in the ECG of o healthy young male after ingestion of diethylpropion hydrochloride; this wos on isoloted experience, which has not been reported by others.

Allergic phenomeno reported include such conditions os rosh, urticorio, ecchymosis, ond erythema. *Gostrointestinol effects* such os diorrheo, constipotion, nouseo, vomiting, ond obdominal discomfort have been reported.

Specific reports on the hemotopoietic system include two each of bone morrow depression, ogronulocytosis, and leukopenio.

A voriety of miscellaneous adverse reoctions have been reported by physicions. These include complaints such os dry mouth, heodoche, dyspnea, menstruol upset, hoir loss, muscle pain, decreosed libido, dysuria, ond polyuria.

Convenience of two dosage forms: TEPANIL Ten-tab tablets: One 75 mg. tablet daily, swallowed whole, in midmorning (10 o.m.); TEPANIL: One 25 mg. tablet three times daily, one hour before meals. If desired, an additionol toblet moy be given in midevening to overcome night hunger. Use in children under 12 years of oge is not recommended.

Tepanil® Ten-tab®

(cantinuous release form)

(diethylpropion hydrochloride)

PHILADELPHIA, PENNSYLVANIA 19144 T-918A U.S. PATENT NO. 3,001,910 5/69

172nd ANNUAL MEETING

Medical and Chirurgical Faculty of the State of Maryland

APRIL 1, 2, 3, 1970

Scheduled for the 1970 Annual Meeting are many prominent speakers, such as

John Rock, MD, Boston

George James, MD, Dean of Mount Sinai School of Medicine, New York

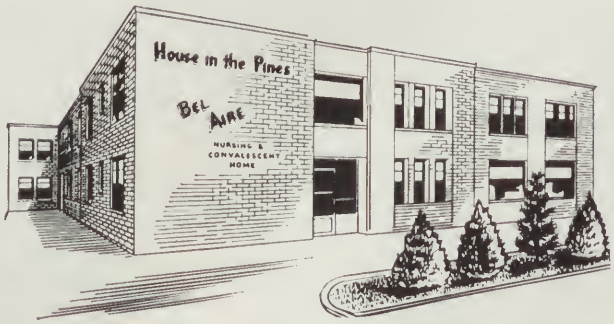
Dan M. Gordon, MD, New York

Felix Wroblewski, MD, Brookdale Hospital Center, New York

Roy W. Menninger, MD, President of The Menninger Foundation, Topeka, Kansas.

Medical and Surgical Grand Rounds will be presented by the Department of Medicine of The Johns Hopkins and the Department of Surgery of the University of Maryland.

Other activities scheduled are



Annual Round-Table Luncheon, which will include luncheon meetings of the alumni associations of several medical schools

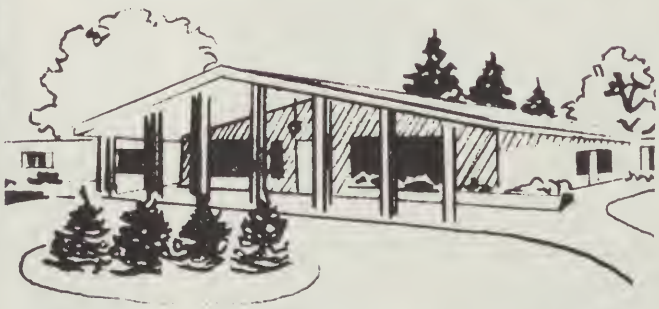
Hospitality Night—this proved so very popular at the 1969 Meeting, that it will be repeated in 1970

Annual Presidential Reception and Banquet—at the Blue Crest North, well known for its delectable cuisine, hors d'oeuvres, and cocktails—in a delightful atmosphere

When Professional Experience Counts

The House In The Pines Staff Is Able and Ready To Serve!

BEL AIRE . . . 5837 Belair Road • CL 4-8800



BELVEDERE . . . 2525 W. Belvedere Ave. • FO 7-9100

Conveniently located 1 block from Sinai Hospital.

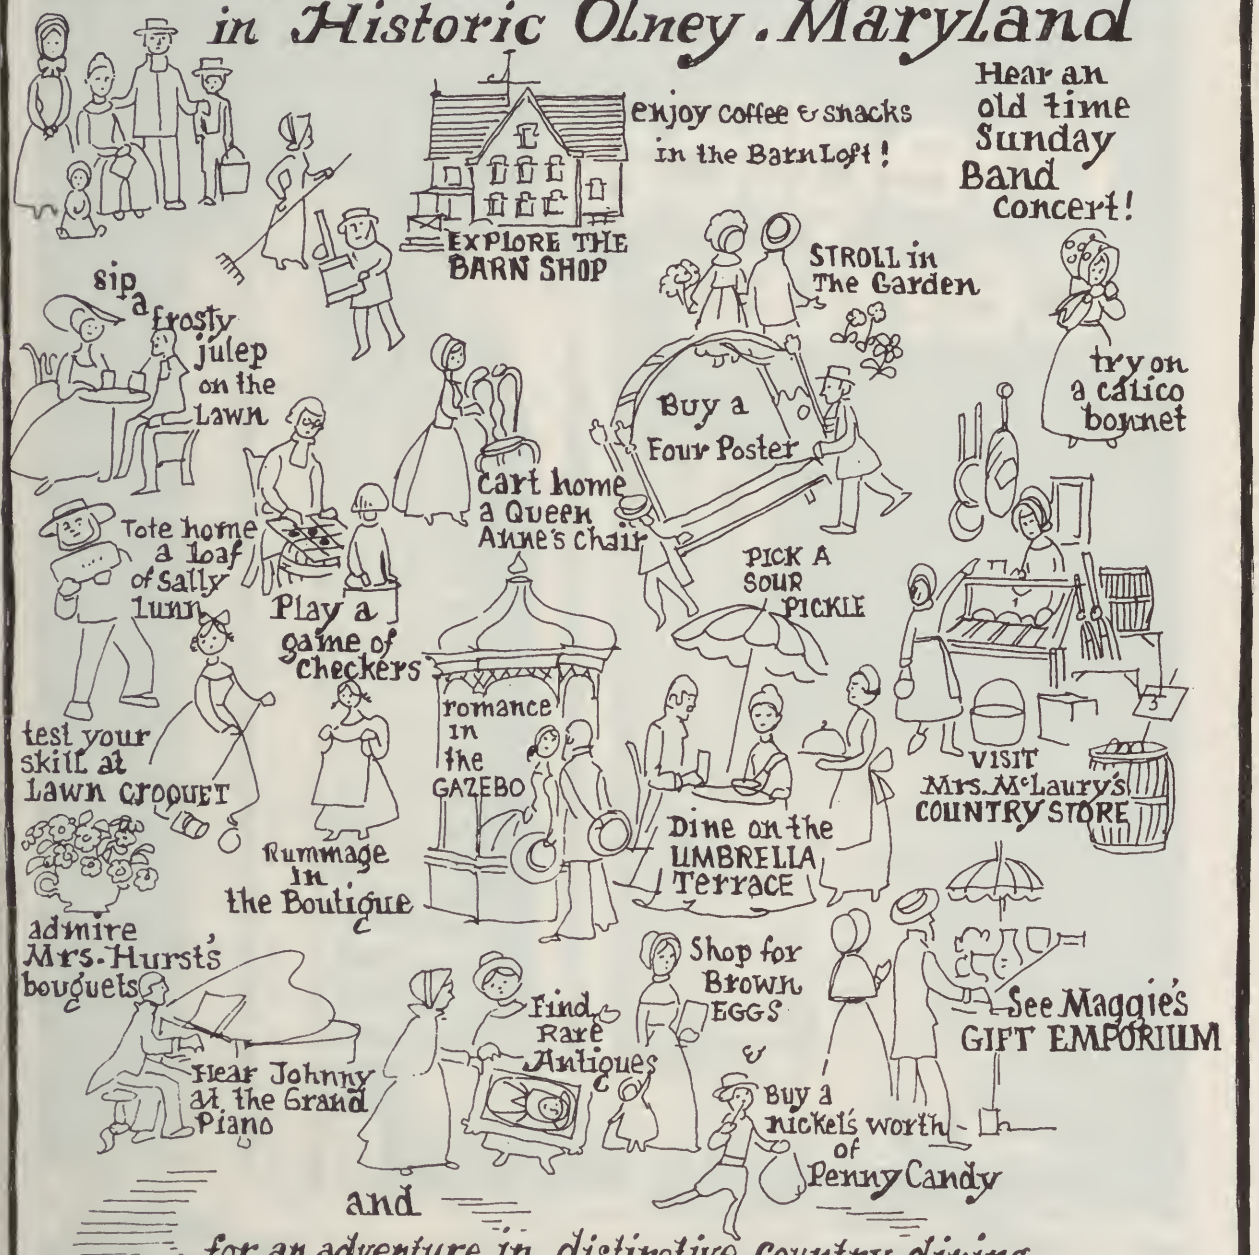
CATONSVILLE . . . 16 Fusting Avenue • RI 7-1800

EASTON, Md. . . . Rt. 50 & Dutchman's Lane • TA 2-4000

HOUSE IN THE PINES Nursing and Convalescent Homes offer efficient, round the clock care under the direct supervision of registered nurses, 24 hours a day.

The aged, convalescent and the chronically ill guests enjoy a modern, home-like atmosphere with the most up-to-date medical and therapy equipment at their side.

Complete physical and occupational therapy programs are available. The recreational programs are designed to full-fill the needs and desires of our guests.



Excellent food is served, and special diets catered to, under the direct supervision of our licensed staff dietician.

Physicians orders are followed explicity!

OF POSTGRADUATE PROGRAMS

presented through

Medical Education's Dedicated Instructional Channel

Supported in part by a grant from Merck Sharp and Dohme

OCTOBER 24, 1969 — 12:30 PM

INFECTIOUS MONONUCLEOSIS

Dexter Seto, MD
Assistant Professor of Pediatrics
The Johns Hopkins University School of Medicine

This discussion will cover several clinical aspects of infectious mononucleosis, the various manifestations and complications, and laboratory aids in diagnosis. Current concepts in etiology will also be considered.

ALCOHOLISM

Roland Smoot, MD
Chief of Medicine
Provident Hospital

Maxwell N. Weisman, MD
Director, Division of Alcoholism Control
State Department of Mental Hygiene

The speakers will discuss the specific role of the general hospital in coping with the acute phase of alcoholism, but will also consider the responsibility of other community agencies which may serve as allies to the physician in managing the chronic illness within the framework of a comprehensive public health program.

OVARIAN DYSFUNCTION

Georgeanna Seegar Jones, MD
Associate Professor of Obstetrics and Gynecology
The Johns Hopkins University School of Medicine

Ovarian dysfunction can be clinically characterized by irregular or absent periods or prolonged or profuse menses. The decision as to whether or not the symptoms require investigation or treatment must be made on the basis of the individual case. When primary amenorrhea exists, it is always important to determine if an associated abnormality of the genitalia exists. No intelligent approach can be made to therapy of ovarian dysfunction until a proper etiologic diagnosis has been obtained. With the addition of human pituitary gonadotrophin and clomiphene citrate to our therapeutic armamentarium, the results of therapy are more encouraging.

PROBLEMS OF POLYARTHRITIS

Mary Betty Stevens, MD
Assistant Professor of Medicine
The Johns Hopkins University School of Medicine

Patients with acute polyarthritis, of recent onset, present difficult problems in diagnosis and management. The approach to differential diagnosis, clinical and laboratory study, will be discussed. Therapeutic regimens and philosophy of management will be outlined. Individual cases of illustrative value will be presented.

OBESITY

Simeon Margolis, MD
Assistant Professor of Medicine
The Johns Hopkins University School of Medicine
University of Maryland School of Medicine

An increasing number of patients are turning to physicians for assistance in weight reduction and for treatment of the complications of obesity. Management of the obese patient is an extremely frustrating medical problem, but may involve dietary, drug, and psychiatric measures. This talk will cover the pathogenesis, complications, and management of obesity.

MEDICAL NEWS

On August 31, 1969, **Jacob H. Conn, MD,** Assistant Professor of Psychiatry at The Johns Hopkins University School of Medicine, discussed his method of Hypnosynthesis at the organizational meeting of the first Hypnosis Section to be established by the American Psychological Association at its annual meeting in Washington, D. C.

Dr. Conn was the first practicing psychiatrist to be certified in Maryland by the American Board of Psychiatry and Neurology in 1935 and first to be certified in Child Psychiatry in 1959. In 1968, he received the award for the best paper on clinical hypnosis. Dr. Conn is past president of the American Board of Medical Hypnosis and of the National Society for Clinical and Experimental Hypnosis.

The American Association of Blood Banks in Chicago and **The American National Red Cross** in Washington, D. C. announced recently that Americans in good health can now be blood donors until their 66th birthday instead of the 60th or 61st as in the past. According to Frank Coleman, MD, of Tampa, Florida, the standards for blood donation were liberalized because Americans are living longer due to better medical care and better nutrition, and the need for blood is constantly increasing at a rate of about 12% annually.

* * *

David Rogers, MD, Dean of The Johns Hopkins School of Medicine, will be guest speaker before **the Professional Forum** at this group's monthly dinner-seminar at the Baltimore Country Club on Tuesday evening, November 18th. Dean Rogers will speak on "The Problems of Patient Care Today." A question and answer session will follow the discussion.

Established in early 1965, the Professional Forum consists of local physicians, dentists, certified public accountants, educators, clergymen, judges, lawyers, criminologists and behavioral scientists, each group represented by its own committee.

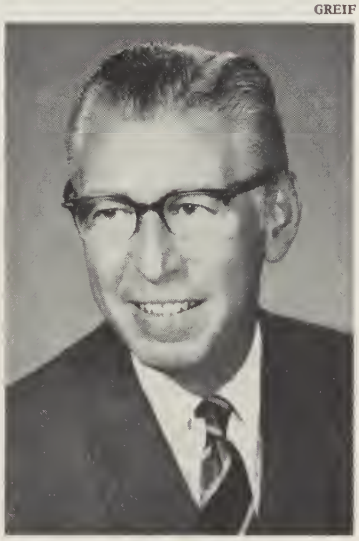
In addition to maintaining a close liaison with county, state, and national professional associations, the Professional Forum provides educational programs, workshops, and guest speakers to business, civic, professional, and college audiences.

* * *

The U. S. Agency for International Development has requested that the AMA continue its administration of the program for an additional two years. Four hundred additional volunteers are needed to maintain 32 physicians in Viet Nam until June 1971. The greatest need is for general practitioners, general surgeons, internists, orthopedic surgeons, pediatricians, and preventive medicine specialists.

Interested physicians should contact the Director, Volunteer Physicians for Viet Nam Program, American Medical Association, 535 North Dearborn, Chicago, Illinois 60610.

* * *



J. H. Mason Knox, 3d, MD, has been elected chief of the medical staff and chairman of the medical board of Church Home and Hospital. He succeeds James C. Owings, MD. Dr. Knox was graduated from The Johns Hopkins Medical School in 1938, after receiving his undergraduate degree from Yale.

A general surgeon, Dr. Knox interned at Union Memorial and completed his residency at the Church Home and Hospital. During World War II, Dr. Knox served with the 4th Auxiliary Surgical Group of the 3rd Army. As a captain, he headed a surgical team, and earned the Bronze Star.

The California Medical Association recently published a new edition of the *Relative Value Studies* in September, which will

become effective for usage in California on April 1, 1970. This book contains a complete listing of procedures performed by physicians and unit values which indicate the relationship of values of services to each other. It is designed to assist physicians, health insurance carriers, consumers, and business to identify procedures which physicians perform.

Copies of the revised edition of *Relative Value Studies* may be obtained by writing to: Six-Ninety-Three Sutter Publications, Inc., 693 Sutter Street, San Francisco, Calif. 94102.

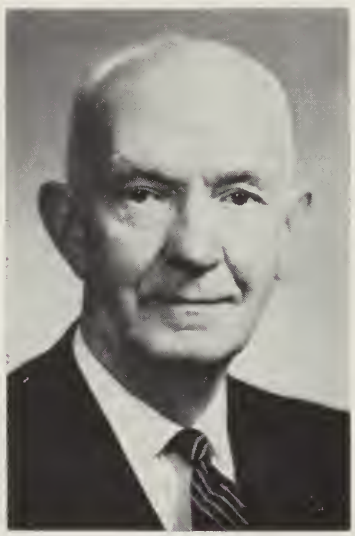
* * *

The National Institute of Mental Health's Center for Studies of Crime and Delinquency sponsored a two-day conference in Chevy Chase, Maryland, on June 19 and 20, 1969. Members of the conference, including experts in the fields of genetics, psychiatry, psychology, sociology, and law discussed a possible link between the XYY syndrome and criminal behavior.

Chaired by **Park Gerald, MD,** of Boston's Children's Hospital, members of the conference concluded that although the general impression has been conveyed that the presence of the XYY chromosome is clearly related to criminal behavior, there is no definite evidence of a connection between the two at the present time.

Guidelines were also developed at the conference for further research and study of the subject.

* * *



Horace L. Hodes, MD, chairman of the department of pediatrics at Mount Sinai Hospital in New York, has been named as the first Herbert H. Lehman Professor of Pediatrics at the hospital's new school of medicine. The pediatrics chair has been endowed by Mrs. Herbert H. Lehman in memory of her husband.

Dr. Hodes has been the director of pediatrics at the Mount Sinai Hospital since 1949, and will continue in that position while he also heads the school's department.

He is recognized as one of the country's leading authorities on viral and infectious diseases, and for his contributions to the development of techniques for treating children's diseases. Among the notable achievements of Dr. Hodes and his colleagues have been the discovery of the major role of action of vitamin D and the development of a rabies vaccine which was the first completely noninfectious, but immunologically active antiviral vaccine.

After graduating from the University of Pennsylvania College of Medicine and before coming to the Mount Sinai Hospital, Dr. Hodes was associated with The Johns Hopkins Hospital and Medical School in Baltimore, and was director of Sydenham Hospital, Baltimore.

* * *

Dr. Walsh

Frank Burton Walsh, MD, Professor Emeritus in Ophthalmology, Wilmer Institute, Johns Hopkins Hospital, was chosen by the Pennsylvania Academy of Ophthalmology and Otolaryngology to be guest of honor at its annual convention held in Bedford, Pennsylvania, on May 24, 1969. Dr. Walsh was presented with a plaque commemorating the occasion in appreciation of his contribution to the medical profession in the field of neuro-ophthalmology. He has taught at the Wilmer Institute as professor of ophthalmology since 1958 and has been professor emeritus since 1962.

Dr. Walsh attended Queen's University in Canada and received his MD from the University of Manitoba. He has received honorary doctor of science degrees from the University of Western Australia and from the University of Manitoba. Queen's University has awarded him an LLD, an honorary doctor of laws degree.

* * *

Malcolm L. Peterson, MD, PhD, of the Washington University School of Medicine in St. Louis, has been named director of the new Health Services Research and Development Center at The Johns Hopkins Medical Institutions, effective July 1.

The appointment was announced in May, 1969, by Russell A. Nelson, MD, president of The Johns Hopkins Hospital; David E. Rogers, MD, dean of the School of Medicine; and John C. Hume, MD, dean of the School of Hygiene and Public Health.

Dr. Peterson has also been appointed associate professor both in the department of medicine of the School of Medicine, and in the School of Hygiene and Public Health.

Dr. Peterson received his bachelor's degree from Stanford University in 1950, and his medical degree with honors from the University of Washington, Seattle, in 1954. He also holds a PhD in biochemistry, awarded by the Rockefeller Institute in 1960.

* * *

Dwight L. Wilbur, MD, immediate Past-President of the AMA, has stressed the vital importance of increasing the efficiency and economy of the rapidly growing Medicaid program. According to Dr. Wilbur, "In 1968 it cost $3,500,000,000 and served 8,500,000 people. It is likely that in fiscal 1970 it will cost $4,862,000,000 and serve 10,200,000 people. And estimates of costs, if the present law is in effect in 1975, range from $12 to $16 billion."

Dr. Wilbur and his associates are hoping for an improved Medicaid program that will be more efficient and better managed. Significant cooperation is also being received from the states, hospitals, allied professions, and physicians. Presently, medical care to the poor, on a welfare basis, is being abandoned for new programs that will enable needy people to receive the same quality of medical care from hospitals and private physicians as do more affluent citizens.

* * *

Leo Kanner, MD, FAAP, Professor Emeritus of Child Psychiatry, The Johns Hopkins University School of Medicine, has been named by the American Academy of Pediatrics to receive its 1969 C. Anderson Aldrich Award for outstanding contributions in the field of child development.

Significant aspects of Dr. Kanner's career include the identification of a disorder he termed "early infantile autism" which has become widely known as Kanner's Syndrome. His analysis of this disorder and its psychological and pathological features have greatly contributed to the study of psychosis in early childhood. Dr. Kanner's outstanding contributions to child psychiatry as a Commonwealth Fund Fellow, from 1928-1930 at Johns Hopkins, led to his selection as the first director of the first division of psychiatry within a department of pediatrics. Hopkins established the division in 1930, and Dr. Kanner served as director for 29 years.

Dr. Kanner received his MD degree from the University of Berlin in 1921.

NMA LEADERS MEET WITH PRESIDENT NIXON

President Nixon expresses his gratitude to Emerson C. Walden, MD, of Baltimore and Columbia, Chairman of the Board of Trustees of the National Medical Association, and other leaders of the organization who took time out from their 74th Annual Convention in San Francisco to confer with him at the West Coast White House. With the President and Dr. Walden are (from left): James M. Whittico, Jr., MD, of St. Louis, out-going President of NMA; Julius W. Hill, MD, Los Angeles, incoming President, and John L. Wilks, Deputy Assistant Secretary of Labor for Compliance and Director of the Labor Department's Office of Federal Contract Compliance.

Emerson C. Walden, MD, of Baltimore, Chairman of the National Medical Association Board of Trustees, was among the Negro delegation who met with President Nixon in August to discuss the present welfare system. Accompanying Dr. Walden were **James M. Whittico, MD,** of St. Louis, outgoing president, and **Julius Hill, MD,** of Los Angeles, incoming president of NMA.

The NMA leaders, attending the 74th Annual Convention and Scientific Assembly in San Francisco, told the President they were pleased with his proposal to overhaul the present system, and were impressed with his awareness of the shortage of Negro physicians. Dr. Hall described the meeting as "quite fruitful."

SCIENTIFIC EXHIBITS

The scientific exhibits are an integral part of the Annual Meeting of the Medical and Chirurgical Faculty. All physicians who have a scientific exhibit are urged to fill in the application below for the next Annual Meeting, which will be held

APRIL 1, 2, 3, 1970

The Alcazar, Baltimore

As space is limited, it is suggested that applications be submitted as soon as possible.

RULES GOVERNING SCIENTIFIC EXHIBITS

The following rules govern the selection and conduct of scientific exhibits:

1. Each exhibitor shall be fully responsible for the content, arrangement, presentation, setting up, and dismantling of his exhibit.
2. Cost of transportation of exhibit to and from the meeting must be borne by the exhibitor.
3. The Medical and Chirurgical Faculty will provide, without cost to the exhibitor, a backdrop and side rails for the booth, and 1000 watt electric current outlets.
4. MOTION AND SOUND MAY BE USED ONLY IF THEY DO NOT DETRACT FROM OTHER EXHIBITS, DISTURB THOSE IN ROOM, OR INTERFERE WITH TELEPHONES.
5. No reference to, or credit for, financial aid shall be shown on the exhibit.
6. Only generic names may be used, and shall not exceed one inch in height. NO TRADE NAMES are permissible.
7. Each exhibit should be manned at all times by someone thoroughly familiar with its content.
8. Exhibitors are urged to discuss their displays and work with the physicians and students.
9. The Medical and Chirurgical Faculty reserves the right to approve or reject any exhibit without recourse.

APPLICATION FOR SCIENTIFIC EXHIBIT SPACE

Fill in and mail to: Chairman, Exhibit Subcommittee
Medical and Chirurgical Faculty
1211 Cathedral Street, Baltimore, Md. 21201

1. Title of exhibit: _____

_____

2. Please attach a 50-100 word description of the exhibit: _____

3. Give amount of space required, depth, width, and height: _____

If exhibit has side panels, are depth and width included above? _____

If not, what additional space is required? _____

4. Electrical or other requirements: _____

_____

5. Has exhibit been shown at other medical meetings? _____

_____

6. Name and title of exhibitor: _____

_____

7. Name of institution cooperating in the exhibit: _____

_____

8. Address of exhibitor: _____

SYMPOSIUM ON VIRAL DISEASES

Osler Hall, 1211 Cathedral Street, Baltimore

Cosponsored by the Medical and Chirurgical Faculty of Maryland and the National Communicable Disease Center

9:30 AM Welcome and Introductions ..... **John Whitridge, Jr., MD**
Chairman, Committee on Postgraduate Education, Preventive Medicine, and Public Health, Medical and Chirurgical Faculty.

9:35 AM Introductory Remarks ..... **Richard B. Hornick, MD**
Moderator
Associate Professor of Medicine and Director, Division of Infectious Diseases, University of Maryland School of Medicine

9:40 AM Advances and Horizons in Virology ..... **Maurice A. Mufson, MD**
Director of Virology, Hektoen Institute for Medical Research of Cook County Hospital, Chicago

Dr. Mufson

Dr. Brunell

10:20 AM Viral Exanthems and Rubella ..... **Philip A. Brunell, MD**
Assistant Professor of Pediatrics, New York University School of Medicine

11:00 AM Coffee break

11:20 AM Hepatitis ..... **Friedrich W. Deinhardt, MD**
Chairman, Department of Microbiology, Presbyterian–St. Luke's Hospital, Chicago

12:00 NOON Question and Answer Period

12:30 PM Lunch

Dr. Deinhardt

1:25 PM Introductory Remarks ..... **Neal Nathanson, MD**
Moderator
Professor of Epidemiology, The Johns Hopkins University School of Hygiene and Public Health

1:30 PM Respiratory Viral Diseases ..... **H. Brandis Marsh, MD**
Medical Officer, Respiratory Virology Unit, Laboratory Division, National Communicable Disease Center

Dr. Marsh

2:10 PM CNS-Enteric Viruses ..... **Richard T. Johnson, MD**
Eisenhower Professor of Neurology, Associate Professor of Microbiology and Director of Neurovirology Laboratories, The Johns Hopkins University School of Medicine

2:50 PM Intermission

3:00 PM Laboratory Diagnosis of Viral Diseases ..... **J. Mehsen Joseph, PhD**
Chief, Division of Virology, Bureau of Laboratories, Maryland State Department of Health

3:40 PM Antiviral Agents ..... **Robert M. Friedman, MD**
Senior Investigator, Laboratory of Pathology, National Cancer Institute

Dr. Friedman

4:20 PM Question and Answer Period

5:00 PM Adjourn

Note: Each 30-minute presentation will be concluded by a 10-minute question and answer period.

* House officers and medical students, $2.50 (please indicate)

Let's be specific about Campbell's Soups... and *reducing diets*

There are more than 30 million people in America who are overweight. During the next year, you probably will see more than 1,000 of them in your own practice.

One good way to help these patients is to give them a reducing diet based on ordinary eating patterns.

Campbell has prepared a sensible plan for weight control based on ordinary eating patterns. The plan consists of a patient instruction booklet and a set of menus which provide approximately 1,400 calories daily. The menus are balanced to provide the minimum daily requirements of nutrients.

To obtain a supply for your office write to:
Campbell Soup Company, Box 265, Camden, N. J. 08101

Pro-Banthine® Helps...

propantheline bromide

...REVEAL the ulcer

...HEAL the ulcer

The efficiency of Pro-Banthine—its favorable balance of therapeutic and secondary actions—has been thoroughly tested and observed. This quality has been demonstrated surgically, roentgenographically, cinegastroscopically and, above all, clinically.

When physicians needed to relax the restless duodenum for the recently refined technic of hypotonic duodenography they logically turned to Pro-Banthine.

For years Pro-Banthine has been the most widely used anticholinergic medication for calming the gastrointestinal tract—for suppressing secretion, prolonging the action of antacids and providing the proper environment for healing peptic ulcers.

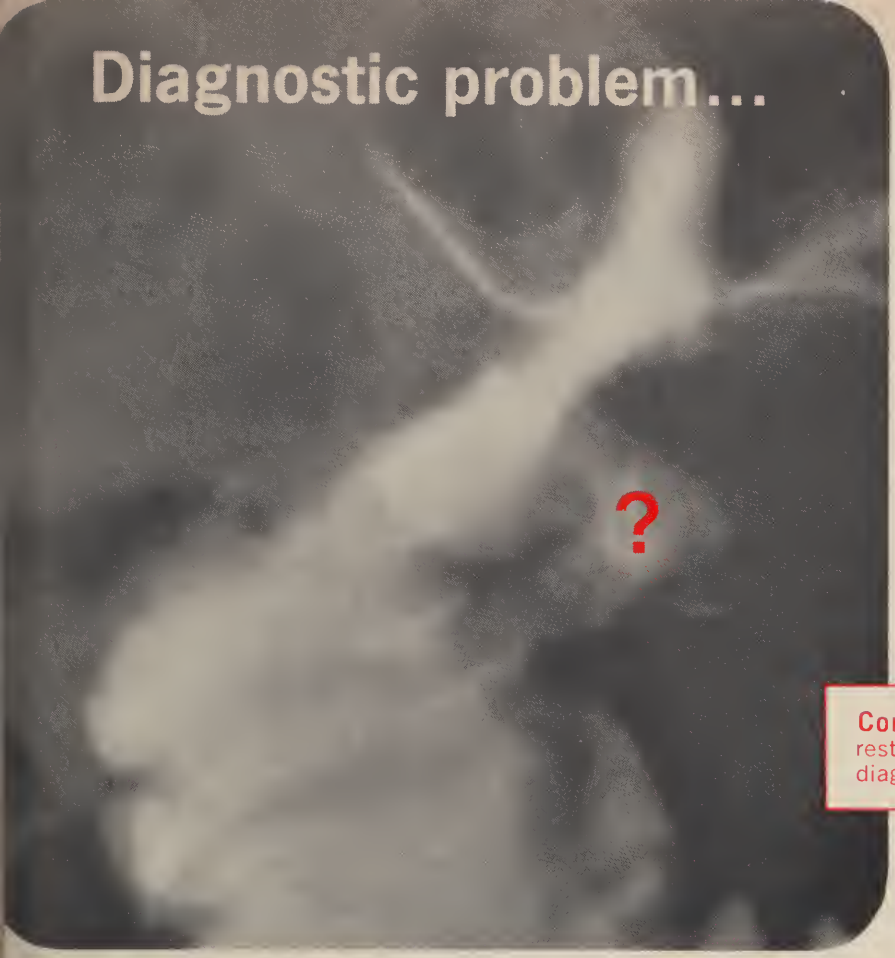
These established therapeutic actions make Pro-Banthine particularly useful in:

- peptic ulcer
- gastritis
- diverticulitis
- irritable colon
- biliary dyskinesia
- functional hypermotility

We wish to thank Drs. Marcia K. Bilbao, Louis H. Frische, Josef Rösch and Charles T. Dotter for this exceptionally graphic example of hypotonic duodenography.

Contraindications: Glaucoma, severe cardiac disease.

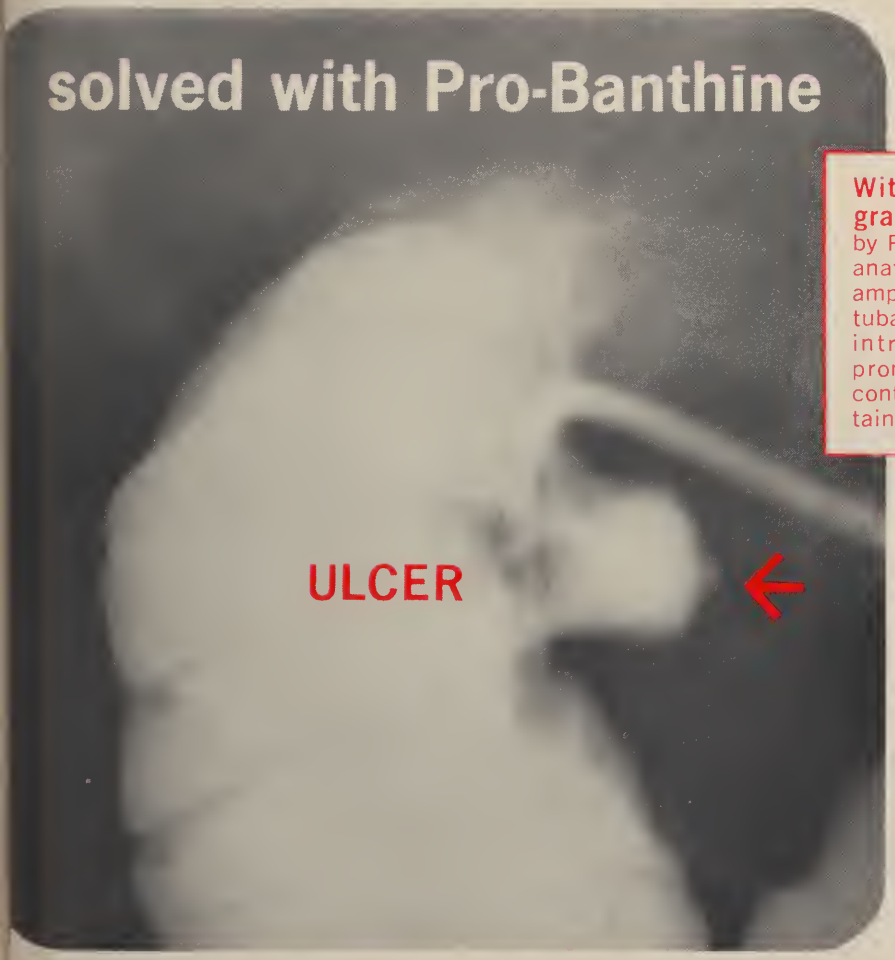
Precautions: Since varying degrees of urinary hesitancy may occur in elderly men with prostatic hypertrophy, this should be watched for in such patients until they have gained some experience with the drug. Although never reported, theoretically a curare-like action may occur with possible loss of voluntary muscle control. Such patients should receive prompt and continuing artificial respiration until the drug effect has been exhausted.



Side Effects: The more common side effects, in order of incidence, are xerostomia, mydriasis, hesitancy of urination and gastric fullness.

Dosage: The maximal dosage tolerated without excessive side effects is usually the most effective. For most adult patients this will be four to six 15-mg. tablets daily in divided doses. In severe conditions as many as two 15-mg. tablets four to six times daily may be required. Pro-Banthine (brand of propantheline bromide) is supplied as tablets of 15 mg., as prolonged-acting tablets of 30 mg. and, for parenteral use, as serum-type vials of 30 mg. The parenteral dose should be adjusted to the patient's requirement and may be up to 30 mg. or more every six hours, intramuscularly or intravenously.

98



SEARLE *Research in the Service of Medicine*

Diagnostic problem...

Conventional x-rays of the restless duodenum are often diagnostically indefinite.

solved with Pro-Banthine

With hypotonic duodenography duodenal calm induced by Pro-Banthine permits clear anatomic appraisal. In this example the duodenum was intubated. Pro-Banthine, 60 mg. intramuscularly, produced prompt aperistalsis. Double contrast visualization was obtained with barium and air.

What's Polycillin® (ampicillin trihydrate) got to do with the price of bananas?

Just this: According to the U.S. Bureau of Labor Statistics, bananas are one of the few things that actually cost less today than five years ago. The same is true of Polycillin. In fact, the price of Polycillin has been reduced about 30% since its introduction in 1963...making it, according to national surveys of patient costs, as economical as leading brands of tetracycline and erythromycin.

And Polycillin is available in a variety of dosage forms for your patients—more than any other ampicillin. It comes in 250 mg. and 500 mg. capsules; in convenient, chewable tablets of 125 mg; oral suspension, 125 mg. and 250 mg. per 5 ml.; and in pediatric drops, 100 mg. per ml. Also available parenterally as Polycillin-N (sodium ampicillin).

Highway Deaths, Natural and Traumatic

SUSAN P. BAKER, MPH
Department of Public Health Administration
Johns Hopkins School of Hygiene and Public Health

At the Third Triennial Congress of the International Association for Accident and Traffic Medicine, **Jorgen Voigt,** from the University Institute of Forensic Medicine in Denmark, reported a study of road traffic deaths from natural causes. The 189 cases, which occurred over a 13-year period, included 83 automobile drivers in addition to bicyclists and motorcyclists.

Most of the deaths were attributed to coronary sclerosis and other cardiac disorders. Although 57% of the automobile drivers died before they had time to react, no other persons were killed or seriously injured; only two received slight injuries. The author concluded that "drivers in recognized or unrecognized danger of dying suddenly do not present any serious hazard to road safety."

Donald C. Pelz and **Stanley H. Schuman,** of the Highway Safety Research Institute at the University of Michigan, studied over 700 young male drivers in an effort to understand their high accident and violation rates. They found that accidents and violations increased from age 16 to age 20, then declined. Admission of risk-taking activity, such as running yellow lights and exceeding the speed limit, roughly paralleled the age-associated rise and fall in accident rate. Teen-agers were reluctant to drive after drinking, but the practice increased steadily up to age 22 and remained high at least through age 44. The accident rate per mile was highest in the young drivers who were driving the least, suggesting that experience contributes significantly to mastery of the driving task.

In an investigation of 104 motor-vehicle casualty accidents, **George W. Brown,** of the University of Iowa, noted that 71% of the drivers were less than 25 years old. Most of the driver-related factors which contributed to the crashes in the study were associated with speed, alcohol, and poor attitude. However, driver factors comprised only 19% of all contributing factors. The prevalent belief that 85% of all crashes are due to driver error stems from the fact that the National Safety Council's standard reporting form lists only 12 possible "contributing circumstances", 10 of them driver-related.

Half of the factors which contributed to the crashes in this study were vehicle-related. Worn and overloaded tires, inadequate vision associated with vehicle design and configuration, and misalignment of front wheels comprised about three quarters of the vehicle-related factors. Hostile vehicle interiors and bumpers, seemingly designed for maximal injury production, were frequently indicted as sources of injury. Small imported cars were disproportionately represented among both single- and multi-vehicle collisions.

The author expressed concern at the great disparity in the sizes of vehicles which are permitted to drive in common traffic patterns; in the discrepancy between posted speed limits and the speeds for which many highways were designed, and in the failure to correlate "no passing" zones with minimum safe passing distances. He concluded that our highway transportation system has failed and the resulting threat to the health of the nation is great enough that major political and social decisions are needed.

In Sweden, as in the United States and many other countries, official statistics on traffic accidents and injuries are based upon police reports. **Jan Thorsen** and **Jens Sande,** from the National Council on Road Safety Research in Stockholm, reported on 2,424 hospital inpatients who had been injured in traffic accidents. Only 581 of these inpatients had been reported by the police as "seriously injured." An additional 536 were reported as "slightly injured." As a result, less than half of all persons whose injuries necessitated hospitalization were reported in the official statistics as having been injured.

Similar studies are needed here in the United States. Planning for emergency and inpatient care of accident victims should be based upon more complete and explicit information than that which is currently available from police statistics. It may not be realistic to expect more precise information from members of the police force, whose work at the scene of an accident involves extrication of the injured, supervision of their removal to hospitals, control of traffic flow, and collection of testimony from witnesses. However, adequate planning of emergency facilities requires that available sources of injury statistics be evaluated and improved, if necessary, before they are used as a basis for decisions.

From the Subcommittee on Traffic Safety of the Medical and Chirurgical Faculty of the State of Maryland

For elderly patients in need of a mild tranquilizer consider **Tybatran®**

brand of tybamate

(When you consult the Prescribing Information you may agree it makes good sense)

PRESCRIBING INFORMATION

Indications: Tybatran (tybamate) has afforded symptomatic improvement in a variety of psychoneurotic disorders, especially in the treatment of the anxiety and tension components of psychoneuroses. Anxiety states manifested somatically have responded to Tybatran (tybamate).

Tybatran (tybamate) has been useful in the control of agitation in the aged and in the alleviation of some of the adverse emotional accompaniments of senility.

Tybatran (tybamate) has been used with benefit in the treatment of depressive symptoms associated with anxiety and other symptoms of psychoneuroses. However, it is not indicated for primary treatment of depressive states. It is not an antipsychotic agent, although it has been used as adjunctive therapy in some psychotic patients.

Dosage: One 350 mg. capsule, 3 times daily and two at bedtime is suggested as the adult starting dose. Adjust to suit individual requirements. Daily doses above 3000 mg. are not recommended.

Contraindications: Known hypersensitivity to tybamate. Since no studies have been done with this drug in human pregnancy, it should not be used in pregnancy unless the potential benefit outweighs the risk.

Warnings: Administer cautiously to patients receiving phenothiazines or other CNS depressants or having history of convulsive seizures (See Adverse Reactions). Consider possibility of additive actions with alcohol or other psychotropic agents, particularly phenothiazines or MAO inhibitors.

Precautions: Avoid abrupt withdrawal after prolonged use, although withdrawal symptoms have not been reported to date. Exercise caution in addiction-prone individuals. If symptoms of hypersensitivity occur, discontinue at once and initiate appropriate symptomatic treatment. Avoid activities requiring optimal mental alertness if drowsiness or vertigo are present. As with any new drug, use cautiously in patients with history of drug allergies, blood dyscrasias, and hepatic or renal disease; periodic measurements of hepatic, hematopoietic and renal function should accompany prolonged and/or high doses.

Adverse Reactions: Most frequent reactions, rarely requiring discontinuation of tybamate, include drowsiness, dizziness, nausea, insomnia, and euphoria. There have been a few reports of skin rash, urticaria, and pruritus. Rare side effects include hyperactivity, fidgetiness, flushing, and tachycardia, suggesting excessive stimulation; also ataxia, unsteadiness, confusion, feeling of unreality, "panic reaction," fatigue, headache, paresthesias, vertigo, gastrointestinal disturbances, glossitis, and dry mouth. Grand mal or petit mal seizures have been reported in a few hospitalized psychotic patients receiving tybamate (up to 6000 mg. daily) together with phenothiazines and other psychotropic agents, but not with tybamate alone. Consider the possibility of rare, serious adverse reactions such as may occur with the related drug, meprobamate. If excessive amounts are ingested, gastric lavage and symptomatic therapy, including central stimulants as necessary, are recommended. Before prescribing, consult package circular.

Supply: Tybatran (tybamate) is available in green, sealed capsules of three strengths: 350 mg., 250 mg., and 125 mg. Each strength is supplied in bottles of 100 and 500.

Death from Narcotics Use

Baltimore City, 1963 through 1968

EDWARD F. WILSON, MD
Assistant Medical Examiner, State of Maryland
Instructor in Pathology
University of Maryland School of Medicine

RUSSELL S. FISHER, MD
Chief Medical Examiner, State of Maryland
Professor of Forensic Pathology
University of Maryland School of Medicine

BALTIMORE city, during 1968, experienced a staggering increase over past years in the number of deaths attributed directly to the use of narcotics. New York,[1] Philadelphia,[2] and Miami [3] experienced similar increases. The purpose of this report is to document various parameters of Baltimore's increase.

Under the Maryland State Post Mortem Examiner's Law [4] any death which is the result, wholly or in part, of narcotics use is a Medical Examiner's case. Every death attributed to the use of narcotics in Baltimore city is autopsied at the Office of the Chief Medical Examiner, and the toxicology necessary to identify and quantitate the naturally occurring and synthetic narcotics in the body fluids and tissues is performed in its laboratory.

As soon as the cause of death is determined, the medical examiner completes the death certificate.[5, 6] The cause of death is also recorded in the daily log maintained by the medical examiners' secretaries. Each "narcotic" death in the log books from 1963 through 1968 was reviewed. After review, one case (69003) was excluded: It was an historically confusing and chemically undocumented suicidal ingestion of methadone.

Table I shows narcotics deaths tabulated yearly by race and sex. The city's white and Negro populations are also recorded in the table. It can be seen that the number of narcotics deaths from 1963 through 1966 averaged approximately eight per year. In 1967, narcotics deaths numbered 17, more than twice the 1963 through 1966 average. In 1968 narcotics deaths totalled 47, approximately three times the number in 1967.[7]

TABLE I: Narcotics Deaths by Race and Sex

BALTIMORE CITY'S POPULATION (in thousands)

	1963	1964	1965	1966	1967	1968
White	570	560	548	538	524	517
Negro	354	362	370	376	386	392
TOTALS:	924	922	918	914	910	909

RACE AND SEX OF NARCOTICS DEATHS

	1963	1964	1965	1966	1967	1968
N/M	6	7	0	1	12	29
W/M	3	2	4	4	3	12
N/F	0	0	0	2	2	5
W/F	0	1	1	0	0	1
TOTALS:	9	10	5	7	17	47

In Table II it can be seen that with the exception of one death, the increase in narcotics deaths from 1967 to 1968 was confined to the ages 12 through 29. The increase in the number of narcotics deaths in the 15 through 19 age group was proportionally greater than in the 20 through 29 age group.

TABLE II: Narcotics Deaths by Age Group

AGE (years)	1963	1964	1965	1966	1967	1968
15-19	0	0	2	1	3	14
20-29	5	8	3	3	12	30
30-39	3	2	0	2	2	3
40+	1	0	0	1	0	0
TOTALS:	9	10	5	7	17	47

In comparing 1967 to 1968, Table III shows that Negro men and Negro women accounted for over two thirds of the increase in total narcotics deaths and for over three fourths of the increase in teenage narcotics deaths.

During 1967 the number of narcotics deaths per consecutive quarter numbered four, six, three, and four. In 1968 the number of narcotics deaths increased in each consecutive quarter from one death during January through March, to 11 deaths and 14 deaths during the second and third quarters respectively, and reached a total of 21 deaths during October through December

In the first quarter of 1969 the number of narcotics deaths totaled 12.

TABLE III: Race, Sex, and Age Group of Narcotics Deaths

Race, sex age group	1963	1964	1965	1966	1967	1968	
N/M 15-19	0	0	0	0	3	10	
N/M 20-29	3	6	0	0	8	16

W/F 40+	0	0	0	0	0	0	
YEARLY TOTAL	9	10	5	7	17	47	

It is believed, probably correctly, that the recent increase in the number of narcotics deaths reflects directly the recent increase in the number of narcotics users.[1] The increase in arrests for narcotics violations in Baltimore city is shown in Table IV. There was a marked increase in narcotics arrests from 1966 to 1967, and a slight decrease in narcotics arrests in 1968 compared to 1967.[8]

TABLE IV: Age Group of Persons Arrested on Narcotic Charges by Baltimore City Police (including those released without having been formally charged) [8]

AGE (YEARS)	1966			1967			1968		
	a	b	c	a	b	c	a	b	c
11-19	24	77	156	61	225	344	71	70	320
20-29	90	15	185	212	31	324	225	63	420
30-39	39	4	56	87	0	111	60	7	95
40-49	18	3	23	31	2	40	27	6	45
50-59	1	0	4	5	0	6	7	2	9
60+	0	0	0	1	0	3	1	0	1
TOTALS	172	99	424	397	258	828	391	148	890
YEARLY TOTALS:		695			1483			1429	

a. Possession/sale of opium, cocaine and their derivatives (morphine, heroin, and codeine)

b. Possession/sale of synthetic narcotics/manufactured narcotics which can cause true addiction (demerol and methadone) c. Violation of narcotics drug laws

From the DRUG USED FROM ARREST EXPERIENCE statistics shown in Table V can be seen the increase in arrests for the sale or possession of narcotics.

The toxicology laboratory at the Office of the Chief Medical Examiner has documented two narcotics deaths involving methadone in Baltimore city. In one, a trace of methadone was found and no other narcotics. In the other death, a trace of methadone was found along with a trace of cocaine.

In 1969, cough syrup was added to the DRUG USED FROM ARREST EXPERIENCE category. Recently reported from Pittsburgh was the first death in the United States attributed to ingestion of non-prescription codeine-type cough syrup.[9]

TABLE V: Drugs Used from Arrest Experience of Baltimore City Police [8]

DRUGS	1967	1968	JAN.-MAY 1969
Sale of Heroin	60	60	26
Possession of Heroin	291	206	236
Sale of Cocaine	2	6	1
Possession of Cocaine	7	41	53
Sale of Methadone	0	26	11
Possession of Methadone	10	141	104
Possession of Morphine	1	4	9
Possession of Dilaudid	4	3	0
Possession of Codeine	5	1	6
Possession of Meperdine	0	1	0
Possession of Cough Syrup	—	—	15
YEARLY TOTALS	380	489	226

Approximately 90% of narcotics deaths unexpectedly and suddenly follow intravenous injection of narcotics, usually heroin.[1] The improvised syringes, needles, empty and full packets of heroin mixtures, spoon or bottle cap cookers containing a small cotton wad, matches, and crude tourniquets are often found in close proximity to the deceased user. Occasionally, loss of consciousness or death occurred so rapidly that the tourniquet was still in place on the arm and the needle stuck in the skin, the syringe partially filled with blood mixed with residual heroin solution, the blood indicative of perforation of a vein by the needle.[10] Overdosage with heroin, contained in the mixture injected, accounts for most of the unexpected and sudden deaths, but probably not for all.

The problem of variable heroin concentration of the mixture injected, the contribution of the non-narcotic portion of the narcotic mixture injected, and the frequency and strength of the narcotics injections taken shortly before death and in the previous period must be considered, as well as the factor of tolerance for heroin which may have been lost during a period of abstinence. What might have been a safe dose prior to abstinence, may prove to be a lethal dose for an addict abruptly resuming his habit.[10]

However, certain unexpected and sudden narcotics deaths are not the result of narcotics overdose, but are probably the result of an idiosyncratic reaction to the injected material. Where death was so rapid that the needle and syringe were still in the skin of the deceased, toxicologic examination of body fluids and tissues has demonstrated only the presence of alkaloid, not overdosage. In deaths immediately following intravenous narcotic injection, rarely is there no evidence of alkaloid in the body fluids or tissues.[10]

The following cases are illustrative of unexpected and sudden death following intravenous narcotic injection. Noteworthy is the fact that six of these men had been released recently from a penal institution and one was actually serving time in a penal institution.

Case #1 (Anne Arundel) *: This 42-year-old Negro man entered the Maryland House of Correction on June 29, 1966. The subject returned from the Maryland Correctional Camp Center to the Maryland House of Correction at 7:30 PM on April 14, 1968. He appeared to be under the influence of drugs or drink and was placed under medical observation. He was "observed" hourly until 8:10 AM on April 15, 1968, at which time he was found dead.

Autopsy disclosed old needle puncture scars in each antecubital fossa and one fresh needle puncture mark in the left antecubital fossa. Toxicology revealed negative blood alcohol, 8.0 mg% morphine in the bile and 0.2 mg% morphine in the urine.

** Not included in Baltimore city narcotics deaths statistics.*

Case #2 (69504): This 16-year-old Negro man was home on a three-day pass from the Maryland Training School. He went to bed at 1:00 PM on August 12, 1968. At 10:00 PM that same day, there was no response to attempts to awaken him. He was taken to the hospital where he survived for two days. Autopsy, at the Office of the Chief Medical Examiner, disclosed lobar pneumonia as the immediate cause of death. Autopsy also disclosed old needle puncture scars in the left antecubital fossa, and a recent or fresh needle puncture mark in each antecubital fossa. Toxicology revealed a trace of methadone and a trace of nalline in the bile.

Case #3 (57763): This 24-year-old Negro man entered the Maryland House of Correction on December 23, 1963, and was released on June 18, 1964, at 8:40 AM. He was found dead in a park on June 19, 1964, at 7:05 AM. Autopsy disclosed old needle

puncture scars and one fresh needle puncture mark in the right antecubital fossa. Toxicology revealed negative blood alcohol, negative blood barbiturate, 0.5 mg% morphine in the bile, a trace of morphine in the urine, and a trace of codeine in the urine and bile.

Case #4 (57840): This 39-year-old Negro man served a year for robbery in Maryland House of Correction and was released on July 6, 1964. He was found dead on July 8, 1964, at 8:25 AM. "We cooked up the stuff, I took off first; I put it in the vein of my left arm, then Ben (the deceased) used a belt as a tourniquet for one of his legs . . . and shot heroin. After Ben took off, he sat still for a moment, and then suddenly he jerked and fell forward. . . . I felt for a heart beat and I also felt his pulse and it seemed to be weak." The witness left the scene and it was not certain how long the deceased survived at the scene of death. Autopsy disclosed old needle puncture scars in each antecubital fossa, both forearms, the right lower leg, and a fresh needle puncture mark in the medial aspect of the left lower leg. Toxicology revealed negative blood alcohol, 5.6 mg.% morphine in the bile, and a trace of morphine in the urine.

Case #5 (68572): Because of narcotics violations, this 19-year-old white man had been confined for a few months at the Hagerstown Correctional Institute. He was released from the Hagerstown Correctional Institute at 3:00 PM on April 8, 1968, and arrived home at 6:00 PM on the same date. His mother stated that he remained at home until she left for work at 8:00 AM on April 10, 1968. Her son was found dead on his back alongside tire tracks in the woods, approximately 35 feet from a road on April 12, 1968, at 6:30 AM. Autopsy disclosed old needle puncture scars in each antecubital fossa, three recent needle puncture marks and a fresh needle puncture mark in the left antecubital fossa. Toxicology revealed negative blood alcohol. Narcotics were not detected in the urine or bile.

Case #6 (55409): This 24-year-old Negro man was imprisoned for robbery on March 26, 1963, and released on August 13, 1963. On August 17 at 7:45 PM he was found dead on a couch in the living room of friends. There were an eyedropper-type syringe, two needles, a spoon with a burned bottom, and an empty glassine envelope on the bureau in the adjacent bedroom. Autopsy disclosed only old needle puncture scars in the left antecubital fossa. Toxicology revealed negative blood alcohol, negative blood barbiturate, negative urine amphetamine, 4.0 mg% morphine in the bile, and 0.4 mg% morphine in the urine.

Case #7 (66008): This 25-year-old Negro man entered the House of Correction February 15, 1967, and escaped on May 8, 1967. On May 13, 1967, at 9:00 PM, he asked to use the toilet at a gas station. At 10:30 PM he was found dead on the bathroom floor. Beside the body were the "works." Autopsy disclosed old needle puncture scars in each antecubital fossa and fresh needle puncture marks in each forearm. Toxicology revealed negative blood alcohol, negative bile narcotics, a trace of codeine in the urine, a trace of morphine in the urine, quinine in the syringe, and heroin and quinine in the bottle cap.

Case #8 (69264): On July 14, 1967, at 6:50 AM, this 20-year-old Negro man was found on the ground in back of a house. Autopsy disclosed numerous old needle puncture scars in each antecubital fossa. There was a fresh needle puncture mark in the right antecubital fossa. Toxicology revealed negative blood alcohol, a trace of methadone in the urine, and a trace of cocaine in the urine. There were no narcotics in the bile.

Case #9 (70957): On January 30, 1969, this 19-year-old Negro man was found dead, fully clothed, sitting upright in an easy chair with a syringe attached to a needle sticking in the skin of the left antecubital fossa. A nylon stocking tourniquet was around the left upper arm. Tweezers and a bottle cap were on the right arm of the chair. Capsules with white powder were found on the bureau in the adjacent bedroom. Autopsy disclosed old needle puncture scars in each forearm. In the left antecubital fossa there was a 20 gauge needle attached to an eyedropper with a rubber bulb top. The eyedropper was partially filled with blood. Toxicology revealed negative blood alcohol; 0.1 mg% morphine in the urine; quinine in the urine; 0.6 mg% morphine in the bile; heroin, morphine, and quinine in the skin of the injection site; heroin, morphine, and quinine in the syringe; heroin and quinine in the bottle cap; heroin and quinine in the packet and a trace of quinine in a capsule.

Sacculotomy in the Treatment of Meniere's Disease

The treatment of Meniere's disease has long been a therapeutic enigma as testified to by the many and varied methods in use today.

In this paper, the features of Meniere's disease will be discussed, with a recent surgical procedure reported that has yielded gratifying results in six patients.

N. EDWARD NACHLAS, MD

Johns Hopkins Hospital

DONN DUNCAN, MD
Resident in Otolaryngology
Johns Hopkins Hospital

Historical Background

Prosper Meniere, in 1861, presented a paper describing the triad of symptoms that were taken to constitute the disease (or syndrome) that was to bear his name: tinnitus, hearing loss, and vertigo. He was the first to correlate these symptoms with inner ear pathology, as reports of similar cases prior to that time were diagnosed as a form of "apoplectiform cerebral congestion." It is of interest to note that the primary purpose of Meniere's paper was to establish the relation of the inner ear to the symptoms described, rather than to describe a definite disease entity.

Etiology and Pathology

The basic pathology in Meniere's disease is gross distention of the endolymphatic system with degenerative changes in Corti's organ. This endolymphatic hydropexis usually extends throughout the endolymphatic system, but may occur in the sacculocochlear region. Since the term Meniere's disease describes a symptom complex, the specific condition with this pathogenesis may more appropriately be called hydropexis of the labyrinth and cochlea. The supposed causes of Meniere's disease are quite varied. Many factors have been suggested as being primary or contributing causes including allergy, metabolic disturbance, histamine sensitivity, focal sepsis, psychosomatic factors, vitamin deficiency, and inflammation. Present day literature would tend to support a hypothesis based on vasomotor imbalance with abnormality either in the overproduction, or the lack of absorption, of the endolymph.

Clinical History

Three predominant subjective symptoms compose the classic triad; vertigo, tinnitus, and decrease in auditory acuity.

The cardinal, and most distressing symptom to the patient is rotatory vertigo. Characteristically, its presentation is explosive and the patient frequently does not have a warning aura. A relationship to position, activity, or time period is not evident. In some, a sensation of fullness or pressure in the involved ear may precede an acute attack.

The vertiginous episodes are usually relatively short, and are measured in minutes or hours, not in days or weeks as so often characterizes intracranial disease. The severity of the attack is variable, but generally is described as moderate to marked and is often accompanied by loss of spatial orientation and falling toward the affected ear. Nausea and vomiting frequently accompany the attack. The patient is, however, free of these symptoms between attacks.

In contrast, tinnitus may be present constantly, immediately preceding, during, or following an attack. It is described as a roaring, non-pulsing, low-pitched type of tinnitus. This symptom may be so slight as to be overlooked by the patient in the early part of the disease, but as it progresses, it becomes a more prominent feature, although rarely a disabling one.

Hearing loss in Meniere's disease is of the perceptual or neural type and varies from one attack to another. During initial attacks, the patient will complain of a decrease in hearing acuity, frequently with return to normal thresholds during the recovery period. With subsequent episodes, the hearing acuity becomes more impaired. This phenomenon is repeated with each attack and the result is a moderate to severe hearing impairment in the untreated patient. Early, the low frequencies are affected, but gradual involvement of all frequencies is the usual picture.

Since Meniere's disease is regarded as a unilateral process, the above symptoms are localized usually in one ear, although 10% of the patients manifest bilateral involvement.

Physical Examination

Unless the patient is seen during an acute crisis, physical examination will yield little information aside from detectable hearing loss. If seen during an acute episode, some or all of the following may be present:

- Nystagmus—Present only during an acute attack. The jerky movement of the eye is directed away from the affected ear.
- Spatial disorientation—Signs of severe disorder in equilibrium with staggering and falling toward the affected ear when attempting to walk.
- A tendency for the patient to lie down in a rather rigid, fixed position with the affected ear down.
- Absence of convulsion or pain.
- Preservation of consciousness during the attack.
- Nausea, often followed by vomiting.

Audiometric and Vestibular Testing

Visual examination of the ear usually reveals normal findings unless there is a coexisting pathologic state. Tuning fork tests (512 cycles per second) will be consistent with a neural hearing loss, ie, air conduction will be greater than bone conduction. The Weber test will lateralize to the uninvolved ear if there is more than minimal loss.

Recruitment, an abnormal sensitivity to increased loudness, is often found in patients with Meniere's disease. This may be clinically tested with tuning forks (preferably a 512 or 1024 cycles per second) by comparing the hearing in both ears after hitting the forks softly and again after hitting them harder. In the former, the patient will state he hears the tone better in the uninvolved ear, while in the latter maneuver he is likely to be unable to differentiate between the two ears, or even state he hears better in the affected ear; ie, hyperrecruitment. This phenomenon remains unexplained, but is associated with hearing losses that occur primarily in the cochlea. This phenomenon is also demonstrated by more sophisticated tests including loudness balance tests, short increment sensitivity index (SISI), and Bekesy audiometric tests.

Diplacusis binauralis dysharmonica is another finding frequently existing in Meniere's disease. The patient complains of hearing the same sound as a different pitch in the two ears, usually the higher pitch being heard in the involved ear.

Loss of speech discrimination is a frequent complaint and a consistent audiometric finding. The discrimination score is much lower than one would expect from the pure tone audiogram. Patients complain that speech is audible, but not understandable.

Specific audiometric testing can verify all the impressions in addition to accurately assessing the degree of hearing loss.

Vestibular testing is of value in diagnosis as the responses to calorics often are hypoactive. However, even in severe cases the caloric study may be normal. As mentioned previously, nystagmus is present only during an acute attack.

Treatment

Successful control of 85% to 90% of Meniere's disease patients can be obtained by medical therapy, though this is rarely completely satisfactory. There is no specific medical therapy for hydropexis.

Medical treatment falls into two areas; the acute vertiginous episode, and the interim periods.

Treatment of the acute vertiginous episodes is largely supportive and symptomatic. The patient is given antiemetic and antimotion-sickness medications, in addition to sedatives, to reduce the anxiety that invariably accompanies the attacks. Intravenous histamine often gives prompt relief of the symptoms.

Therapy in an interim period is directed at forestalling and reducing the severity of future attacks. The patient should be placed on a moderate low salt diet and a restricted fluid intake. Supplemental therapy with histamine and vasodilators has been advocated; the dosage and timing vary, however. The difficulty of properly evaluating medical treatment is apparent when we realize that spontaneous remissions often occur after symptom-free periods and may last as long as ten years without treatment. Two drugs often used in this condition,

betahistine hydrochloride *(SERC)* and Lipoflavanid Complex, are under investigation by the FDA at the present time.

Surgical therapy is reserved for those patients who are not controlled by vigorous medical management. These individuals suffer from frequent attacks that are often incapacitating and may threaten loss of employment. Severe emotional disturbance may play an important role as the patient is often fearful of another attack, and indeed the patient often may appear psychoneurotic as a result.

Surgical procedures, like medical regimens, have changed frequently due to lack of uniformly successful results with any specific approach. Posterior fossa sectioning of the vestibular nerve, which carried a relatively high morbidity and occasionally a mortality rate of significance, is rarely done today. Neurosurgical section of portions of the vermis are occasionally done.

Approaches to the inner ear with the operating microscope have vaulted the otologic surgeon to the forefront in the surgical management of this disease. Various operations to destroy the labyrinth by electrocautery, ultrasound, and cryosurgery, as well as endolymphatic shunt and vestibular nerve section through an otologic approach, give relief. The majority of these procedures are performed to relieve the vertigo. The destructive procedures usually destroy the hearing as well as the labyrinthine function. In addition, some of the procedures are long and technically difficult, and produce undesirable morbid reactions.

Discussion

Fick, in 1964, reported a series of 50 patients with severe vertigo, all but three suffered from Meniere's disease. In a recent report on over 100 patients, he confirmed his initial findings. He described the method of endolymphatic decompression used in the following cases.

Fick stated that in 60% of his patients, vertigo disappeared and in an additional 16%, hearing was restored to normal with no recurrence of tinnitus. This was an absolute case rate of 76% for vertigo, the main indication for the operation. Ten percent more related an improvement in the vertigo.

The surgical procedure is done under local anesthesia. A tympanomeatal flap is raised (Illust. I, a) and by removing a portion of the posterior superior bone of the canal the following are visualized: (Illust. II) the incudo stapedial joint, the pyramid, the stapedial tendon and the footplate of the stapes (Illust. I, b, c, and Illust. II). With a perforator, an opening is made in the footplate (anterior) and the saccule is decompressed. A light dressing is inserted to keep the tympanomeatal flap in place.

Case Reports

Case 1: W. G., 60-year-old man with severe recurrent episodes of vertigo accompanied by nausea and vomiting for about four months duration—

The patient was treated medically during this four-month period for Meniere's disease. His symptoms progressed and his hearing deteriorated to the degree of a total loss of clinically serviceable hearing. Sacculotomy was performed 12/13/66 and the patient was relieved of all the symptoms except the hearing loss which remained unchanged. He has remained free of symptoms.

Case 2: W. S., 40-year-old man with a six-year history of episodic vertigo, spatial disorientation, nausea, vomiting, tinnitus, and progressive hearing loss in the left ear—

The neurological evaluation was reported as normal; audiogram showed non-functioning left ear; vestibular studies were consistent with a hypofunctioning labyrinth. Sacculotomy on 9/1/65 brought about a prompt relief of the vertigo.

Case 3: A. L., 67-year-old woman with severe tinnitus and dizziness, but without nausea or vomiting. There was moderate hearing loss—

The patient had a history of emotional disorder some years prior to onset of present neurologic complaints. Sacculotomy on 4/12/66 yielded improvements of symptoms although the patient continued to complain on rare occasions of fleeting episodes of dizziness. There was also some improvement in hearing.

Case 4: N. O., 68-year-old man with severe intermittent vertigo, tinnitus, and profound hearing loss—

Audiometric and vestibular studies performed on this patient were consistent with the symptoms of Meniere's disease. Sacculotomy on 9/23/65 brought prompt relief of symptoms. The hearing was unchanged.

Case 5: S. F., 54-year-old man with clinical evidence of Meniere's disease confirmed by audiometric and vestibular testing—

The patient had total loss of hearing in the involved ear. Sacculotomy was done on 7/13/67. Follow-up showed patient free of all vertigo and marked reduction in the tinnitus. The hearing remained unchanged.

Case 6: P. B., 40-year-old man with incapacitating vertigo and severe hearing loss in the left ear—

Sacculotomy on 12/23/65 provided prompt relief of vertigo and moderate improvement in the hearing. Patient remained well for two years and then suffered mild attacks of vertigo with diminution in the hearing. The vertigo was relieved promptly with medical therapy.

We do not intend to infer that this procedure offers a complete answer to the surgical treatment of hydropexis. Although the number of cases presented here are few, this direct and relatively simple surgical approach appears to have merit in selected cases of Meniere's disease.

Summary

There are several advantages to this approach which the authors feel make it a treatment of choice: (1) The surgical approach is relatively simple and can be performed using local anesthetic agents; (2) the operative time is short, usually 30-45 minutes; (3) relief is almost immediate; (4) the post-operative period is likewise brief, 2-3 days; (5) return to normal routines can generally be expected within a week's time; (6) destruction of the labyrinth is not performed, thus allowing the patient to qualify for repeat fenestration or other surgical procedures.

The process of wound healing has a high biological priority. Most wounds heal completely within a relatively short period of time, in spite of preoperative starvation, infection, or increased force against their tensile strength.[1-3] A few wounds do not heal, but disrupt. Many factors play a role in the disruption of a laparotomy wound: increased intra-abdominal pressure, metabolic state of the patient, wound infection, and surgical technique. Occasionally, disruption occurs in a young, healthy patient in an otherwise uncomplicated postoperative course after elective surgery; it's as if the healing process has suffered an arrest.

This paper is a comparison of the frequency of wound disruption after abdominal operations in St. Joseph Hospital with that reported in the literature, and an evaluation of the predisposing causes in an effort to prevent this complication.

Wound Disruption After Abdominal Laparotomies

ROBERTO O. FERRER, MD
St. Joseph Hospital

Clinical Material

During the two-year period of this study, ending December 31, 1967, 2,058 laparotomies were performed at St. Joseph Hospital. In 37 of these cases, wound disruption occurred, a 1.8% incidence. (Excluded from this study were 347 appendectomies, done through McBurney's muscle-splitting incision, because there was no reported disruption following this type of incision; and repair of inguinal hernias.)

The incidence of abdominal wound disruption, reported in the literature, is from 1.5% to 3%.[2,5]

Twenty-two men and 15 women—a ratio of 1.5:1—were included in this study. This is a lower predominance of men compared to other series: Lehman et al[4] found the ratio to be 2.8:1; and Efron's ratio was 2.2:1.[2] This lower incidence of wound disruption in women has been explained by a more relaxed abdominal wall due to pregnancy, predominant chest breathing, and less physical activity. Most of the women in this study (80%) had had pregnancies; two of them had wound disruption after the laparotomy for cesarean section.

The age range was from 21 to 84 years. (Little pediatric surgery is done in this hospital which may account for the absence of such cases in the pediatric age group.) Sixteen of the patients, 43%, were more than 50 years old; usually there is a higher incidence of wound disruption in the older age group, but no explanation has been found for the predominance of younger people in this study.

The duration of the operation did not seem to be related to this complication of abdominal surgery.

The operative time ranged from less than one hour to more than four—most of the procedures were completed in less than three hours. General anesthesia was administered in all except two cesarean sections that were done under spinal anesthesia.

Wound disruption may happen any time during the postoperative period. In this series, the earliest instance occurred on the third postoperative day, and the latest was on the 28th. The disruptions were recognized usually between the 5th and 12th postoperative day—32 patients, 86%, fell into this range.

It is an accepted phenomenon that disruption before the 5th day cannot be blamed on poor wound healing;[1,2] this is "mechanical disruption" because the disrupting force on the wound is greater than the tensile strength of the sutures and the tissues in which they are placed. Early disruption reveals some technical fault in the suture material, or the method of closure. In this study, five patients had wound disruptions before the 5th day. One patient had delirium tremens and the sutures were seen cutting through the fascia at the closure of evisceration. Another patient suffered from cough and acute gastric dilatation; and the other three had severe coughs. Retention sutures had not been used on any of these five patients. A layered closure had been executed using chromic catgut in the peritoneum and fascia in one case, chromic catgut in the peritoneum and non-absorbable material in the fascia in the other four.

Predisposing Causes of Wound Disruption

Wound Infection: Infection of the disrupted wound was found in five patients, 13%; but cultures of the wounds were taken only if the infection was clinically evident.

Mechanical Causes: In this group all the mechanisms which produce increased intra-abdominal pressure were observed: cough, vomiting, retching, hiccoughs, and abdominal distention. Such causes were encountered in most of the cases of wound disruption. Twenty-five, 67%, had one or more of these complications. Obesity may be a cause of intra-abdominal pressure and in the case of two of the patients in the study, obesity may have been one of the additional complications. One of these patients, a 35-year-old man, also had mild coughing in the postoperative period; and the other, a 21-year-old woman, had mild vomiting during the first two postoperative days.

Metabolic Causes: The evaluation of the metabolic factors is sometimes a question of clinical judgment: The routine laboratory determinations do not always give a true picture of the metabolic state. For example, Localio et al[5] have demonstrated that the level of tissue proteins is not always in direct proportion to plasma-protein concentration. The study conducted at the hospital showed that depletion of protein in the fascia is an important factor in the cause of wound disruption. In many of Localio's cases, the plasma protein was within normal limits. The better known metabolic factors that may be involved in the causes of disruption are anemia, hypoproteinemia, and hypovitaminosis C.

Chronic anemia is a recognized factor of poor wound healing.[1,6,7] It also indicates hypoproteinemia.[7] Four patients in the series had hemoglobin below 10 gm%. They were bleeding from the gastrointestinal tract—two had peptic ulcers, and the other two had esophageal varices due to liver cirrhosis. Hypoproteinemia was present in the two patients with liver cirrhosis. The relationship of hypoproteinemia to the disruptions was not evaluated in this study because routine determinations of plasma proteins were not done in either the preoperative work-up or after the disruption occurred.

Saslov and Dunphy have demonstrated that steroids inhibit wound healing when started in large doses before the operation, but that they do not interfere with the healing of the disrupted wound when it is resutured.[8] One patient in this series was under corticoid therapy because of rheumatoid arthritis. At the time of surgery, his tissues were found to be very friable. No retention sutures were used in this case. The wound disrupted on the 8th postoperative day; it healed after being resutured.

Ascorbic acid is necessary for fibroblasty in the healing wound: The concentration of ascorbic acid in the leucocytes is in direct relationship with healing.[1] Many wounds heal in spite of low plasma concentrations of vitamin C, but they do not heal at all when the leucocytes are depleted of this vitamin, such as occurs in far-advanced scurvy. Hartzell et al have found that a drop in ascorbic acid levels occurs in plasma after a major operation, and during infections.[3] They also found low levels in patients with malignant tumors of the gastrointestinal tract, and peptic ulceration. Lehman et al have found a 4.6% incidence of laparotomy wound disruption in patients having carcinoma of the gastrointestinal tract: In the same series, they reported only 2.1% in patients without this malignancy.[4] Hypoproteinemia, hypovitaminosis C, and cachexia are more frequent in the cancer patients, which explains this higher incidence.

Mortality

Four patients, 11% of the series of 37, died following wound disruptions. One had a right hemicolectomy for carcinoma. She was 84 years old and developed pneumonia. The immediate cause of death was found at autopsy to be acute myocardial infarction.

Another patient who died had a partial gastrectomy for a bleeding duodenal diverticulum. She developed wound disruption and dehiscence of the duodenal

stump. The wound was resutured and the duodenal stump was drained. She suffered a second disruption and died 12 days after it was again resutured. The terminal cause was pneumonia.

The third patient in this group was a cirrhotic who sustained a partial gastrectomy for a bleeding duodenal ulcer. He developed delirium tremens after surgery, and eviscerated in the 3rd postoperative day. He died ten days after this complication developed. Liver cirrhosis and ascites were found in the autopsy.

The fourth patient was another cirrhotic who had an exploratory laparotomy because of jaundice. He had emphysema and severe hypoproteinemia (albumin 2.6%, globulin 3.3%). He went into hepatic coma, had wound disruption on the 16th postoperative day, and died five days later. Aspiration pneumonia was the immediate cause of death.

The underlying disease and physical condition of the patient is usually responsible for the outcome of the wound disruption. In none of the above cases was the disruption the immediate cause of death.

Surgical Procedure

In Table 1 are grouped the various surgical procedures and the diseases for which they were undertaken. Only the main procedures are tabulated. Incidental appendectomies; oophorectomies in cases of hysterectomy; vagotomy in cases of gastrectomy, and repair of hiatal hernia are not counted.

Table 1: Surgical Procedures

Hysterectomy (1 cancer, 7 fibroids)	8
Cholecystectomy	6
Partial gastrectomy (ulcer)	5
Repair of esophageal hiatal hernia	5
Exploratory laparotomy (gunshot wound, liver biopsy)	2
Hemicolectomy (cancer)	2
Cesarean section	2
Release of adhesions	1
Release of volvulus of the sigmoid	1
Hemostasia of torn mesenteric vessels	1
Appendectomy	1
Cholecysto-jejuno anastomosis (cancer of the pancreas)	1
Oophorosapingectomy	1
Excision of entero cutaneous fistula and partial resection of small bowel (Crohn's disease)	1

In this series there is an unusually high incidence of disruption after gynecological operations. All of them but one had been done through a lower midline incision and the laparotomies were closed in layers with chromic catgut. In one year, 1967, 513 "pelvic laparotomies" were done on women, all through a lower midline incision. Almost every one of them was closed with chromic catgut. There were seven wound disruptions in this group—an incidence of 1.2%. This is not much lower than the general incidence of 1.8% for all the laparotomies in two years (1966 and 1967). Less incidence of disruptions for the lower midline incision is generally reported. In this series the difference is not very significant.

Surgical Technique

Different types of incisions and suture techniques have been used in these cases; they are classified in Tables 2 and 3. One of the transverse incisions was a right subcostal for cholecystectomy, the other was a bilateral subcostal for repair of hiatal hernia and cholecystectomy. In this hospital most surgeons favor the right subcostal incision for cholecystectomy. Only one disruption occurred through this incision compared to five after cholecystectomy through a right paramedial incision.

Table 2: Type of incision

Upper midline	4
Lower midline	10
Upper left paramedian	5
Lower left paramedian	1
Upper and lower left paramedian	2
Upper right paramedian	9
Lower right paramedian	1
Upper and lower right paramedian	3
Transverse	2

Table 3: Type of closure

Continuous chromic catgut in the peritoneum, interrupted chromic catgut in the fascia	16
The same as above plus retention sutures	3
Continuous catgut (chromic or plain) in the peritoneum, non-absorbable, interrupted sutures in the fascia	18

In the three patients who had a layered closure of chromic catgut, supplemented with retention sutures (#2 nylon), the disruption occurred on the 6th, 10th, and 11th postoperative days with the retention sutures in place.

Closure of the Disrupted Wound

It has been demonstrated by Saslov and Dunphy that the healing of the disrupted and resutured wound follows an accelerated pattern.[8] The onset of the fibroplasty seems to be earlier without the usual latent period. In 32 cases, the wounds were resutured using through and through retention sutures of #2 nylon. In the other five cases, they were closed in layers, supplemented with retention sutures in one. The resutured wound healed well in 33 cases. No information of the degree of healing was available in the patients who died.

Conclusion

Abdominal wound disruption remains a postoperative complication in spite of the knowledge about wound healing and the predisposing causes of the

disruption. It is usually found to be a combination of causes which leads to the complication. Prevention has to start during the preoperative work-up of the patient, with correction of anemia, hypoproteinemia, hypovitaminosis C, improvement of ventilation, and treatment of infection in patients with chronic lung disease. Anemia is readily recognized and easily corrected by transfusions. Hypoproteinemia is difficult to overcome by parenteral administration of plasma or concentrated albumin, but a trial has to be done in patients who have hypoproteinemia and edema because they are highly susceptible to wound disruption. Low levels of ascorbic acid should be suspected in all undernourished patients and in those with gastrointestinal malignancy. Administration of ascorbic acid has to be routine in these patients.

It is difficult to evaluate the importance of the surgical technique because it has been shown that wound disruption occurs with every kind of suture material and with every suture technique. However, there are enough reports in the literature to show that laparotomies closed with vertical "figure eight" sutures in one layer have a lower incidence of disruption.[4-10] In high-risk patients, that is, those with chronic lung disease, gastrointestinal malignancy, cirrhosis, edema, anemia, etc., the use of retention sutures may avert the disruption (and should this occur, prevent the evisceration). When retention sutures are used, the time to remove them is after a firm healing ridge is palpable along the line of incision.[11]

Summary

Thirty-seven wound disruptions occurring in 2,058 laparotomies in a period of two years are analyzed. Many factors may play a role in this complication; increased intra-abdominal pressure is the most constant. Different types of suture materials used in a layered closure do not make a difference in the incidence of disruption. It is suggested that the correction of metabolic deficiencies, the use of vertical "figure eight" sutures, and prevention of intra-abdominal pressure will reduce this postoperative complication.

The incidence of moderate to severe pulmonary fibrosis following radiotherapy for mediastinal Hodgkin's disease was 68% in 21 patients. The corresponding incidence in 20 patients with bronchogenic carcinoma was 75%. Severe symptoms occurred in 10% of the patients with Hodgkin's disease one year after radiotherapy, while the incidence of severe symptoms among the patients with bronchogenic carcinoma was 30%. No patients died due to causes arising from the pulmonary fibrosis.

Pulmonary Fibrosis Following Radiotherapy For Bronchogenic Carcinoma and Hodgkin's Disease*

H. GUNTER SEYDEL, MD, MS
Chief, Department of Radiology
American Oncologic Hospital
Philadelphia

J. MAUN, MD
Resident in Radiology
University of Maryland Hospital

Pulmonary fibrosis has long been recognized as a possible complication of radiotherapy, and recent reviews of this sequela of irradiation have been published by Deeley,[1] Smith,[2] and Whitfield et al.[3] The unusual incidence of severe reactions at relatively low doses in patients with lymphomas has been reported by Taylor,[4] Smith,[5] and Wiernick.[6] Holt [7] also implied that the pulmonary reaction in patients with what he called "leukemic and allied disorders" can be expected to be more severe than in other patients.

To evaluate whether the incidence of pulmonary fibrosis is indeed higher in patients treated for Hodgkin's disease than in a group of similarly treated patients with bronchogenic carcinoma, we are reporting here on the incidence of this finding in 21 patients with Hodgkin's disease and 20 patients with bronchogenic carcinoma, all of whom survived at least one year following radiotherapy to the mediastinum.

Methods and Material

Twenty-one patients with Hodgkin's disease of the mediastinum received radiation therapy with midline tumor doses of 3500 to 4000 rads, using parallel opposing portals without correcting for lung absorption. Most of the patients underwent treatment using a cobalt 60 irradiator. The treatment time was approximately four weeks. Chest X-rays were obtained before treatment, and three months, six months, and one year after treatment.

The 20 patients with bronchogenic carcinoma received a tumor dose of 4000 to 4500 rads to the entire mediastinum and the primary tumor by parallel opposing portals, and an added dose of 1500 to 2000 rads was usually given to the involved nodes and primary tumor using rotational therapy. No lung correction factors were applied. The treatment was given at approximately 1000 rads per week. These patients also had chest X-rays before treatment, and three months, six months, and one year after therapy.

From the large number of patients receiving radiation therapy for bronchogenic carcinoma, the majority had to be excluded because of one of the following reasons: prominent masses which could not be distinguished as either recurrent or persistent tumor, or pulmonary fibrosis; postoperative changes which did not allow accurate evaluation of the lung parenchyma regarding the presence or absence of pulmonary fibrosis; pleural fluid obscuring part of the lung parenchyma or producing secondary changes; atelectasis which either persisted or occurred following radiotherapy, and again prohibited the accurate evaluation of the pulmonary parenchyma.

The chest X-rays were graded as either no evidence of pulmonary fibrosis, minimal, moderate or severe fibrosis. "No evidence of fibrosis" indicated the fact that there had been no appreciable change in the appearance of the broncho-vascular markings or pulmonary parenchyma from the pre-treatment

* *Presented at the Meeting of the Maryland Radiological Society, Baltimore, Maryland, March 21, 1968. Supported by the National Institute of Health, grant # CA 06518-03.*

film. If there was a discernible increase in the pulmonary markings in the treated area, this was called minimal fibrosis. In patients with moderate fibrosis, there was evidence of opacification of part of the lung parenchyma, usually fluffy in nature and containing definite areas of aeration within the opacified areas, sometimes also associated with a slight loss of volume of the affected lung. Severe fibrosis was roentgenographically evident by dense opacification with coalescence of the above mentioned fluffy areas, usually no areas of aeration within the densely opacified area, and frequently with partial atelectasis, loss of volume of the affected lung, elevation and later tenting of the diaphragm. The pulmonary fibrosis was always limited to the irradiated lung.

To correlate these changes on the chest X-ray with the symptomatology in the patient, the patient's symptoms were graded as absent, mild, and severe. Mild symptoms consisted of a slight cough and slight shortness of breath, which did not require medication other than a cough remedy. As a rule, these patients did not suffer enough disability to require them to take time off from work. Severe symptoms were demonstrated by shortness of breath at rest or during mild exertion, and by coughing and elevation of temperature. They, on the other hand, were usually associated with a more severe disability requiring a decrease in workload. These patients usually required treatment with a combination of antibiotics and steroids, in addition to the use of expectorants or cough preparations.

Results

Table 1 shows the results of chest X-ray examinations in patients with Hodgkin's disease. It becomes evident that the incidence of the moderate and severe changes increased with time after treatment, and the maximum of the severe changes was present in the twelve-month group. Only 8% of the patients never showed any evidence of pulmonary fibrosis, although an additional 23% demonstrated only minimal changes. On the other hand, in correlating the symptomatology, it was evident that at one year after treatment the symptoms usually subsided, requiring little or no medication. No fatalities have been attributed to the fibrosis. These patients, however, do have a greater susceptibility to pulmonary infections. Some shortness of breath during moderate to severe exertion also may persist.

TABLE 1: Patients with Hodgkin's Disease

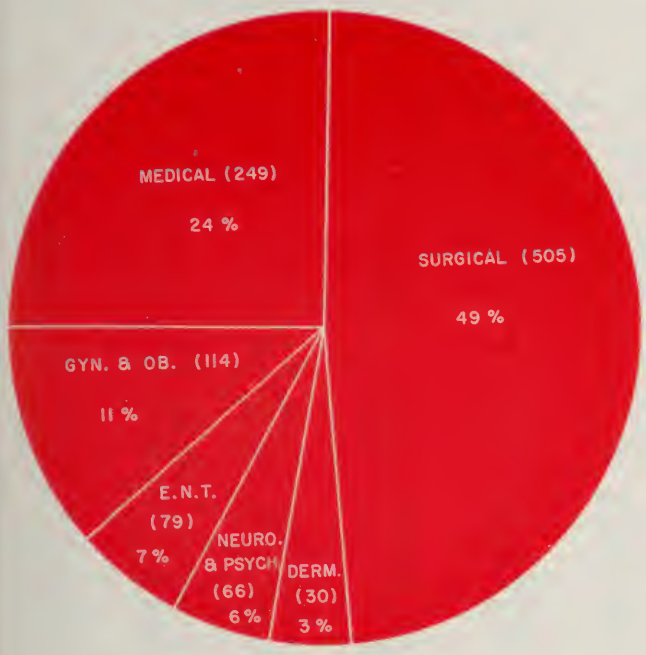
	3 mo.	6 mo.	12 mo.
Pulmonary Fibrosis, Minimal	25%	30%	23%
Pulmonary Fibrosis, Moderate	37%	38%	38%
Pulmonary Fibrosis, Severe	12%	23%	30%
Mild Symptoms	25%	20%	15%
Severe Symptoms	5%	20%	10%

The results in patients with bronchogenic carcinoma are shown in Table 2. Here, there is a fairly rapid increase in the percentage of patients with moderate to severe evidence of pulmonary fibrosis on chest X-ray, and this reaches a maximum at 12 months. Table 2 also shows that the symptomatology in these patients increased significantly toward the 12th month. However, in none of these patients was there any evidence that recurrent tumor was responsible for the symptoms at the time.

TABLE 2: Patients with Bronchogenic Carcinoma

	3 mo.	6 mo.	12 mo.
Pulmonary Fibrosis, Minimal	40%	25%	17%
Pulmonary Fibrosis, Moderate	20%	50%	50%
Pulmonary Fibrosis, Severe	13%	6%	25%
Mild Symptoms	25%	30%	30%
Severe Symptoms	0%	25%	30%

Discussion



Comparison of the figures presented reveals that the patients with Hodgkin's disease seemed to develop pulmonary fibrosis slightly earlier than those with bronchogenic carcinoma, although the over-all incidence was approximately the same. Only 8% of both groups did not show any evidence of pulmonary fibrosis. However, one year after irradiation, the symptoms referable to the pulmonary fibrosis were significantly more severe and more prevalent in the patients treated for bronchogenic carcinoma. It is difficult to exclude that some of the patients were not already developing some degree of recurrence and that some of their symptoms were not referable to this, however, the previously enumerated steps were taken to exclude this for the patients under investigation. Also, as described, there are some differences in dose and volume of irradiation between the two groups of patients. Furthermore, the two groups are not entirely comparable because of the age incident and natural history of the diseases.

An important finding is that, even though symptoms are present and some morbidity is associated with pulmonary fibrosis, no patients treated for Hodgkin's disease died of this sequela of radiotherapy. Because of the irreversible nature of the fibrotic changes in the lung, extreme care should be taken to protect the normal lung as much as possible during irradiation.

Emergency Room Problems of An 'Inner Core' City Hospital

An In-Depth Analysis of the Emergency Department, Bon Secours Hospital

WILLIAM E. BEAVEN, MD
Director, Emergency Department
Bon Secours Hospital

JUAN F. SORDO, MD
Assistant Director, Emergency Department
Bon Secours Hospital

PATRICIA WHELTLE, RN
Head Nurse, Emergency Department
Bon Secours Hospital

For the compilation of most of the statistical material used in this article, the authors wish to express appreciation to Mrs. Joyce A. Tucker, Director of Ward Secretaries, Bon Secours Hospital.

In 1958 the United States Public Health Service [1] was startled to find that the annual number of patient visits to hospital emergency rooms across the country had increased to 17 million, an 81% increase over 1954. By 1967, this figure reached 44 million. Sanford,[2] in an exhaustive study of outpatient facilities in hospitals in the state, calls this trend in escalating outpatient visits a fact of life requiring continual analysis in order to determine a way to cope with it.

Typical of this trend in rapidly expanding emergency services are the public and privately owned hospitals of metropolitan Baltimore. Recently compiled statistics, published by the Hospital Council of Maryland, Inc.,[3] shows that the annual number of patients visiting the 22 Baltimore hospital emergency rooms increased from 340,000 in 1960 to over 582,000 in 1967, a percentage increase of 71.4, or approximately 10% per year (Table I).

Table 1 shows that many of the more rapidly expanding emergency services are occurring in hospitals that have recently moved from a downtown location to the suburbs (St. Joseph and Sinai). Interestingly, in some of the most centrally located areas of the city, where facilities for medical care for the poor are limited, the number of emergency room patients in hospitals serving these areas (Maryland General, Provident, and Mercy) has scarcely increased at all, while the number of patients in two hospitals (South Baltimore, and Franklin Square) has actually decreased over the seven-year period of study.

TABLE 1: Annual Emergency Room Visits, All Baltimore Hospitals * (1960-1967)

	1960	1961	1962	1963	1964	1965	1966	1967

** The Hospital Council of Maryland, Inc. Annual Statistical Reports: 1960-1967*

In sharp contrast, however, is the situation in the emergency service of Bon Secours Hospital, located in the very "inner core" of west Baltimore. Here the number of emergency room patients has climbed from 5,600 in 1960 to over 23,000 in 1967, a percentage gain of over 450% or 65% per year. Although 11 other Baltimore hospitals have a greater annual number of patients, the growth rate for Bon Secours is the fastest for not only all hospitals in the city of Baltimore, but for the entire state of Maryland as well.[3] In other words, the growth rate of the emergency service at Bon Secours is five to six times the national rate, as calculated by the United States Public Health Service.[1] An annual patient count of well over 50,000 is expected by 1972.

However, two hospitals that now care for 195,000 people in west Baltimore, (Franklin Square and Provident), will soon be torn down and moved to the suburbs. Presumably, the emergency room at Bon Secours, 'The Hospital That Elected To Stay', will inherit an additional 26,000 patients, those now being treated by these two other hospitals. If this does occur, the annual patient load at Bon Secours' emergency room could reach 75,000 by 1972.

To effectively meet the needs of the growing number of outpatients, it is necesasry to understand the services and equipment available to deal with the problem, as well as the characteristics of the population being served by such care. To accomplish this, two analyses of current emergency room activities at Bon Secours were made. The first is presented in this article.

Materials and Methods

The Bon Secours Hospital is a completely accredited, full service general hospital for adults and children. It is a privately owned hospital for short-term patients, under the auspices of the Sisters of Bon Secours. The hospital opened in 1919 and a new addition was built in 1954. The hospital contains 254 beds with a newborn nursery of 48 beds. It is located in west Baltimore and has a fairly constant inpatient service averaging 9,200 admissions per year.

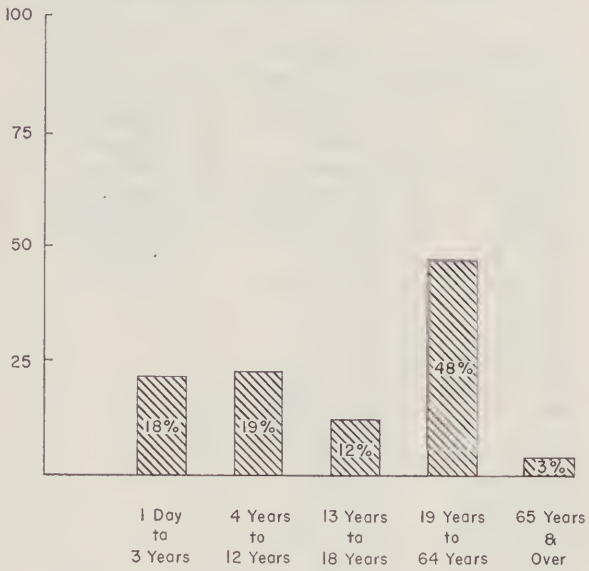
The present emergency room, containing six stretchers and three treatment rooms, is fully equipped to handle all medical, surgical, obstetrical, and pediatric emergencies. Part of the new $7 million building program includes a more modern up-to-date emergency room, planned for occupancy in 1972.

Prior to 1967, the emergency room was completely staffed by the hospital's interns and residents; ie, one intern served in the emergency room each month, with the resident staff on call for consultation. Because of an increasing patient load, this system proved inadequate. So, in October, 1967, the hospital obtained a group of five licensed physicians to provide continual medical care in the emergency room, seven days a week. These physicians, all general surgeons, have formed a partnership and are contracted by the hospital to carry on a group practice within the emergency room as independent contractors, on a fee-for-service basis. In April, 1969, the medical staff of Bon Secours gave the emergency room departmental status, with representation on the hospital executive committee.

This study covered 1,043 patient visits to the emergency service over a two-week period (September 22 to October 5, 1968). Excluded from the study were patient visits for circulation cast checks, prescription refills, Tine and other test readings, routine injections requested by the clinic to be given on weekends, etc. Repeat (follow-up) visits are not allowed in the emergency room; none were recorded.

Included in this study are data obtained from the standard Emergency Service Record Form, consisting of information on the patient's age, sex, race, time of arrival to the emergency room, classification of the complaint, family physician, diagnosis (impression) as recorded by the physician on duty, and the source of payment for emergency services rendered. Finally, a list of minor procedures performed on these patients during the two-week period is presented.

Since many of the demographic and other socioeconomic characteristics of the above patient population were not recorded on the Emergency Service Record Form, supplementary patient interviews using detailed questionnaires are being considered for future studies. Data from these interview/questionnaires will be tabulated and transferred to standard IBM cards for analysis.



Results of the Study Analysis of the Patients

Sex: Of the 1,043 patients visiting the emergency room during the two-week period of study, 490 were men, 553 were women. A standard statistical deviation of error can partially account for the larger percentage of women in the outpatient facility. In addition, 36 of the women were pregnant and 18 of them had cases of acute salpingitis, mostly venereal in origin. Men with venereal disease were most frequently referred to other health clinics in the city, and were not registered at the emergency room desk.

Race: Three hundred forty-nine (33.5%) of the patients visiting the emergency room were white, 694 (66.5%) were Negro.

Age: Figure 1 shows the patient sample by age groups. Eighteen percent (184) of the patients were from one day to three years old, while 19% (195) were from four to 12 years of age. The total number of pediatric patients in the sample group was 379, or 37%. In the adolescent age group, (13 to 18), there were 128 patients, representing 12% of the sample. Most of the patients were adults between the ages 19 and 64 (504 or 48%). Only three percent of all patients were over the age of 65.

Fig. 1: Patient Sample by Age Groups

Time of Arrival at the Emergency Room: Eleven per cent (117) of the patients arrived between 12 AM and 8 AM. Forty per cent (418) arrived between 8 AM and 4 PM, and the remaining 49% (508 patients) arrived between 4 PM and 12 AM.

Family physician: Meaningful statistics on the number of patients having family physicians were difficult to obtain. Some patients denied having a personal physician, when in fact they may have had several. On the other hand, many patients gave the names of physicians who were either deceased, had long since been out of practice, or were completely inaccessible to the patient. Nevertheless, 381 (36%) patients stated that they did have a family physician and 592 (57%) did not have one. Probably 75% to 80% of the patients had no real patient-physician relationship. There are two possible explanations: A large number of the people visiting the facility are poor; and, many of the family physicians have moved their practices away from the Bon Secours area in recent years.

Conditions Treated in the Emergency Room

Table 3 lists the conditions that were treated in the emergency room. Of the 1,043 patients that were admitted, 505 (49%) had surgical conditions, 249 (24%) had medical conditions, and of the remaining

289 (27%), 114 (11%) had gynecological and obstetrical problems; 79 (7%) otorhinolarynological; 66 (6%) neurological and psychiatrical; and 30 (3%) had dermatological conditions. Since this study was undertaken in early fall, numerous patients suffering from upper respiratory infections were observed. In fact, if the number of these cases, 76, is combined with the cases of tonsillitis (48), pharyngitis (14), and otitis (9) seen, it can be calculated that these diseases constituted approximately 14% of the total number of diagnoses made for the entire patient sample. Most of these conditions, with the exception of the gynecological and obstetrical cases, occurred in the pediatric patients.

TABLE 3: Primary Diagnoses Recorded for 1,043 Admissions to the Emergency Room September 22-October 5, 1968 (14 days)

Surgical: 505		Medical: 249		Gyn. & Ob.: 114		Neuro. & Psych.: 66		E.N.T.: 79		Dermatological: 30

Table 4 lists the numbers and types of minor procedures performed on the patient sample during the two-week period. Of the 95 recorded lacerations, only 77 required suturing. In addition, 24 fractures were treated.

TABLE 4: Minor Procedures Performed on 1,043 Patients Admitted to the ER

Type of Procedure	Numbers
Suturing of Laceration	77
Incision & Drainage of Abscess	17
Reduction of Fracture (Closed)	8
Application of Plaster Cast	13
Excision of Foreign Body	11
Debridement of Wound	21
Reduction of Dislocation	1
X-ray Examinations	211

Classification of the Conditions Treated

A study of the degree of urgency of the patient's condition, as evaluated by the physician on duty revealed: Conditions of 52 patients (5%) were considered extremely urgent; those of 417 (40%) were evaluated as emergent; and 574 (55%) were considered nonemergent.

Extremely urgent conditions are those that demand immediate attention, ie, gross hemorrhage, acute poisoning, cardiac emergencies, respiratory distress, etc. In such conditions in children under age, the law waivers the need for immediate parental consent, and imposes a definite obligation on the part of the physician to begin treatment without delay. Emergent conditions, while not life-threatening, require immediate treatment to avoid inevitable disability or irreversible consequences. Most, but certainly not all, are surgical in nature; many require immediate hospitalization. Nonemergent conditions are treated only because other health facilities are not available at the time, and in the opinion of the examining physician, require only limited therapy.

Post Emergency Room Referral

After receiving emergency care. Sixty percent (624) of the patients in this study were referred to an appropriate outpatient department clinic at Bon Secours, mostly by direct appointments. Thirty-two percent (332) of the patients were referred back to their recorded family physician, while 5% (56) of

the patients were admitted directly to the hospital. Thus, from a total of 9,200 annual in-service hospital admissions, 15% of these admissions came directly from the emergency service. Another 2% of the (25) patients were entitled to workman's compensation benefits. Four patients were transferred to other hospitals. Two patients died in the emergency room, both from cardiac arrest.

Sources of Payment for Emergency Room Service

Twenty-four percent (256) of the patients stated that they had some form of Blue Cross or Blue Shield medical insurance coverage, or both. Possibly as high as 4% of the claims forms submitted, however, were rejected: either the policy had expired or the medical condition was not covered by the particular policy in question. Furthermore, since Blue Shield insurance claims for emergency room service are valid only if the medical condition is traumatic in origin and did not exist 72 hours before treatment was sought, only approximately 10% to 12% of the entire patient sample received payment help from Blue Shield, Inc. Thirty-three percent (343) were Welfare patients entitled to full or partial medical assistance payments and 14% (142) were covered by a variety of private medical insurance policies. Two percent (17) of the patients were entitled to Medicare benefits. Twenty-two percent (225) patients had no third-party payment resources; hence, they were categorized as "cash" patients.

Conclusions

From this study, certain facts emerge. First of all, the Bon Secours Hospital emergency service is rapidly assuming a dominant role in the ambulatory health needs of west Baltimore. In addition, its function as an "accident ward" is being more and more overshadowed, and somewhat interfered with, by its use as a 24 hour-a-day "walk-in" clinic. Finally, its location within the "inner core" of the city, with its large proportion of indigent patients, is creating a considerable financial strain on the hospital.

Although a new, greatly enlarged emergency room is already being planned, it will not be completed before 1972. The number of patients is rapidly increasing, and the existing facilities may become completely inadequate long before this time.

It is certainly not too early to begin preparing for such an eventuality; other health facilities must share this patient load. With so many nonemergent patients being admitted, a closer working relationship between the emergency room and the outpatient department clinics must be established. An evening and week-end medical/pediatric outpatient service has been suggested for clinics and this step alone would relieve much of the congestion in the emergency room during these times.

Summary

1. **An in-depth analysis of the Emergency Department of Bon Secours Hospital has been undertaken.**
2. **A statistical survey of the number of patients in the emergency rooms of 22 Baltimore hospitals is presented, along with a comparative growth rate of Bon Secours.**
3. **A sample of 1,043 patients admitted to the emergency service at Bon Secours over a two-week period is analyzed for the following information: the patient's sex, race, age, time of arrival in the emergency room, family physician, diagnosis, classification of the complaint, post emergency room referral, and source of payment for services rendered.**
4. **A need for closer working arrangements with other health facilities, such as the outpatient department clinics, is established.**

"All that Bon Secours has done will be multiplied by what it now will do."

—Sister Theopane, CBS

your medical faculty at work

by John Sargeant
Executive Secretary

The House of Delegates in Semiannual Session met at Hershey, Pa., on Friday, September 5, 1969, and took the following action:

1. Adopted minutes of the April 9 and April 11, 1969, House of Delegates meetings;
2. Elected the following to Emeritus Membership on recommendation of the Council and the Baltimore City Medical Society:

   Jerome J. Blumberg, MD
   Warfield M. Firor, MD
   R. Carmichael Tilghman, MD

3. Elected to Honorary Membership in the Faculty, on the recommendation of the Executive Committee:

   William B. Kouwenhoven, Dr. Ingr., MD (Hon)

4. Adopted the following Standing Rule of the House:

   "A Committee chairman or the reporting member of a committee who is not a member of the House of Delegates shall have the privilege of making motions and speaking in debate in connection with the report of such committee. Others who are not members of the House of Delegates may, by a three-fourths vote, be extended the privilege of making a verbal report to the House for a time not to exceed five minutes. They may, by majority vote, be allowed to revise and extend their report for publication in the Transactions issue of the *Maryland State Medical Journal.*"

5. Adopted resolutions honoring the memory of **John M. T. Finney, Jr., MD,** Baltimore, and **Bernard O. Thomas, Sr., MD,** Frederick;
6. Accepted the Auditor's Statement for 1968;
7. Adopted various Bylaw amendments;
8. Received various Information Committee Reports.

The Executive Committee and Council in sessions held at Hershey, Pa., on Thursday, September 4, 1969, took the following actions:

Executive Committee:

1. Received and agreed to submit names for consideration of the United States Pharmacopeial Nominating Committee;
2. Approved recommendation of **Kurt Raab, MD,** Baltimore, for appointment to the Medical Advisory Board, Department of Motor Vehicles;
3. Approved a questionnaire to be used in conducting a survey on Physician Attitudes toward Nurse-Midwives with the understanding that this was not necessarily approving the conclusions reached from the survey. It is also to be understood that the results would be made available to the Faculty prior to their publication;
4. Declined to provide information as to what would be the appropriate fee per hour or per two-hour session for work of physicians in a chest clinic;
5. Authorized expenditure of staff time and underwriting other expenses in connection with a state-wide study of perinatal deaths;

6. Endorsed the project, Evaluation of Nutritional Status of Preschool Children in the U.S., as proposed by the Children's Hospital Research Foundation, Cleveland, Ohio, provided it conforms with all Maryland laws;
7. Authorized sale of two Persian rugs owned by the Faculty;
8. Redesignated the position occupied by **Mr. Joseph J. Harrison, CPA,** as Comptroller;
9. Authorized transfer of 750 shares of Elkton Bank and Trust Company from the present trustee name, All & Co., to the name of the Faculty; so as to obviate the necessity of income from this source flowing through the Trustee at a percentage cost to the Faculty;
10. Approved the Rubella Immunization Drive, with the understanding that this would be conducted as have previous similar drives, with children obtaining vaccination from private physicians, as much as possible, and those unable to obtain them through this source to be immunized in the drive through the school system;
11. Declined to approve use of the Community Health Project Fund (surplus funds from the Measles Immunization Drive) as these funds have been already committed to the Preschool Hearing and Vision Screening program; and because such use would effectively dissipate the money which it is planned to use as "seed" money for self-supporting projects;
12. Rereferred to the Medical Economics Committee for further study and report. a decision rendered in a case dealing with Usual, Customary and Reasonable Charges;
13. Designated the Subcommittee on Child Welfare as the responsible group in the Faculty to work with the Maryland Committee for Children and Youth; and agreed to inform Faculty membership of the objectives of this group, at the same time endorsing such objectives.

The Council:

1. Deferred action, until the November Council meeting, on a recommendation of the Professional Medical Services Committee, and on appointment of legal counsel for the 1970 year;
2. Adopted the following motion:

   "The Medical and Chirurgical Faculty recognizes the critical need for additional hospital facilities in Charles County and supports and endorses the efforts of the Charles County Medical Society in this regard."
3. Agreed to investigate the activities of an individual in Cumberland, Md., who has been allegedly calling herself a "cancer specialist."

The Commission on Medical Discipline is adopting Rules of Procedure which shall apply to all formal hearings before the Commission. Details may be obtained from the Commission office: 1211 Cathedral St., Baltimore, Maryland 21201.

Doctors Take Note . . . *(Continued from page 6)*

NOVEMBER 7, 1969
NEW YORK STATE ACTION FOR CLEAN AIR COMMITTEE

7th Annual Meeting: Cooper Union, 51 Astor Place, Manhattan. A panel discussion of education and training in the field of environmental health will highlight the session. The meeting is open to the public. Contact: State Committee, 105 E. 22nd Street, New York, New York 10010.

NOVEMBER 7, 1969
MARYLAND INDUSTRIAL MEDICAL ASSOCIATION/THE NATIONAL CAPITAL OCCUPATIONAL MEDICAL ASSOCIATION

Joint Meeting: Holiday Inn Downtown, 301 West Lombard Street, Baltimore, Md. The meeting will consist of a clinical session, social hour, and group dinner. For information, contact: Samuel L. Fox, MD, 1205 St. Paul St., Baltimore, Md. 21202.

NOVEMBER 10, 1969
AMERICAN COLLEGE OF CHEST PHYSICIANS

Annual Scientific Session of the Southern Chapter: Regency Hyatt House, Atlanta, Georgia. An interdisciplinary faculty will provide basic information on the principles of circulation and respiration, and the application of this information to patient care. Contact: Bradford W. Claxton, American College of Chest Physicians, 112 E. Chestnut St., Chicago, Ill. 60611.

NOVEMBER 10-14, 1969
NEW YORK UNIVERSITY SCHOOL OF MEDICINE/AMERICAN ASSOCIATION OF INDUSTRIAL NURSES

Five-day Course in Occupational Health for registered professional nurses in industry: New York University School of Medicine. Tuition—$175. Subjects include: the objectives and scope of an occupational health program; the relationship between doctor and nurse, employer and employee, and the management and the medical department; emphasis on interviewing and counselling; environmental hazards; retirement and the problems of older workers; and the legal aspects of medicine and nursing. Send applications to: Course #484, Office of the Recorder, New York University Postgraduate Medical School, 550 First Ave., New York, N.Y. 10016.

NOVEMBER 10-14, 1969
THE DEPARTMENT OF OBSTETRICS AND GYNECOLOGY, THE COLLEGE OF PHYSICIANS AND SURGEONS, COLUMBIA UNIVERSITY

Postgraduate Course in Obstetrics and Gynecology: Columbia University, New York. The course will include a refresher course in obstetric and gynecologic pathology in addition to presenting a survey of the major clinical and pathological problems of the female reproductive system. Contact: Melvin D. Yahr, MD, Associate Dean, College of Physicians and Surgeons, 630 West 168th St., New York, New York 10032.

NOVEMBER 11-14, 1969
NEW YORK UNIVERSITY MEDICAL CENTER/DEPARTMENT OF REHABILITATION MEDICINE

Full-time Course—Clinical Electrodiagnosis of Neuromuscular Diseases: Institute of Rehabilitation Medicine Research Pavillon, New York University Medical Center, 400 E. 34th Street, New York, New York 10016. For further information, contact Joseph Goodgold, MD, at the same address.

NOVEMBER 12-15, 1969
MOUND PARK HOSPITAL FOUNDATION, INC./THE UNIVERSITY OF FLORIDA COLLEGE OF MEDICINE

Postgraduate Seminar—Today's Hospital Problems: An Interdisciplinary Approach: Tides Hotel and Bath Club, Redington Beach, Florida. A $100 tuition fee must accompany each application. This program is acceptable for 20 prescribed hours by the American Academy of General Practice. For additional information, contact: M. A. Barton, MD, Director of Postgraduate Medical Education, Mound Park Hospital Foundation, St. Petersburg, Florida 33701.

NOVEMBER 13-14, 1969
THE DEPARTMENT OF GYNECOLOGY AND OBSTETRICS, WAYNE STATE UNIVERSITY SCHOOL OF MEDICINE/HARPER HOSPITAL

Symposium—Pathways of Conception—The Role of the Cervix and the Oviduct in Reproduction: Rackham Memorial Building, Detroit, Mich. The program also includes a panel discussion on "Test Tube Babies—Fact or Fancy." Contact: Alfred I. Sherman, MD, Program Chairman, Gynecology and Obstetrics, Wayne State University School of Medicine, 432 East Hancock, Detroit, Mich. 48201.

NOVEMBER 13-15, 1969
THE AMERICAN FOUNDATION OF RELIGION AND PSYCHIATRY

Convocation—The Revolution in Values—The Response of the Healer: Statler Hilton Hotel, New York City. Chairman: Hobart Lewis, President and Executive Editor of the *Reader's Digest*. Contact: Hobart Lewis, Chairman, International Convocation, 3 West 29th Street, New York, New York 10001.

NOVEMBER 13-18, 1969
AMERICAN HEART ASSOCIATION

Annual Meeting—American Heart Association: Dallas, Texas. For further information, contact: Heart Association of Maryland, 415 North Charles St., Baltimore, Maryland 21201.

NOVEMBER 14, 1969
THE CHILDREN'S MEDICAL AND SURGICAL CENTER OF THE JOHNS HOPKINS INSTITUTIONS

Conference—Clinical Advances in Pediatrics. Practical aspects of patient care will be stressed, such as, management of jaundice in the newborn; diagnosis and treatment of anemia in childhood, and use versus abuse of antibiotics in pediatrics. The program is acceptable for 10 prescribed hours by the AAGP. For additional information, contact: Matthew Debuskey, MD, The Johns Hopkins Hospital, 601 N. Broadway, Baltimore, Maryland 21205.

NOVEMBER 14-15, 1969
NEW YORK CITY DIVISION OF THE AMERICAN CANCER SOCIETY/THE ACOG COMMITTEE ON CONTINUING EDUCATION OF GENERAL PRACTITIONERS/THE NEW YORK MEDICAL COLLEGE

Postgraduate Symposium in Gynecologic Oncology: New York Medical College. There is no registration fee. Contact: Sanford Sall, MD, Director, Gynecologic Malignancy Service, New York Medical College, 1249 Fifth Avenue, New York, New York 10029.

NOVEMBER 16-19, 1969
ASSOCIATION OF MILITARY SURGEONS OF THE UNITED STATES

Annual Meeting: Sheraton-Park Hotel, Washington, D.C. Keynote Speaker: Gerald D. Dorman, MD, President of the American Medical Association. For further information, contact: Brig. Gen. James A. Wier, MC, USA, General Chairman, Association of Military Surgeons of the United States, 1500 Massachusetts Ave., NW, Washington, D.C. 20005.

NOVEMBER 16-20, 1969
AMERICAN ASSOCIATION OF BLOOD BANKS

Annual Meeting: Shamrock Hilton Hotel, Houston, Texas. Principal Speaker: Denton A. Cooley, MD. The program will include papers on advances in the use of platelets, frozen blood, the discovery of new blood sub-types, use of adenine in blood preservation, and a symposium on antigen-antibody reactions. For further information, contact: Frank C. Coleman, MD, President, American Association of Blood Banks, Suite 1322, 30 North Michigan Avenue, Chicago, Illinois 60602.

NOVEMBER 20-22, 1969
TEXAS HEART ASSOCIATION/AMERICAN HEART ASSOCIATION

Special Scientific Session: Mexico City. For further information, contact: Heart Association of Maryland, 415 North Charles St., Baltimore, Maryland 21201.

NOVEMBER 17-21, 1969
WORLD FEDERATION OF MENTAL HEALTH/NATIONAL ASSOCIATION FOR MENTAL HEALTH

World Mental Health Assembly: Shorcham Hotel, Washington, D.C. For further information, contact: Paul V. Lemkau, MD, Chairman, 615 North Wolfe St., Baltimore, Maryland 21205.

NOVEMBER 30, 1969
INTERNATIONAL COLLEGE OF SURGEONS/INTERNATIONAL SURGERY

Journalism award for the best scientific paper submitted by a surgical resident. A $500.00 cash award is being made available through a grant from Carroll J. Bellis, MD, a Fellow of the International College of Surgeons. For further information, write: Surgical Resident Award Program, International Surgery, 1516 N. Lake Shore Drive, Chicago, Ill. 60610.

NOVEMBER 30-DECEMBER 3, 1969
THE AMERICAN MEDICAL ASSOCIATION

Clinical Convention: Convention Center Complex, Denver, Colorado. The convention will include scientific sessions and the showing of 25 medical motion pictures. Write: The American Medical Association, 535 North Dearborn St., Chicago, Ill. 60610.

DECEMBER 3, 1969
MARYLAND KIDNEY FOUNDATION

Seminar—Dialyzable Poisons: University of Maryland Hospital, Psychiatric Institute, Room 1-704, Baltimore, Md. Speaker: John F. Maher, MD, Professor of Medicine, Director, Division of Nephrology, University of Missouri School of Medicine. The seminar will begin at 5:00 PM.

UNITED FUND Now a Reality

The need for a consolidation of major fund drives in the Central Maryland area has long been apparent. The competition for top leadership among the various appeals put an undue burden on businessmen and their executive personnel. The public was bombarded with requests for donations, and even the housewife was met so often with an outstretched hand that many eventually refused to answer the urgent ringing of their doorbell.

In July, 1967, a resolution passed by the Chamber of Commerce stated that "the Directors of the Chamber of Commerce of Metropolitan Baltimore approve in principle the consolidation, at the earliest practical date, of all major charitable fund-raising drives into one annual campaign; and the Directors urge representatives of all Baltimore area fund appeals to work aggressively towards an early consolidation."

In October, 1967, representatives of the United Community Funds and Councils of America met with Frederick L. Wehr, of the Monumental Life Insurance Company, and Chairman of the Joint Fund Committee of the United Appeal, and the groundwork was laid.

The months that followed saw many meetings with representatives of the major fund drives, and with business and professional men from all fields. Early in the planning stages, representatives of labor were brought into the planning, and the concept of a United Fund was enthusiastically endorsed by all segments of the labor movement.

After uncounted man-hours and meetings involving the major fund-raising organizations and most of the top civic leaders from the fields of business and labor, a committee headed by Harry B. Cummings, recently retired Vice President and General Manager of the Metals Products Division of the Koppers Company, was organized to plan and implement steps necessary to the formation of a United Fund to be governed by the citizens of the Central Maryland Area.

The committee members Mr. Cummings and Herbert G. Bailey, Jr., Irving Blum, Harper R. Clark, Owen Daly, II, Alonzo G. Decker, Jr., Arthur G. Foster, Albert D. Hutzler, Jr., Henry J. Knott, John A. Luetkemeyer, Harry L. Lippincott, Nicholas F. Mueller, J. Stevenson Peck, Austin E. Penn, Nicholas V. Petrou are represented by Harry W. Smith, Sr., L. Mercer Smith, W. G. Smith, Walter Sondheim, Jr., Frederick L. Wehr. They realized it is not enough to try to rebuild a city with stone and cement, but that the health, happiness and well-being of the individual citizen is an even more important part of that rebuilding.

They realized, too, that those voluntary agencies supported by public donations are the most important weapon in the fight against pain and misery, for it is through these agencies that the sick and injured are given care and rehabilitation, the disturbed find peace, the troubled find help, that families, the basis of our society, are counseled and remain as firm, strong units, that children are cared for and given guidance onto the right paths, that the older citizens of our community find care and companionship.

The task was monumental. Funds had to be raised to continue to meet these needs, and still not overburden the public that had been called upon to support them.

After months of consultation and discussion, plans were drawn, a charter devised, and by-laws written that place in the hands of the public the management of its own fund-raising campaign.

Under the provisions of the United Fund, businesses and individuals will be called upon only one time each year to donate to those agencies that are considered necessary for the well-being of the entire community.

All charitable groups are invited to join this long-needed revision in fund-raising policies in the Central Maryland area to alleviate the unnecessary burden placed on the giving public by multiplicity of appeals and still maintain those services vitally necessary to the continued health and growth of the area.

THIRD ANNUAL SEMINAR

ON THE MEDICAL ASPECTS OF SPORTS

Saturday, December 6, 1969 — 9:00 AM to 4:30 PM

Catonsville Community College,
800 South Rolling Road, Catonsville

9:00 AM Registration

10:00 AM Opening Remarks

10:15 AM Room A—**Reflection on the 1968 Olympics Conducted at High Altitude**
Thomas F. Waddell, MD
Georgetown University Hospital
Washington, D.C.

Room B—**Physical Medicine in Athletic Rehabilitation**
Alvin M. Brown, MD
Medical Director
Atlanta Southside Comprehensive Health Center
Atlanta, Georgia

11:30 AM Room A—**Conditioning of the Athlete**
Mr. James Kehoe
Director of Athletics
University of Maryland
College Park, Maryland

Room B—**Neurological Injuries—Field Diagnosis, and Transportation**
Charles W. Henderson, MD
Baltimore, Maryland

12:15 PM Lunch—May be purchased on the campus

1:30 PM Room A—**The Role of "Drugs" in Athletics**
William J. Kinnard, Jr., PhD
Dean and Professor of Pharmacology
University of Maryland
School of Pharmacy
Baltimore, Maryland

Room B—**Athletic Competition for Women and Teen-Age Girls**
(speaker to be announced)

2:45 PM Room A—**Psychosomatic Problems in the Athlete**
Burris Huesman, PhD
College of Physical Education
University of Maryland
College Park, Maryland

Room B—**Medicolegal Responsibility for the Athlete by School Administrator, Team Physician, and Coach**
Betty VanderSmissen, PhD
Penn State University
State College, Pennsylvania

3:30 PM Taping Clinics—Conducted on an informal basis so instruction can be more individualized

4:30 PM Adjournment

Program is sponsored by the Medical and Chirurgical Faculty of the State of Maryland and the Division of Health, Physical Education, and Recreation of Catonsville Community College.

3rd Annual Seminar on the Medical Aspects of Sports, December 6, 1969

symptoms of mixed anxiety-depression are rarely clear-cut...
but they are often a clear indication for

Mellaril®
(thioridazine)
25 mg. t.i.d.

effective in mixed anxiety-depression and in moderate to severe anxiety

Before prescribing or administering, see Sandoz literature for full product information, including adverse reactions reported with phenothiazines. The following is a brief precautionary statement.

Contraindications: Severe central nervous system depression, comatose states from any cause, hypertensive or hypotensive heart disease of extreme degree.

Warnings: Administer cautiously to patients who have previously exhibited a hypersensitivity reaction (e.g., blood dyscrasias, jaundice) to phenothiazines. Phenothiazines are capable of potentiating central nervous system depressants (e.g., anesthetics, opiates, alcohol, etc.) as well as atropine and phosphorus insecticides. During pregnancy, administer only when necessary.

Precautions: There have been infrequent reports of leukopenia and/or agranulocytosis and convulsive seizures. In epileptic patients, anticonvulsant medication should also be maintained. Pigmentary retinopathy may be avoided by remaining within the recommended limits of dosage. Administer cautiously to patients participating in activities requiring complete mental alertness (e.g., driving). Orthostatic hypotension is more common in females than in males. Do not use epinephrine in treating drug-induced hypotension. Daily doses in excess of 300 mg. should be used only in severe neuropsychiatric conditions.

Adverse Reactions: *Central Nervous System*—Drowsiness, especially with large doses, early in treatment; infrequently, pseudoparkinsonism and other extrapyramidal symptoms; nocturnal confusion, hyperactivity, lethargy, psychotic reactions, restlessness, and headache. *Autonomic Nervous System*—Dryness of mouth, blurred vision, constipation, nausea, vomiting, diarrhea, nasal stuffiness, and pallor. *Endocrine System*—Galactorrhea, breast engorgement, amenorrhea, inhibition of ejaculation, and peripheral edema. *Skin*—Dermatitis and skin eruptions of the urticarial type, photosensitivity. *Cardiovascular System*—Changes in the terminal portion of the electrocardiogram have been observed in some patients receiving the phenothiazine tranquilizers, including Mellaril (thioridazine). While there is no evidence at present that these changes are in any way precursors of any significant disturbance of cardiac rhythm, several sudden and unexpected deaths apparently due to cardiac arrest have occurred in patients previously showing electrocardiographic changes. The use of periodic electrocardiograms has been proposed but would appear to be of questionable value as a predictive device. *Other*—A single case described as parotid swelling.

SANDOZ PHARMACEUTICALS, HANOVER, N.J. SANDOZ 69-384

Mild ulcerative colitis may be triggered here...

In mild ulcerative colitis, a number of factors can precipitate an attack: for instance, dietary indiscretion, such as eating raw foods, or emotional overreaction, such as that aroused by financial difficulties. No matter what causes the patient's sensitive colon to "act up," he soon suffers from acute discomfort...and often, from anxiety and apprehension as well. Such patients frequently respond well to adjunctive dual-action Librax® therapy.

Librax combines, in a single convenient capsule, the well-known antianxiety effect of Librium® (chlordiazepoxide HCl) and the dependable anticholinergic /antispasmodic effect of Quarzan® (clidinium Br). Therefore, as Librax helps to relieve the patient's excessive anxiety and reduce his overreaction to stress, it also, at the same time, helps to control hypersecretion and hypermotility, thus relieving spasm and abdominal discomfort.

With Librax, the dosage schedule is simple: 1 or 2 capsules, t.i.d. or q.i.d., will in most cases bring the patient significant relief of both the emotional and physical elements that contribute to his psychovisceral disorder.

Before prescribing, please consult complete product information, a summary of which follows.

INDICATIONS: Indicated as adjunctive therapy to control emotional and somatic factors in gastrointestinal disorders.

CONTRAINDICATIONS: Patients with glaucoma; prostatic hypertrophy and benign bladder neck obstruction; known hypersensitivity to chlordiazepoxide HCl and/or clidinium bromide.

WARNINGS: Caution patients about possible combined effects with alcohol and other CN depressants. As with all CNS-acting drugs, ca tion patients against hazardous occupations quiring complete mental alertness (*e.g.*, operati machinery, driving). Though physical and ps chological dependence have rarely been report on recommended doses, use caution in a ministering Librium (chlordiazepoxide hydr chloride) to known addiction-prone individu or those who might increase dosage; withdraw symptoms (including convulsions), followi discontinuation of the drug and similar to tho seen with barbiturates, have been reported. U of any drug in pregnancy, lactation, or in wom of childbearing age requires that its potenti benefits be weighed against its possible hazar As with all anticholinergic drugs, an inhibiti effect on lactation may occur.

PRECAUTIONS: In elderly and debilitate limit dosage to smallest effective amount to pr clude development of ataxia, oversedation confusion (not more than two capsules per d initially; increase gradually as needed and tole

or here.

ed). Though generally not recommended, if mbination therapy with other psychotropics ems indicated, carefully consider individual harmacologic effects, particularly in use of po- ntiating drugs such as MAO inhibitors and henothiazines. Observe usual precautions in resence of impaired renal or hepatic function. aradoxical reactions (*e.g.*, excitement, stimula- n and acute rage) have been reported in psy- iatric patients. Employ usual precautions in eatment of anxiety states with evidence of im- nding depression; suicidal tendencies may be esent and protective measures necessary. Vari- le effects on blood coagulation have been ported very rarely in patients receiving the ug and oral anticoagulants; causal relation- ip has not been established clinically.

ADVERSE REACTIONS: No side effects or anifestations not seen with either compound ne have been reported with Librax. When lordiazepoxide hydrochloride is used alone, owsiness, ataxia and confusion may occur, pecially in the elderly and debilitated. These are reversible in most instances by proper dosage adjustment, but are also occasionally observed at the lower dosage ranges. In a few instances syncope has been reported. Also encountered are isolated instances of skin eruptions, edema, minor menstrual irregularities, nausea and constipation, extrapyramidal symptoms, increased and decreased libido—all infrequent and generally controlled with dosage reduction; changes in EEG patterns (low-voltage fast activity) may appear during and after treatment; blood dyscrasias (including agranulocytosis), jaundice and hepatic dysfunction have been reported occasionally with chlordiazepoxide hydrochloride, making periodic blood counts and liver-function tests advisable during protracted therapy. Adverse effects reported with Librax are typical of anticholinergic agents, *i.e.*, dryness of mouth, blurring of vision, urinary hesitancy and constipation. Constipation has occurred most often when Librax therapy is combined with other spasmolytics and/or low residue diet.

two good reasons for prescribing LIBRAX®

Each capsule contains 5 mg chlordiazepoxide HCl and 2.5 mg clidinium Br.

ROCHE
LABORATORIES
Division of Hoffmann-La Roche Inc.
Nutley, New Jersey 07110

heavenly relief
for unearthly cough

Benylin®
EXPECTORANT

Each fluidounce contains: 80 mg. Benadryl® (diphenhydramine hydrochloride, Parke-Davis); 12 grains ammonium chloride; 5 grains sodium citrate; 2 grains chloroform; 1/10 grain menthol; and 5% alcohol.

An antitussive and expectorant for control of coughs due to colds or of allergic origin, BENYLIN EXPECTORANT is the leading cough preparation of its kind. BENYLIN EXPECTORANT tends to inhibit cough reflex... soothes irritated throat membranes. And its not-too-sweet, pleasant raspberry flavor makes BENYLIN EXPECTORANT easy to take.

PRECAUTIONS: Persons who have become drowsy on this or other antihistamine-containing drugs, or whose tolerance is not known, should not drive vehicles or engage in other activities requiring keen response while using this preparation. Hypnotics, sedatives, or tranquilizers if used with BENYLIN EXPECTORANT should be prescribed with caution because of possible additive effect. Diphenhydramine has an atropine-like action which should be considered when prescribing BENYLIN EXPECTORANT.

ADVERSE REACTIONS: Side reactions may affect the nervous, gastrointestinal, and cardiovascular systems. Drowsiness, dizziness, dryness of the mouth, nausea, nervousness, palpitation, and blurring of vision have been reported. Allergic reactions may occur.

PACKAGING: Bottles of 4 oz., 16 oz., and 1 gal.

ARTHUR E. COCCO, MD
Journal Representative

Baltimore City Medical Society

Meeting Minutes

Ten members of the Board of Directors of the Baltimore City Medical Society met on September 2, 1969 at 4:30 PM at 1211 Cathedral Street, Baltimore, Maryland. The meeting was called to order by the President, Raymond C. V. Robinson, MD.

The minutes of the June 3rd meeting of the Board were approved.

The first item on the agenda was related to the forthcoming meeting of the House of Delegates of the Medical and Chirurgical Faculty. After a brief discussion of the items on the agenda, the Board met with the delegates and their alternates, as is the policy of the Baltimore City Medical Society.

The next item on the agenda was the report of the Finance Committee submitted by Emmanuel A. Schimunek, MD, D. Frank Kaltreider, MD, and Philip F. Wagley, MD. The present assets of the Society are as follows:

Savings Bank of Baltimore	$15,000.00
American Telephone & Telegraph (Bonds)	1,872.94
National Cash Register Company (Bonds)	2,017.51
International Harvester Co. (Bonds)	2,078.16
General Motors Acceptance (Bonds)	1,955.44
Consolidated Edison (Bonds)	2,020.44
Massachusetts Investors Growth Stock Fund	16,990.12
T. Rowe Price Growth Stock Fund	20,243.50
Mercantile-Safe Deposit & Trust (Checking Acct)	16,704.06
Total	$78,882.17

The estimated expenses of the Society per year are $33,000: $26,000 is paid to the Medical and Chirurgical Faculty for Rent and Services and the additional $7,000 is used for general office expenses.

The following recommendations made by the Finance Committee were approved by the Board:

1. A Finance Committee consisting of three members and the treasurer as an ex-officio member should be appointed each year. This Committee should meet the first week in January to decide what should be done with any excess fund of the Society. To ensure continuity only one member of the Committee should be replaced each year and should be appointed from the current membership of the Board.
2. All bonds presently held by the Society should be sold and the funds realized from such sale should be invested in T. Rowe Price Growth Stock Fund, Inc.
3. The present savings account of $15,000 should be converted to a 5% account.
4. Additional savings accounts should be opened by the Society in which all dues and interest should be placed. The balance in the Society's checking account should be kept at $7,000 and all other cash should be placed in the savings accounts. A total of $33,000 should be kept in savings accounts and the checking account at the end of each year to cover the Society's op-

erating expenses. Whenever a savings account reaches $15,000, the treasurer should be notified so that an additional account can be opened.

5. All interest and capital gains in T. Rowe Price Growth Stock Fund, Inc. should be reinvested in this fund.
6. All interest and capital gains on Massachusetts Investors Growth Stock Fund should be reinvested in this fund.
7. At the end of each year an audit of the Rent and Services payments to Med-Chi should be requested.

A suggestion was made that the Finance Committee investigate the possibility of placing some of the funds in three-month Government bonds with one of the Banks as this would yield approximately 7% interest.

Drs. Schimunek, Kaltreider, and Wagley were asked to continue as members of the Finance Committee and each agreed.

Robert B. Goldstein, MD, Secretary of the Society, reported that he planned to discuss the binding and preservation of the minutes of the Society with an expert in the field in the near future and would report his findings at the next meeting of the Board.

The next item on the agenda was a letter from the Baltimore City Health Department requesting the Society to assist in preparing a standard physical examination form for children entering camps and other recreational facilities. Dr. Robinson requested W. Kenneth Mansfield, MD, Paul A. Mullan, MD, Hammond J. Dugan, MD, and Frederick K. Adams, MD to study this problem with Jimmie L. Rhyne, MD, Director of Child Health Services, Baltimore City Health Department, and submit their recommendations to the Board for consideration.

A letter was read to the Board of Directors from a physician presently in service of the U.S. Public Health Service requesting the permission of the Society to accept employment in a local hospital and engage in some private practice. It was the opinion of the Board that if the physician met the requirements of the Board of Medical Examiners of the State of Maryland, the Society should have no objection to these activities.

Correspondence was read from George M. Owen, MD, Associate Professor of Pediatrics, Ohio State University, who is presently engaged in a national research project evaluating the nutritional status of preschool children. Dr. Owen requested the sanction of the Baltimore City Medical Society for that portion of the study which would be conducted in Baltimore City. After much discussion, it was decided that the Baltimore City Medical Society would support the study if the requirements with regard to physician licensure set down by the Board of Medical Examiners were complied with by the physicians involved. The program has already been accepted by the City, County and State Health Departments.

The salaries of the office staff of the Baltimore City Medical Society were reviewed and appropriate adjustments made.

The meeting was adjourned at 5:45 PM.

Baltimore County Medical Association

The Baltimore County Medical Asosciation met at Mount Wilson Hospital, on September 17, at the invitation of William Newcomer, MD, and the hospital staff.

After lunch, the President, Theodore Patterson, MD, conducted the routine business of the association. Ten new members were admitted to active membership.

A scientific session followed. Elmer P. Sauer, MD, of the Mt. Wilson Hospital staff, spoke first on the subject of emphysema, and later on the present treatment of tuberculosis.

At the end of the session, Dr. Patterson thanked Dr. Sauer and the staff for the luncheon and the very interesting scientific program. The meeting was well attended.

Drugs Prescribed in Obstetrics

Drugs used in obstetrics present a unique problem. They not only have an effect on the mother, but they may have an effect on the developing conceptus. It is established that certain chemical compounds that are administered to pregnant women can influence adversely the development of the unborn child. However, it is difficult to prove in human beings a causal relationship between administration of a drug to the mother and the appearance of a congenital malformation in her child. Although all therapeutic agents are not capable of transmission across the placental membranes, some drugs do affect the fetus in one way or another.

Desirable are therapeutic drugs that do not pass into the fetal circulation. These drugs benefit the maternal organism without causing toxic levels in the fetus. In this category may be such agents as barbiturates which normally are detoxified by the liver. Nevertheless, the mere inability of a drug to be transported across the placental barrier does not assure complete protection for the unborn child. For the most part, scientists are not sure what mechanisms cause teratogenic results. To the list of hazardous antibiotics and sulfas we must add insulin, thyroid hormone, cortisone, vitamin A, quinine, most anticancer drugs, and even toxic doses of aspirin. In almost every instance, however, the defect produced depends upon three factors: the size of dosage, its frequency, and the stage of pregnancy when the drug is administered.

Since the thalidomide tragedy in 1960-62 and the appearance of phocomelia resulting from the administration of that drug to pregnant women, much effort has been directed toward research and the acquisition of knowledge concerning the dangers involved in prescribing drugs to pregnant women. Dr. Lowell T. Coggeshall was made chairman of a 14-member Commission on Drug Safety established in 1962; later, with the encouragement of The Department of Health, Education, and Welfare, the National Academy of Science-National Research Council established the Drug Research Board, the permanent advisory body on drug safety.

Medicine is a living, changing discipline. To keep informed the practicing physician reads current scientific literature. Of current interest to obstetricians are tables on information on drugs, titled "Drugs Adversely Affecting the Human Fetus," published in *Hospital Formulary Management,* June, 1969. This information is summarized in an effort to alert physicians to the increasing number of drugs that are potentially dangerous to the developing fetus. The tables are compiled by Al Takata, Pharm. D., of Alta Bates Community Hospital, Berkeley, California. Reprints are available from Clissold Publishing Company, 105 West Adams Street, Chicago, Illinois 60603.

THE BEST CARE AVAILABLE
UNDER CONSTANT MEDICAL SUPERVISION
MODERATE RATES

Coming out of a depression.

And it can often begin to happen in 3 to 5 days with an antidepressant like Pertofrane. There's a lifting of depressed mood... a restoration of psychomotor activity. Patients usually begin to cope, work, maybe play, even enjoy.

It's not all beautiful. Sometimes there are side effects. And not everybody can take the drug. It may even be a slow process. But along with the care and comfort you give depressed patients, consider Pertofrane. Then consider the response.

Please read the prescribing information for full details on contraindications, warnings, precautions, adverse reactions and dosage. It's summarized on the left.

Pertofrane®

desipramine hydrochloride

New 50-mg. capsules now available

Pertofrane® desipramine hydrochloride

Indication: Mental depression.

Contraindications: Do not use MAO inhibitors concomitantly or within 2 weeks of the use of this drug. Hyperpyretic crises or severe convulsive seizures may occur with such combinations; potentiation of adverse reactions can be serious or even fatal.

When substituting Pertofrane in patients receiving an MAO inhibitor, allow an interval of at least 14 days. Initial dosage in such patients should be low and increases should be gradual and cautiously prescribed.

The drug is contraindicated following recent myocardial infarction and in patients with a known hypersensitivity to tricyclic antidepressants.

Warning: Activation of psychosis may occasionally be observed in schizophrenic patients. Due to atropine-like effects and sympathomimetic potentiation, use only with the greatest care in patients with narrow-angle glaucoma or urethral or ureteral spasm.

Do not use in patients with the following conditions unless the need outweighs the risk: severe coronary heart disease with EKG abnormalities, progressive heart failure, angina pectoris, paroxysmal tachycardia and active seizure disorder (may lower seizure threshold).

Desipramine and the parent compound, imipramine, have been shown to block the action of guanethidine and related adrenergic neuron-blocking agents.

Hypertensive episodes have been observed during surgery.

The concurrent use of other central nervous system drugs or alcohol may potentiate adverse effects. Since many such drugs may be used during surgery, desipramine should be discontinued prior to elective procedures.

Caution patients on the possibility of impaired ability to operate a motor vehicle or dangerous machinery.

Do not use in women who are or may become pregnant unless the clinical situation warrants the potential risk, and do not use in patients under 12 years of age.

Because of increased sensitivity to the drug, use lower than normal dosage in adolescent and geriatric patients.

Precautions: Potentially suicidal patients require careful supervision and protective measures during therapy. Discontinuation of the drug may be necessary in the presence of increased agitation and anxiety shifting to hypomanic or manic excitement.

Atropine-like effects may be more pronounced (e.g. paralytic ileus) in susceptible patients and in those receiving anticholinergic drugs (including antiparkinsonism agents).

Prescribe cautiously in hyperthyroid patients and in those receiving thyroid medications; transient cardiac arrhythmias have occurred in rare instances.

Periodic blood and liver studies should supplement careful clinical observations in all patients undergoing extended courses of therapy.

Adverse Reactions: The following have been reported: *Nervous System:* dizziness, drowsiness, insomnia, headache, disturbed visual accommodation, tremor, unsteadiness, tinnitus, paresthesias, changes in EEG patterns, epileptiform seizures, mild extrapyramidal activity, falling and neuromuscular incoordination. A confusional state (with such symptoms as hallucinations and disorientation), particularly in older patients and at higher dosage, may require discontinuation of the drug. *Gastrointestinal Tract:* anorexia, dryness of the mouth, nausea, epigastric distress, constipation and diarrhea. *Skin:* skin rashes (including photosensitization), perspiration and flushing sensations. *Liver:* rare cases of transient jaundice (apparently of an obstructive nature) and liver damage. If jaundice or abnormalities in liver function tests occur, discontinue the drug and investigate. *Blood Elements:* bone-marrow depression, agranulocytosis, thrombocytopenia and purpura. If these occur, discontinue the drug. Transient eosinophilia has been observed. *Cardiovascular System:* orthostatic hypotension and tachycardia. Carefully supervise patients requiring concomitant vasodilating therapy, particularly during initial phases. *Genitourinary System:* urinary frequency or retention and impotence. *Endocrine System:* occasional hormonal effects, including gynecomastia, galactorrhea and breast enlargement, and decreased libido and estrogenic effect. *Sensitivity:* urticaria and rare instances of drug fever and cross-sensitivity with imipramine.

Dosage: All patients except geriatric and adolescent: 50 mg. t.i.d. (150 mg. daily). Dosage may be increased up to 200 mg. daily. Geriatric and adolescent patients should usually be started with lower dosage (25 to 50 mg. daily) and may not tolerate higher doses. Dosage may be increased up to 100 mg. daily.

Lower maintenance dosages should be continued for at least 2 months after obtaining a satisfactory response.

Mild anxiety and agitation which may accompany depression usually remit as the depression responds. Occasionally, however, a sedative or tranquilizer may be indicated.

Availability: Maroon and pink capsules of 50 mg. in bottles of 100; pink capsules of 25 mg. in bottles of 100 and 1000. (B)46-530-G

Geigy

It's beautiful!

Ornade® Spansule®

brand of
sustained release capsules

Trademark

Each capsule contains 8 mg. of Teldrin® (brand of chlorpheniramine maleate); 50 mg. of phenylpropanolamine hydrochloride; 2.5 mg. of isopropamide, as the iodide.

Prompt relief from nasal congestion and hypersecretion due to colds.

Before prescribing, see complete prescribing information in SK&F literature or *PDR*.
Contraindications: Glaucoma, prostatic hypertrophy, stenosing peptic ulcer, pyloroduodenal or bladder neck obstruction.
Precautions: Use cautiously in the presence of hypertension, hyperthyroidism, coronary artery disease; warn vehicle or machine operators of possible drowsiness.
Usage In Pregnancy: Use in pregnancy, nursing mothers and women who might bear children only when potential benefits have been weighed against possible hazards.
Note: The iodine in isopropamide iodide may alter PBI test results and will suppress I^{131} uptake; discontinue 'Ornade' one week before these tests.
Adverse Reactions: Drowsiness; excessive dryness of nose, throat or mouth; nervousness; insomnia. Other known possible adverse reactions of the individual ingredients: nausea, vomiting, diarrhea, rash, dizziness, fatigue, tightness of chest, abdominal pain, irritability, tachycardia, headache, incoordination, tremor, difficulty in urination. Thrombocytopenia, leukopenia and convulsions have been reported.
Supplied: Bottles of 50 capsules.

One capsule q12h for round-the-clock relief

Home Care of Chronic Respiratory Disease

In an effort to reduce the number of hospital readmissions, or prevent permanent hospitalization of patients with chronic respiratory insufficiency, a Home Care Program was established ten years ago by the Winnipeg General Hospital. Paramedical personnel play an important role in the successful operation of the program at low cost.

In 1958, the Winnipeg General Hospital (Manitoba, Canada) established a "Home Care Program" for patients with chronic respiratory insufficiency. It was hoped that repeated hospital admissions or permanent hospitalization for such patients would prove unnecessary. This report is concerned with the experience during the first ten years.

Patients with repeated hospital admissions over a period of years, or with persistent hypoxia and hypercapnia, despite intensive therapy, were given high priority for admission to the program. The suitability of the patient was judged by his medical history and physical status, respiratory function, home and family situation, and medical and paramedical requirements.

During the ten-year period the 148 admissions spent a total of 71,247 days on the program. The average was 482 days. There were 70 deaths (47%). The average length of time on the program of those who died was 361 days.

Of 14 patients admitted to the program between 1958 and 1962, only one is alive at the time of this report. Of 39 admitted between 1963 and 1965, 15 (48%) are still alive.

Rehospitalization was required for 82 patients, or 55%. However, the total hospitalization of these patients was 4,078 days, and they were on the Home Care Program only 5.7% of this time.

Reuben M. Cherniack, MD; Robert G. Handford, MD, and Edith Svanhill. *The Journal of the American Medical Association,* May 5, 1969.

Cost of Program

The cost of the program for one year (1967) was $15.262.69. The cost per patient per year was $193.20, or 53 cents a day. The costs include maintenance of equipment and administration as well as physician and nurses fees, homemaking service, transport, meal delivery, and oxygen. In Winnipeg this annual cost would cover only four or five days in an acute-care hospital bed; seven to eight days in a chronic-care hospital, and ten to twelve days in a nursing home.

Financing of the program is from funds of the Manitoba Hospital Commission and from a provincial government rehabilitation health grant. A few patients may be asked to contribute to the cost on the basis of their reported taxable income, but this is rare. Intermittent Positive Pressure Breathing (IPPB) equipment is loaned to the individual patient from a central pool operated by the provincial government.

Patients thus far admitted to the study were all suffering from a chronic illness, principally respiratory, cardiac, neurological, or malignant disease.

The program is administered by a medical director, or secretary, and a nursing coordinator who serve as a "health team" in providing the medical and paramedical services required by the patient. The team has responsibility also for the dissemination of reports to and from other agencies active in the program.

In 1967 nurses of the Victorian Order of Nurses made 1,560 visits to the patients at home. Reassess-

ment of the patient's condition was made at intervals of from two to six months in the outpatient clinic of the hospital. When necessary, the resident physician assigned to respiratory diseases visited the patient at home.

Other Services

Provision is also made for the services of such other paramedical personnel as inhalation therapists and physiotherapists and, where called for, a homemaker to assist the family. Although the majority of patients go to the hospital for physiotherapy, a physiotherapist, on occasion, may visit the home. Regular communication is maintained with patients who live in the country some distance from the hospital.

In the care of chronic respiratory disease patients, the measures used have been designed primarily to mitigate functional disturbances and to prevent exacerbations of acute respiratory insufficiency. The majority of these patients had chronic obstructive pulmonary disease. Among them resistance to airflow was a major problem, probably due to secretions, loss of elasticity, or bronchospasm or both. Care of these patients has been directed at reducing the work of breathing, increasing alveolar ventilation, and improving exercise tolerance.

Reduction in secretions was accomplished by removal of irritants, particularly cessation of smoking; by saline douches of the nasal passages in patients with postnasal discharge; and by prompt and vigorous treatment of infection.

By adequate hydration and postural drainage, elimination of secretions was improved. Bronchospasm was relieved by effective oral and aerosol administration of bronchodilators. For many patients with chronic obstructive lung disease who were unable to take a deep breath and had inadequate alveolar ventilation persistently, IPPB was provided at home.

Increased Mobility

Diaphragmatic breathing training was a part of the program, as was gradual increase in physical activity. Although excessive physical activity was avoided during an acute illness, invalidism was discouraged. General physical fitness improved with reasonable physical activity through gradually increased exercise. This ability to increase mobility and exercise tolerance improved mental outlook.

Although it is disappointing that the life span of the patients on the program was not longer, it must be emphasized that the prerequisites for admission were stringent. The real benefits cannot be deduced from the number of hospital readmissions and the mortality statistics. Several patients with severe insufficiency were sent home even though it was realized they might have to be readmitted to the hospital. In several instances, patients were discharged from the hospital to spend their last few days at home.

Care of the patients was primarily centered around paramedical services rather than medical. The cost of home visits by residents was only a small part of the total cost of the program. Paramedical personnel should certainly be considered an integral and essential component of the management of patients with chronic respiratory insufficiency.

The program made prolonged stays in the hospital unnecessary, and likewise long confinement in nursing homes or extended care institutions. The patient and his family responded to the opportunity for him to remain in comfortable and familiar surroundings during the late phases of his illness.

ROBERT E. FARBER, MD, MPH, COMMISSIONER

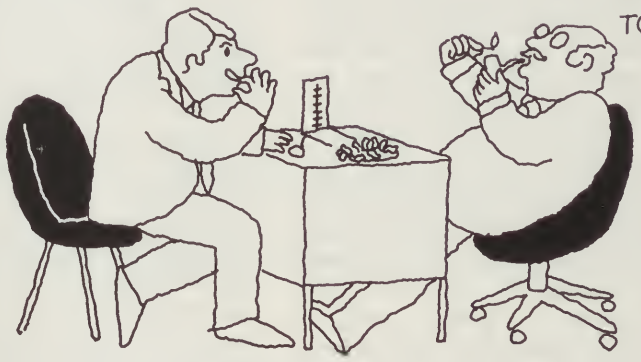
Baltimore City
health department

New Deputy Commissioner

John B. De Hoff, MD, former director of local health services in the Baltimore City Health Department, has been named Deputy Commissioner, effective July 31. In this post Dr. De Hoff will help chart the course of public health in Baltimore by assisting in the formation and direction of the city-wide public health program. As Deputy Commissioner, Dr. De Hoff will work closely with the city's medical profession and health-oriented groups in their efforts to bring better health to all Baltimoreans.

A life-long resident of Baltimore, Dr. De Hoff is the son of the late George W. De Hoff, MD. He received his education in the public schools of the city and at The Johns Hopkins University where he received the BA, MD, and Master of Public Health degrees. During World War II, he served in the Army Medical Corps both in the United States and Europe. Entering private practice in the city after the war, Dr. De Hoff maintained his army reserve status and retired as Colonel and Commander of the 92nd Field Hospital in 1965. That same year he became Assistant Commissioner and director of local health services in the city's Health Department.

Dedicated to improving community medicine, Dr. De Hoff has taken an active interest in the Medical and Chirurgical Faculty of Maryland and the Baltimore City Medical Society. He has served on committees concerned with medical care, diabetes detection, sports medicine, and others in the preventive medicine field.

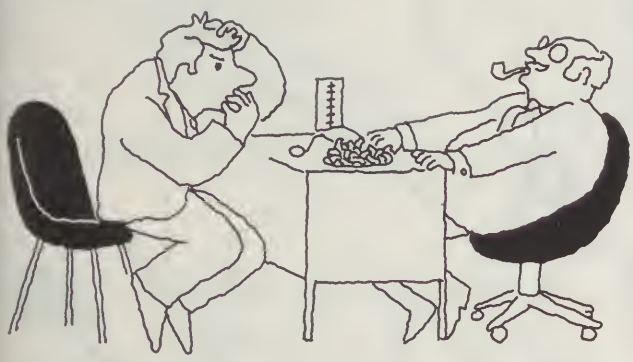


As director of local health services, Dr. De Hoff helped establish the Provident Hospital Comprehensive Neighborhood Health Center and serves as Vice President of the Neighborhood Council for the center. He is a member of the Community Health Council of Bon Secours Hospital, the Social Work Manpower Committee, the Advisory Council to the Job Skill Center, and others. In addition, he is also chairman of the organization committee for the Allied Health Sciences Consortium, a new local group for expanding educational opportunities in health fields for the disadvantaged.

Dr. De Hoff is an Associate in Medicine and Preventive Medicine at the University of Maryland and a lecturer in public health administration at The Johns Hopkins School of Hygiene and Public Health. Since he helped plan the Provident Hospital Comprehensive Neighborhood Health Center, he was also recently invited to offer testimony on comprehensive medical care programs for the poor before the United States Senate Subcommittee on Health.

Dr. De Hoff is a Fellow of the American Public Health Association and serves as representative for the local affiliate, the Maryland Public Health Association. He is also a member of the Aerospace Medical Association and the Society of Medical Consultants to the Armed Forces. His past achievements have earned him the Alexander Cochran Bowen-Harlow Brooks Scholar Award of the New York Academy of Medicine, and Certificates of Achievement from the U.S. Army. He has written numerous articles on a wide variety of medical subjects which have been published in local and national professional journals.

The Apprehensive Hypertensive



Regroton® to lower blood pressure

chlorthalidone 50 mg.
reserpine U.S.P. 0.25 mg.

Regroton®: chlorthalidone 50 mg., reserpine U.S.P. 0.25 mg.
Indications: Hypertension. *Contraindications:* History of mental depression, hypersensitivity, and most cases of severe renal or hepatic diseases. *Warning:* With the administration of enteric-coated potassium supplements, which should be used only when adequate dietary supplementation is not practical, the possibility of small-bowel lesions (obstruction, hemorrhage, and perforation) should be kept in mind. Surgery for these lesions has frequently been required and deaths have occurred. Discontinue coated potassium-containing formulations immediately if abdominal pain, distention, nausea, vomiting, or gastrointestinal bleeding occur. Discontinue one week before electroshock therapy, and if depression or peptic ulcer occurs. *Use in pregnancy:* Because chlorthalidone may cross the placental barrier and appear in cord blood and thiazides may appear in breast milk, this drug should be used with care in pregnant patients and nursing mothers. When used in women of childbearing age, the potential benefits of the drug should be weighed against the possible hazards to the fetus. Use of chlorthalidone may result in fetal or neonatal jaundice, thrombocytopenia, and possibly other adverse reactions which have occurred in the adult. Increas respiratory secretions, nasal congestion, cyanosis and anorexia m occur in infants born to reserpine-treated mothers. *Precautions:* Antih pertensive therapy with this drug should always be initiated cautious in postsympathectomy patients and in patients receiving ganglion blocking agents, other potent antihypertensive drugs, or curare. Redu dosage of concomitant antihypertensive agents by at least one-half. avoid hypotension during surgery, discontinue therapy with this age two weeks prior to elective surgical procedures. In emergency surge use, if needed, anticholinergic or adrenergic drugs or other supporti measures as indicated. Because of the possibility of progression renal damage, periodic kidney function tests are indicated. Discontin if the BUN rises or liver dysfunction is aggravated. Hepatic coma m be precipitated. Electrolyte imbalance, sodium and/or potassium d pletion may occur. If potassium depletion should occur during therap the drug should be discontinued and potassium supplements give provided the patient does not have marked oliguria. Take particular ca in cirrhosis or severe ischemic heart disease and in patients receivi

and allay anxiety in hypertension

corticosteroids, ACTH, or digitalis. Severe salt restriction is not recommended. Use cautiously in patients with ulcerative colitis or gallstones (biliary colic may be precipitated). Bronchial asthma may occur in susceptible patients. *Adverse Reactions:* The drug is generally well tolerated. The most frequent side effects are nausea, gastric irritation, vomiting, diarrhea, constipation, muscle cramps, headache, dizziness and acute gout. Other potential side effects include angina pectoris, anxiety, depression, bradycardia and ectopic cardiac rhythms (especially when used with digitalis), drowsiness, dull sensorium, hyperglycemia and glycosuria, hyperuricemia, lassitude, restlessness, transient myopia, impotence or dysuria, orthostatic hypotension which may be potentiated when chlorthalidone is combined with alcohol, barbiturates or narcotics, leukopenia, aplastic anemia, skin rashes, thrombocytopenia, agranulocytosis, nasal stuffiness, increased gastric secretions, nightmare, purpura, urticaria, ecchymosis, weakness, uveitis, optic atrophy and glaucoma, and pruritus. Eruptions and/or flushing of the skin, a reversible paralysis agitans-like syndrome, blurred vision, conjunctival injection, increased susceptibility to colds, dyspnea, weight gain, decreased libido, dryness of the mouth, deafness, anorexia, and pancreatitis when epigastric pain or unexplained G.I. symptoms develop after prolonged administration. Jaundice, xanthopsia, paresthesia, photosensitization and necrotizing angiitis are possible. *Average Dosage:* One tablet daily with breakfast. *Availability:* Pink, single-scored tablets in bottles of 100 and 1000. (B) 46-600-C

More than 4,000 of Maryland's businesses choose BLUE SHIELD®

Who knows value better than those who buy insurance for leading corporations? It's no accident that an overwhelming majority of them select Blue Shield for their employees. In Maryland, more than 4,000 businesses have chosen Blue Shield protection for their employees. That adds up to more than one million Marylanders who carry the Blue Shield card today.

Without the sponsorship of your local medical society, Blue Shield could not exist. Without the devoted services of you and your colleagues who serve on Blue Shield Boards the country over, Blue Shield could not serve its members so economically.

To find out more about the basic value of Blue Shield to you as a doctor, just use the convenient coupon.

WILLIAM J. PEEPLES, MD, MPH, COMMISSIONER

Maryland State department of health

Growth of Day Care Centers for the Mentally Retarded

Neil Solomon, MD, Secretary of Health and Mental Hygiene, announced that departure from established procedure, a willingness to test new methods of training, and a firm belief that every individual has some capacity to learn, have characterized Maryland's program of Day Care for the Mentally Retarded. Established in 1961 as a complement to existing health services in the state, the day care program has grown and flourished as a community oriented activity.

Much of the strength and success of this statewide program are directly attributable to the effective use of nonprofessionals. This trend, which is beginning to develop in many areas, is commonly thought to be a result of the chronic manpower shortage. However, in Maryland, the use of nonprofessional personnel was an integral part of the entire day care plan.

This approach was adopted as a means of keeping day care noncompetitive with special education and preventing duplication of programs. The thinking was that, under close supervision, nonprofessional personnel could carry on basic, developmental training while supervision would be provided by state consultants and by center directors with professional backgrounds.

In the early stages of development, services for mentally retarded children and adults included no provisions other than institutional care for the more dependent individuals functioning on lower levels. However, many parents and professionals felt that this group could develop more fully in a home environment, with the help of a training program geared to their specific needs—needs which could not be met in existing, classroom-type facilities.

The first step toward exploring this possibility was made in 1961 when the Maryland General Assembly made state funds available for the development of community day care centers for the mentally retarded. The legislation stipulated that the State Department of Health would set operating standards and then make the funds available to counties on a matching basis. An additional key feature was that a private nonprofit corporation would be responsible for the operation of each local center. Membership of the Board of the operating group would consist of representatives from health, education, social services, parents and the community.

Community acceptance of the challenge is reflected by the ever increasing numbers of centers. Starting with the first center in 1961, 18 Boards of Directors are presently operating 32 centers located in 13 counties and Baltimore city, with another expected to open in the fall. Accompanying increases in enrollment and budget are shown on the chart, along with a projection for fiscal 1970.

JUDGE ANTIBIOTIC OINTMENTS HERE

Results on skin are final proof of any topical antibiotic's effectiveness

No in vitro test can duplicate a clinical situation on living skin. 'Neosporin' (polymyxin B—bacitracin—neomycin) Ointment has consistently proven its effectiveness in thousands of cases of bacterial skin infection. The spectra of the three antibiotics overlap in such a way as to provide bactericidal action against most pathogenic bacteria likely to be found topically. Diffusion of the antibiotics from the special petrolatum base is rapid since they are insoluble in the petrolatum, but readily soluble in tissue fluids. The Ointment is bland and nonirritating.

Caution: As with other antibiotic preparations, prolonged use may result in overgrowth of nonsusceptible organisms and/or fungi. Appropriate measures should be taken if this occurs. Articles in the current medical literature indicate an increase in the prevalence of persons allergic to neomycin. The possibility of such a reaction should be borne in mind.

Contraindications: This product is contraindicated in those individuals who have shown hypersensitivity to any of its components.

Supplied: Tubes of 1 oz., ½ oz. with applicator tip, and ⅛ oz. with ophthalmic tip.

Complete literature available on request from Professional Services Dept. PML.

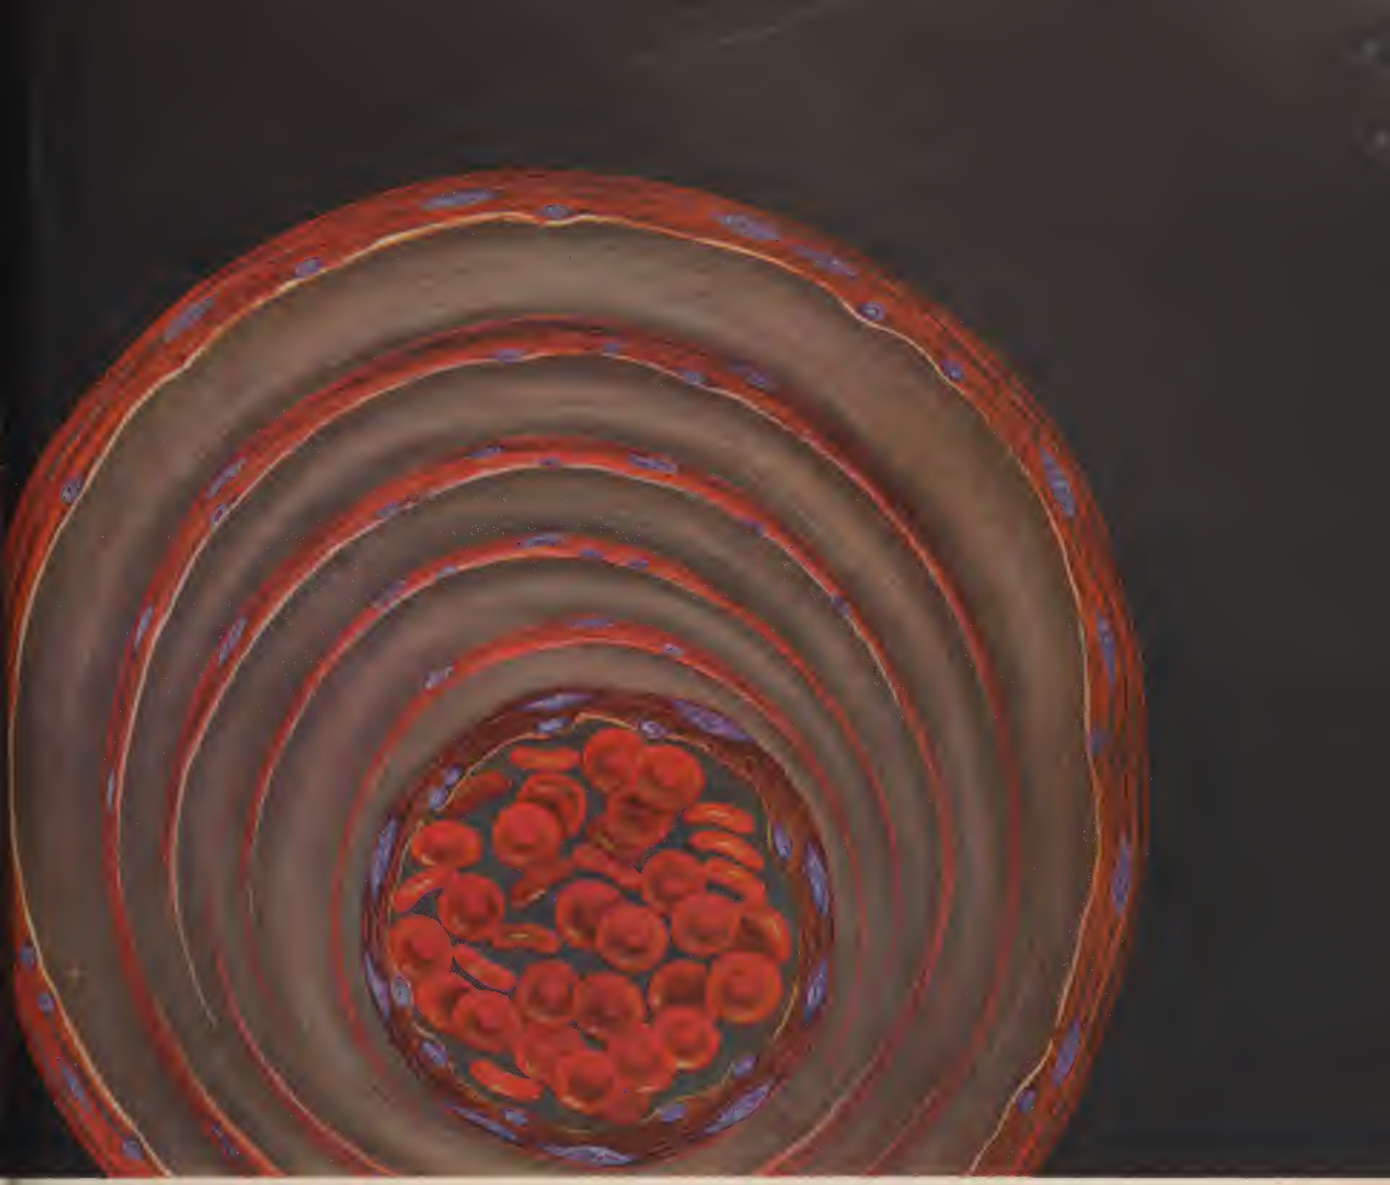
Roniacol® Timespan®
(nicotinyl alcohol tartrate)



Because peripheral vasodilatio is needed now... and must often be continued

Roniacol Timespan (nicotinyl alcohol tartrate) can make a significant contribution to effective treatment of peripheral vascular disorders. It is directed specifically toward improvement of peripheral blood flow, relief of ischemic symptoms, and the long-term management of these conditions.

Specific pharmacologic action—Roniacol (nicotinyl alcohol) acts selectively by relaxing smooth muscle of peripheral blood vessels. Onset of action is smooth and gradual, rarely causing severe flushing.

Relative freedom from side effects—Side effects that may occur occasionally with Roniacol seldom require discontinuation of therapy

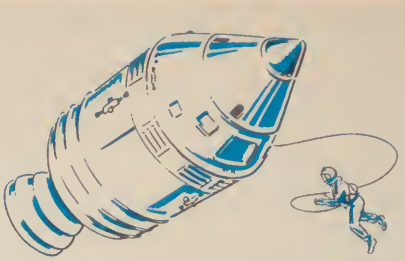
Prolonged, continuous drug release—Prolonged peripheral vasodilation is provided sustained-release Roniacol Timespan (nicc alcohol tartrate) Tablets. Part of the drug b comes available immediately, the remaind continuously over a period of up to 12 hou and dilation of constricted peripheral vess usually maintained. Thus, with a single dos medication, patients can enjoy the benefit increased peripheral blood flow in ischem extremities for up to 12 hours.

mooth peripheral vasodilation from initial osage...extended with mple, well-tolerated, b.i.d. dosage

prolonged action of Roniacol Timespan otinyl alcohol tartrate) together with its er benefits offer a therapeutically practical sure in the long-term management of pheral vascular disease–advantages ecially important for older patients.

ore prescribing, please consult complete duct information, a summary of which ows:

cations: Conditions associated with cient circulation; e.g., peripheral vascular ase, vascular spasm, varicose ulcers, bital ulcers, chilblains, Meniere's syn- me and vertigo.



Caution: Roche Laboratories endorses caution in the administration of any therapeutic agent to pregnant patients.

Side Effects: Transient flushing, gastric disturbances, minor skin rashes and allergies may occur in some patients, seldom requiring discontinuation of the drug.

Dosage: 1 or 2 Timespan Tablets—150 mg nicotinyl alcohol in the form of the tartrate salt—bottles of 50 and 500.

Art is a conception of peripheral vasodilation.

Man in space, now fait accompli, re-emphasizes the importance of Uro-Phosphate therapy. Research into the effect of space travel on the astronaut reveals that weightlessness causes loss of bone calcium. As the bones are required to bear less and less of the weight of the body they lose calcium, increasing the calcium content of the urine. When physical activity is reduced, the acidity of the urine should be adjusted to keep increased calcium in solution . . . . a prophylaxis to prevent kidney or bladder calculi.

Uro-Phosphate®

NOW A SUGAR-COATED TABLET

Each tablet contains: METHENAMINE, 300 mg.; SODIUM ACID PHOSPHATE, 500 mg.

Uro-Phosphate gives comfort and protection when inactivity causes discomfort in the urinary function. It keeps calcium in solution, preventing calculi; it maintains clear, acid, sterile urine; it encourages complete voiding and lessens frequency when residual urine is present.

Uro-Phosphate contains sodium acid phosphate, a natural urinary acidifier. This component is fortified with methenamine which is inert until it reaches the acid urinary bladder. In this environment it releases a mild antiseptic keeping the urine sterile.

Uro-Phosphate is safe for continuous use. There are no contra-indications other than acidosis. It can be given in sufficient amount to keep the urine clear, acid and sterile. A heavy sugar coating protects its potency.

Dosage:

For protection of the inactive patient 1 or 2 tablets every 4 to 6 hours is usually sufficient to keep the urine clear, acid and sterile.

2 tablets on retiring will keep residual urine acid and sterile, contributing to comfort and rest.

A clinical supply will be sent to physicians and hospitals on request.

woman's auxiliary

Maryland Auxiliary Shares Spotlight at National Convention

Woman's Auxiliary representatives at the National Convention in New York City in July included: (from left) Mrs. R. Kennedy Skipton, 3rd Vice President; Mrs. Leonard G. Warres, Immediate Past President; Mrs. Wallace H. Sadowsky, President, and Mrs. Elmer G. Linhardt, 1st Vice President.

The 46th annual convention of the Woman's Auxiliary to the American Medical Association was held at New York's Waldorf-Astoria Hotel July 13-17, 1969. Among the 919 registered were the following members of the Woman's Auxiliary to the Medical and Chirurgical Faculty of the State of Maryland: Mrs. Wallace H. Sadowsky, President; Mrs. H. Leonard Warres, Immediate Past President, Mrs. R. Kennedy Skipton, 3rd Vice President and Chairman of Delegates; Mrs. Elmer G. Linhardt, 1st Vice President and Delegate; Mrs. Harold P. Biehl, Alternate; and Mrs. James L. Garey, Alternate.

National Auxiliary president, Mrs. John M. Chenault, Decatur, Alabama, who presided over the sessions, said: "Let us direct our energy toward achieving better health conditions and use our imagination in developing projects and programs which will meet the health needs of our communities . . . As we work with our medical societies, let us be ready to stand up and be counted as we speak with pride for those things which are right with American medical practice."

Mrs. Chenault filled the unexpired term of her predecessor, Mrs. C. C. Long, Ozark, Arkansas, who died suddenly on April 22. Emotion choked the voices of the auxiliary members as they repeated in unison the 23rd Psalm at the memorial service where tribute was paid to Mrs. Long, the beloved, gallant leader who directed the activities of the auxiliary and had made all of the plans for the 1969 convention before her untimely death. In memory of Mrs. Long, a resolution on anti-violence in television and motion pictures was passed by the House of Delegates.

The Maryland auxiliary was the recipient of a Membership Recognition Award presented for "an outstanding membership program in 1968-69" by Mrs. G. Prentiss Lee, 1st Vice President of the national auxiliary.

Among the outstanding features of the convention were the new "Show and Tell" exhibits and films. Some 20 exhibits, illustrative of the imaginative programs conducted by Auxiliary members, were on display Tuesday, July 15. This allowed state and local auxiliaries to learn about one another's projects and provided an interchange of ideas. Mrs. Harold P. Biehl, Baltimore, Children and Youth Chairman, prepared a very fine exhibit entitled "Violence," which showed how the Auxiliary members in Maryland put forth efforts to rid television, radio, and movies of violence.

Also, among the "Show and Tell" films shown was one entitled "The Many Hats of Laurie and Harriet," sponsored jointly by the Maryland medical auxiliary, the Baltimore city medical auxiliary, the Maryland Nurses Association, and the Baltimore City Health Department. The film follows two public health nurses through a typical day of administering to the needs of patients in their assigned areas.

During the luncheon on July 14, Mrs. Chenault presented the Auxiliary's contribution to the American Medical Association Education and Research Foundation to Milford O. Rouse, MD, president of AMA-ERF. This year's record-breaking sum totaled $428,875.77, bringing the Auxiliary's total contribution since 1951 to $3,697,132.77. The Woman's Auxiliary to the California Medical Association received an award of merit for making the largest contribution to the program—$69,740.21. The total raised by the Maryland auxiliary from June 1, 1968 to May 31, 1969 was $5,795.18.

Ethel Alpenfels, PhD, Professor of Anthropology at New York University, addressed the assembly at the Tuesday morning session. She predicted that in five to ten years, society will require a physician who understands not only the physical and the medical facts, but who also understands human beings. "The medical profession today must begin to examine attitudes, its own as well as its patients'. To understand how a patient sees and how he acts is to understand the culture in which he lives," Dr. Alpenfels said.

During the Tuesday morning session, Henry C. Huntley, MD, director of the Division of Emergency Health Services for the department of Health, Education, and Welfare, U. S. Public Health Service, made a presentation of the Emergency Health Services Award to the Woman's Auxiliary to the Honolulu County Medical Society for its outstanding achievements in informing Hawaiian residents about various poisons.

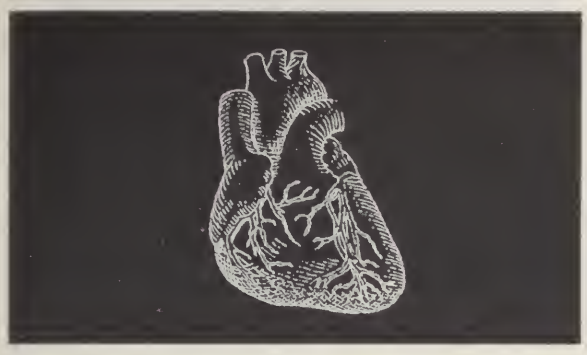
Mrs. Charlotte Montgomery, author of the "Speaker of the House" column in *Good Housekeeping* and Vice President of the Women's Conference of the National Safety Council, presented a National Safety Council award to the Woman's Auxiliary to the Oklahoma County Medical Society for its "Teen Sitter Workshop" program which trained more than 2,000 teenagers.

Ann Landers, author of the world's most widely syndicated advice column and a member of the AMA's Advisory Committee on Health Care of the American People, was the guest speaker at the Tuesday luncheon honoring National Past Presidents, Officers, Directors and Committee Chairmen. Miss Landers cited some of the mail she receives from physicians' wives and mentioned some of their common problems.

"Lack of communication is the greatest stumbling block in most marriages. Men who run multi-million dollar corporations can't handle their kids . . . or think of anything to say to their wives. . . .

"We are paying dearly for our money-oriented culture. We know the price of everything and the value of nothing. . . .

"Young people aren't worse than we were, only different. But that must be expected because the world has changed so much in the last 35 years. They have the disadvantage of having too many advantages. Our culture has changed from the survival of the depression times to lack of motivation and new values. . . .



"Being a wife of a doctor is a tough assignment, but wives of other professionals have the same complaint, the most universal being the lack of communication."

In her inaugural address on Wednesday, July 16, Mrs. Chenault outlined a plan for carrying out her theme for the year, "Active Leadership in Community Health With the Accent on Youth." She urged the Auxiliary members to "study the health resources of the area in which they live and to evaluate the human resources with which they have to work." She encouraged Auxiliary members to work closely with their husbands and sponsoring medical societies to "raise the level of health care for all the people."

The Wednesday afternoon session concluded with a discussion on "Health Education Through Package Programs," followed by the showing of the film, "Escape to Nowhere." This film is the real life story of drug use told "like it is" by kids who use drugs. It is recommended for showing to senior high, college and adult audiences.

The report of the 46th annual convention of the Auxiliary to the American Medical Association by Mrs. R. Kennedy Skipton was read in Mrs. Skipton's absence by Mrs. Richard D. Bauer at the Board Meeting of the Maryland auxiliary held at the summer home of the president, Mrs. Wallace H. Sadowsky, Ocean City, Maryland on August 4, 1969.

Effect of Other Drugs on Oral Anticoagulants

LAWRENCE F. AWALT, MD
Senior Fellow-in-Cardiology
University of Maryland Hospital

Introduction

The use of oral anticoagulants remains popular for the treatment of thromboembolic problems. The need to closely monitor these drugs with the one-stage prothrombin time is widely recognized and practiced. There is wide variation in the response to a given dose of these agents. Inherited resistance to these drugs is a well documented phenomenon. The author has encountered one individual who (unfortunately there was no family available for study) required between 50 and 75 mg of sodium warfarin a day to maintain his prothrombin level in the minimum therapeutic range.

More common, however, but not always so well remembered, are the numerous other factors which effect the prothrombin time in the presence of oral anticoagulants. Weak and debilitated individuals, those with intestinal malabsorbtion, persons with chronic liver disease, acute alcoholism with or without chronic liver disease, as well as persons of very advanced age, all tend to have an increased sensitivity to the effects of oral anticoagulants. Accordingly, the loading dose and subsequent maintenance doses have to be adjusted downward from the average for these persons. Here again, however, there is wide variability.

The most frequent difficulties arise with the concomitant use of other drugs. These may be divided into those which potentiate and those which depress the prothrombin response to anticoagulants.

Potentiating Drugs

Aspirin is well known in this regard and is probably the most frequently encountered. Acetaminophen (*Tylenol*) has been proposed as an aspirin substitute, but this drug also has the same effect as its analog, aspirin.

The broad-spectrum antibiotics and sulfas, by depressing the vitamin K producing intestinal flora, tend to have this potentiating effect, but only occasionally to a striking degree.

Clofibrate (*Atromid-S*) usually strikingly prolongs the prothrombin time in the presence of warfarin. Therefore, the anticoagulant dose ought to be lowered by approximately 50% until the actual effect has been observed over a few weeks period, during which time the prothrombin time is measured at least weekly. This drug plus d-thyroxine and the anabolic steroid, norethandrolone, increase the effect of the coumarins apparently by altering the receptor sites for the drug, since serum levels are not increased or prolonged. Cortisone usually potentiates the coumarins. Phenramidol HCl (*Analexin*) was one of the earliest drugs noted to have this effect.

Phenylbutazone (*Butazolidin*) and oxyphenbutazone (*Tandearil*) are very frequently encountered problem drugs in this regard and reliably and strikingly affect the prothrombin time in the presence of warfarin. Phenylbutazone decreases the plasma half-life of warfarin by decreasing plasma binding and, in the process, makes more warfarin available for receptor sites, thus prolonging the prothrombin time.

Heparin, especially when given I.V., prolongs the prothrombin time just as warfarin, to some extent, prolongs the clotting time. However, the effect of heparin on the one-stage prothrombin time is of short duration, a fact which is useful in switching from heparin to oral anticoagulants. Peak prothrombin times occur at one to two hours after an I.V.

dose of heparin and quickly taper off to baseline levels by about four hours. Heparin given subcutaneously does not so noticeably affect the prothrombin time. Depending upon when blood is drawn for prothrombin determinations in relation to the time of administration of heparin, the prothrombin time obtained may be more a reflection of heparin activity than of coumarin activity, whereas a blood sample drawn a few hours later would reflect almost entirely coumarin activity.

Quinidine in some persons acts synergistically with oral anticoagulants to prolong the prothrombin time. There are several reports of this effect in the literature. It is probably uncommon, but certainly ought to be remembered in view of the frequent concomitant use of these drugs.

Drugs Which Diminish Sensitivity to Coumarins

Drugs which diminish sensitivity to coumarins are in widespread use. Vitamin K is a direct antagonist and hardly needs to be mentioned.

Some barbiturates, especially phenobarbital, increase the rate of coumarin metabolism by hepatic microsomal enzymes by the process of enzyme induction. This increases the amount of anticoagulant drug needed to achieve a given prothrombin time prolongation. An individual may require up to 33% more warfarin while taking 30 mg of phenobarbital Q.I.D. In the presence of phenobarbital, plasma coumarin levels are lower and thus it is inferred that increased metabolism is responsible for this effect. Secobarbital, on the other hand, has been shown not to have this enzyme stimulating affect.

It is interesting that other non-barbiturate hypnotics also have recently been shown to have the same effect, namely, glutethamide and chloral hydrate and its derivative, chloral betaine. However, chloral betaine, although it decreases plasma half-life of warfarin to a mild degree, does not very appreciably affect the prothrombin time. It is useful to note that, at least with phenobarbital, this phenomenon may take a week or more to first appear and may last for up to six weeks after this drug is discontinued. There is one recent report of hemorrhage associated with prolonged prothrombin time in an individual on bishydroxycoumarin, resulting when chloral hydrate was discontinued but the anticoagulant continued at the previous dose.

In summary, there are a variety of factors which affect an individual's prothrombin response to oral anticoagulants. One of the major factors is the concomitant use of other drugs. Whenever an individual is taking one of the oral anticoagulants, that is a coumarin or indandione (eg, *Miradon*) drug, particularly on a long term basis, it is necessary to monitor closely the use of other drugs. This is especially true when the anticoagulation is maintained by another physician.

KURT GORWITZ, ScD, STATISTICS DIRECTOR

Maryland State department of mental hygiene

A Report to the Fifteen Southern States*

Hospital services for the mentally ill in the Southern states have progressed substantially in recent years. Statistics published by the Office of Biometrics of the National Institute of Mental Health, show that despite this marked improvement the Southern states continue to lag appreciably behind the rest of the United States. The net difference in average daily per patient expenditure is now higher than it has been at any time previously, while the ratio of employees to patients continues to lag appreciably.

Average Daily Per Patient Expenditure	15 Southern States	Rest of United States	Net Difference	Percent Difference
1958	$2.87	$4.42	$1.55	– 35.1
1963	4.16	6.33	2.17	– 34.3
1967	6.43	9.68	3.25	– 33.6
1968	7.76	11.41	3.65	– 32.0
Number of Employees For Every 100 Patients				
1958	25.3	32.8	7.5	– 22.8
1963	33.1	39.6	6.5	– 16.4
1967	42.0	52.7	10.7	– 20.3
1968	46.1	54.9	8.8	– 16.0

Total hospital maintenance expenditures by the 15 states more than doubled in this ten-year period (from $139,000,000 in 1958 to $310,000,000 in 1968) and average daily per patient expenditures are now two and one-half times the 1958 figure. However, since comparable changes have occurred in the other 35 states, the South's relative position has remained essentially unchanged. In fact, the South's daily average in 1968 of $7.76 was exceeded by 10% or more by all except one of the other 35 states. The seven states with lowest per patient expenditures were all in the South. Arkansas, which had the highest per patient per day cost among Southern states ($13.93), ranked fifteenth nationwide. Related to this, the average size of the patient population declined 18.1% (from 133,198 to 109,073) in the Southern states during this ten-year span while the comparable figure for the rest of the country was 26.5% (from 413,139 to 303,745).

This disparity does not reflect a lesser interest and support for mental hospital programs. Rather, it is directly related to the relatively lower economic level of most Southern states. Latest figures released by the U.S. Department of Commerce indicate that per capita income in the South continues to be one fourth lower than in the rest of the United States. This in turn has produced lower than average per capita expenditures for all state services.

The South has been characterized as an area in transition. Gradual economic and social development can be expected to produce in the mental health field a concomitant continuation of the progress experienced in recent years. However, it must be recognized that unless this is rapidly accelerated, much of the South will perpetually continue to lag appreciably behind the rest of the United States.

THE MONTH IN WASHINGTON

A Food and Drug Administration advisory committee found oral contraceptives to be "safe," but reported that British and U.S. studies had established "an etiologic relation between thromboembolic disorders" and their use.

The Advisory Committee on Obstetrics and Gynecology, making its second report on oral contraceptives, said that their benefits outweighed the risks sufficiently to designate them "safe" within the intent of the federal law.

As for the potential carcinogeneity of oral contraceptives, the report said no conclusion could be drawn at this time.

The committee called for intensive research along three lines: ● possible relationship of hormonal contraceptives and carcinoma of the breast and uterus; ● determination of the basis and prognosis of metabolic alterations produced by hormonal contraceptives, and ● development of new methods of contraception.

The committee, in its initial report, three years ago, approved of oral contraceptives with reservations. It now said that these reservations appear to have been justified because of the adverse reactions reported in both scientific literature and the general press. But the report concluded:

"When these potential hazards and the value of the drugs are balanced, the committee finds the ratio of benefit to risk sufficiently high to justify the designation safe within the intent of the legislation (Kefauver-Harris Amendments of 1962)."

The report said scientific studies "suggest that the mortality from thromboembolic disorders attributable to the oral contraceptives is about three per 100,000 women per year, adding less than 3% to the total age-specific mortality in users of these drugs." In a U.S. study, the risk of thromboembolism to a woman using hormonal contraceptives was estimated by indirect methods to be 4.4 times that of a nonuser.

It was stated in the report there is no evidence that any metabolic alterations induced by the oral contraceptives pose serious health hazards.

The effectiveness of oral contraceptives was found to be significantly higher than for intrauterine devices or traditional methods.

* * *

Abandoning a long court fight, **the Internal Revenue Service reversed itself and ruled that organizations of physicians authorized under state professional association laws will be treated as corporations for tax purposes.**

The IRS announced that it would not appeal to the Supreme Court two recent decisions by U.S. courts of appeal favoring the professional association. In accordance with these court decisions, the IRS said, "organizations of doctors, lawyers and other professional people organized under state professional association acts will, generally, be treated as corporations for tax purposes."

Forty-two states have such laws which offer tax benefits, including deferment of the tax on pension plan contributions until retirement.

The court controversy over IRS treatment of the professional associations for tax purposes dates back to the early 1950's. It was given a "Kintner" label in 1954 when an appeals court ruled in favor of the professionals in a case brought by Arthur Kintner, MD, Missoula, Montana.

* * *

The federal government has started a program designed to increase enrollment in the nation's schools of medicine and osteopathy by 4,000 over the next four years.

Known as the **Physician Augmentation Program,** the activity, under the Department of Health, Education and Welfare, supports the addition of 1,000 first-year places commencing with the fall term of 1970. These places are in addition to any increase to which the schools have already committed themselves. Total enrollment through this program is expected to be about 4,000 in the fourth year of operation. The Physician Augmentation Program is authorized under the Health Manpower Act of 1968.

Grants will be awarded on a national competitive basis to those schools of medicine and osteopathy that document their intention to institute a major increase in their first-year enrollment and that appear to have the greatest potential for achieving major increases with their own resources as supplemented by funds allocated by the program.

* * *

Robert H. Finch, secretary of Health, Education and Welfare,

proposed that state medicaid administrators work more closely with state medical societies on cost control in the federal-state health care program.

He also said that the states should review more claims in efforts to control medicaid costs.

Finch gave his views on controlling medicaid costs in a letter to Sen. Abraham Ribicoff (D., Conn.) who had asked what was being done and what additionally could be done about rising expenditures in the program.

In answer to a question as to what states "could be doing under existing law to control medicaid costs more efficiently," Finch said:

"One answer is to spend more money on the claims review function. For example, there are two states where annual medicaid expenditures are in excess of one hundred million dollars. One employs 7 people for its review function, the other employs 70. The latter state has very effective control over costs and utilization.

"But I am coming to believe that a major factor is the degree to which physicians are involved in the program, not simply as purveyors of medical care but also as watchdogs of costs and guardians of quality. They generate the bulk of medicaid expenditures. They authorize admissions to hospitals and skilled nursing homes and they write prescriptions. The need for genuine physician participation in controlling costs is self-evident. A state medicaid administrator would be well advised to make extensive use of his medical advisory committee and to engineer the plan in detail through the state medical society."

As to what states already are doing, Finch said:

"Some states are using prior authorization of service (emergencies excepted). Some use fee schedules. Some use audit tolerance levels. Some incorporate parameters of medical care into their data processing systems. Some develop client and purveyor profiles. Some use computers to process claims. Others contract the review function to a fiscal agent, eg, a Blue Cross plan. Some use a medical audit and some have been doing very little."

Ribicoff said in his letter to Finch that he understood "there is very uneven performances of medicaid program review throughout the nation."

Peer review, under leadership of state and county medical societies, has top priority in the American Medical Association recommendations for controlling costs in both medicaid and medicare. A report of the AMA board of trustees approved by the house of delegates at the 1969 annual convention in New York strongly urged that:

—"Peer review be assigned the highest priority by the

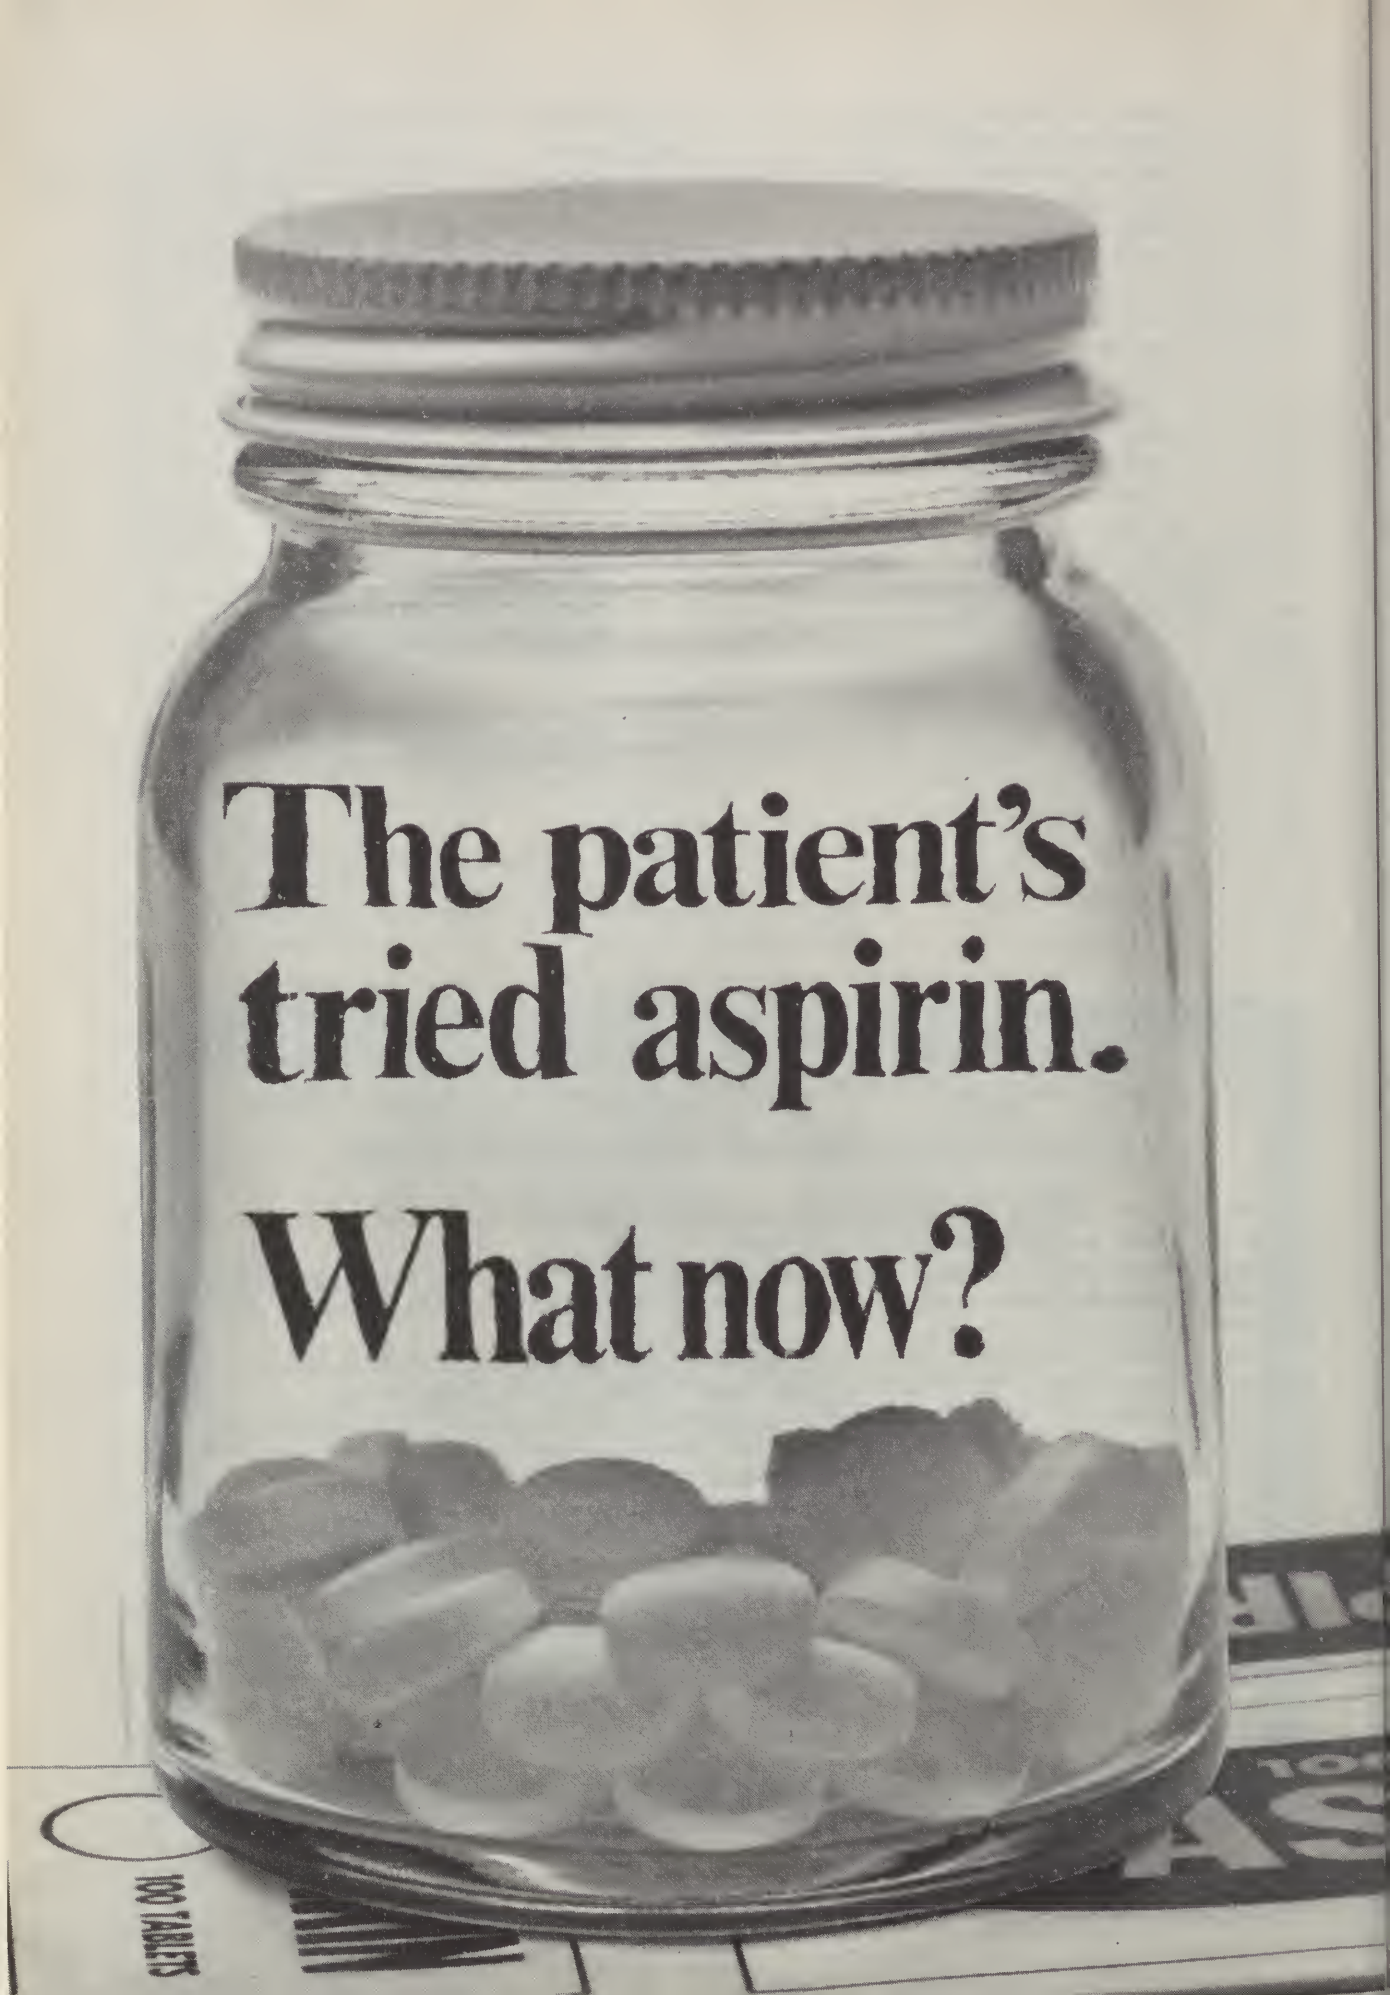
AN ANNOUNCEMENT TO MARYLAND PHYSICIANS WHOSE PATIENTS HAVE CHRONIC SLEEP DISTURBANCE

Recent advances in sleep research have made it possible to measure a variety of sleep disorders in otherwise normal patients.

To further these studies a clinic is being established at the Maryland State Psychiatric Research Center under the direction of Dr. Clinton Brown, Chief of Basic Sciences Research.

The primary purpose of this clinic will be to investigate the variables producing insomnia so that more effective treatment approaches may be formulated.

Of interest are: 1) the personality configuration, 2) sleeping habits and 3) psychophysiologic reactivity of the patient with chronic complaints of inability to fall asleep, frequent or early awakenings, somnambulism, enuresis or nightmares.



Individuals accepted for study will be given a physical exam, interview, psychometric test and polygraph recordings obtained during sleep.

Patients will be accepted by referral only and a diagnostic report will be furnished to the referring physician at the conclusion of the study.

Partial support for this project is being furnished by Friends of Psychiatric Research, a non-profit research foundation. While fees will not be charged, voluntary contributions by patients to offset study costs will be welcomed.

Additional information or appointment may be obtained by calling Mrs. Zaborowski at 744-8700, Ext. 252, 10 A.M. to 4 P.M. Monday thru Friday.

Albert A. Kurland, M.D., Superintendent.

The patient's
tried aspirin.
What now?
100 TABLETS

There's a good chance your patient needs more than a non-prescription analgesic for pain relief. Especially after self-medication has failed.

Because continuing, increased pain and discomfort may in part be a reflection of anxiety, Equagesic is worthy of consideration. In a single, non-narcotic preparation, it helps relieve pain . . . *and* associated anxiety and tension.

Tablets

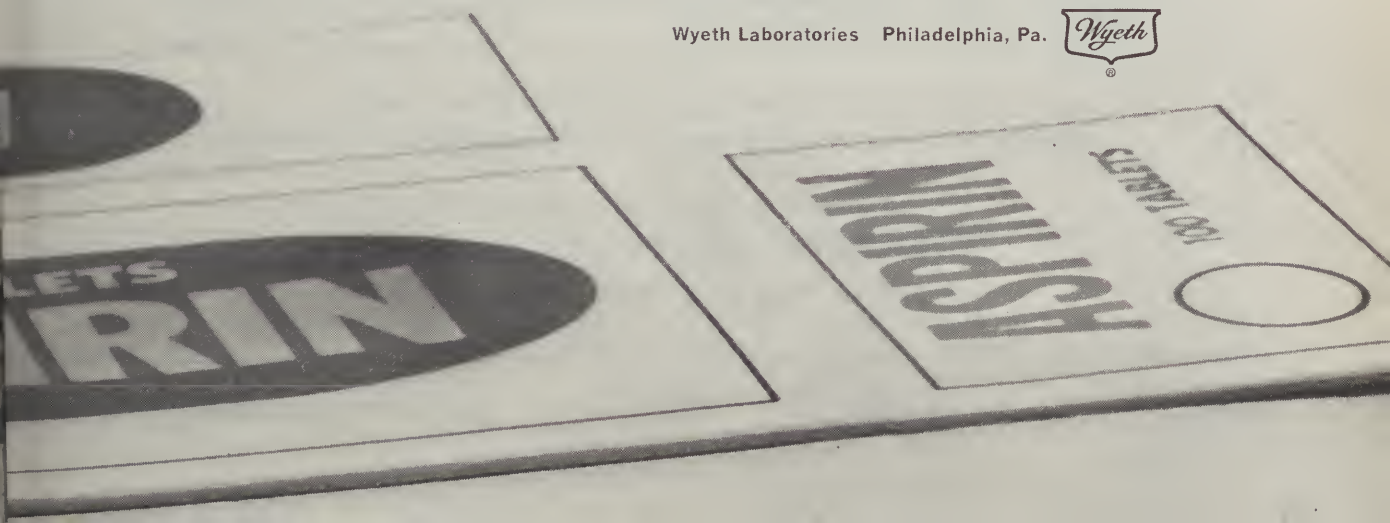
Equagesic®

(meprobamate and ethoheptazine citrate with aspirin) Wyeth

IN BRIEF

Contraindications: History of sensitivity or severe intolerance to aspirin, meprobamate or ethoheptazine citrate.

Warnings: USE IN PREGNANCY: Safety for use during pregnancy or lactation has not been established; therefore, it should be used in pregnant patients or women of child-bearing age only when the physician judges its use essential to the patient's welfare.



Precautions: Keep out of reach of children. Not recommended for patients 12 years old or less. Carefully supervise dose and amounts prescribed, especially for patients prone to overdose themselves. Excessive prolonged use of meprobamate in susceptible persons—as alcoholics, ex-addicts, severe psychoneurotics—has resulted in dependence or habituation. Withdraw gradually after prolonged excessive dosage to avoid possibly severe withdrawal reactions including epileptiform seizures. Warn patients of possible reduced alcohol tolerance, with resultant slowed reactions and impaired judgment and coordination. If drowsiness, ataxia or visual disturbances (impairment of accommodation and visual acuity) occur, reduce dose. If symptoms persist, patients should not operate machinery or drive. After meprobamate overdose, prompt sleep, reduction of blood pressure, pulse and respiratory rates to basal levels, and hyperventilation are reported. Give cautiously and in small amounts to patients with suicidal tendencies. Treat attempted suicide (has resulted in coma, shock, vasomotor and respiratory collapse and anuria) with gastric lavage and appropriate symptomatic therapy (CNS stimulants and pressor amines as indicated). Two instances of accidental or intentional significant overdosage with ethoheptazine and aspirin have been reported. These were accompanied by CNS depression (drowsiness and lightheadedness) but resulted in uneventful recovery. On basis of pharmacologic data, CNS stimulation could be anticipated, with nausea, vomiting and salicylate intoxication (requires induced vomiting or gastric lavage, specific parenteral electrolyte therapy for ketoacidosis and dehydration, and observation for hypoprothrombinemic hemorrhage [usually requires whole blood transfusions]).

Adverse Reactions: Ethoheptazine and aspirin may cause nausea with or without vomiting and epigastric distress in a small percentage of patients. Dizziness is rare at recommended dosage. Meprobamate may cause drowsiness, ataxia and rarely allergic or idiosyncratic reactions. These reactions, sometimes severe, can develop in patients receiving only 1 to 4 doses. Such patients may have had no previous contact with meprobamate and may or may not have an allergic history. Mild reactions are characterized by urticarial or erythematous maculopapular rash. Acute nonthrombocytopenic purpura with cutaneous petechiae, ecchymoses, peripheral edema and fever have been reported. If allergic reaction occurs, discontinue meprobamate; do not reinstitute. Severe reactions, observed very rarely, include fever, fainting spells, angioneurotic edema, bronchial spasms, hypotensive crises (1 fatal case), anaphylaxis, stomatitis and proctitis (1 case) and hyperthermia. These cases should be treated symptomatically including, when indicated, such medication as epinephrine, antihistamine and possibly hydrocortisone. A few cases of leukopenia, usually transient, have been reported on continuous use. Rarely, aplastic anemia (1 fatal case), thrombocytopenic purpura, agranulocytosis, and hemolytic anemia have been reported, almost always in presence of known toxic agents.

Overdosage: See precautions section for management of overdosage.

Composition: 150 mg. meprobamate, 75 mg. ethoheptazine citrate and 250 mg. aspirin per tablet.

HIGHLAND HOSPITAL

Asheville, North Carolina
Founded 1904

A DIVISION OF THE DEPARTMENT OF PSYCHIATRY OF DUKE UNIVERSITY

Accredited by the Joint Commission on Accreditation and Certified for Medicare

Complete facilities for evaluation and intensive treatment of psychiatric patients, including individual psychotherapy, group therapy, psychodrama, electro-convulsive therapy, Indoklon convulsive therapy, drugs, social services work with families, family therapy, and an extensive and well organized activities program, including occupational therapy, art therapy, music therapy, athletic activities and games, recreational activities and outings. The treatment program of each patient is carefully supervised in order that the therapeutic needs of each patient may be realized.
High school facilities for a limited number of appropriate patients are now available on grounds. The School Program is fully integrated into the hospital treatment program and is accredited through the Asheville School System.
Complete modern facilities with 85 acres of landscaped and wooded grounds in the city of Asheville.

Rehabilitation of Spinal Cord Injured Patients

Part I: General Introduction

FLORENCE I. MAHONEY, MD
Chief, Physical Medicine and Rehabilitation Service
Veterans Administration Hospital, Baltimore
Formerly Director, Rehabilitation Medicine
Chronic Disease Hospitals
Maryland State Department of Health

Prior to World War II, the outlook for survival of spinal cord injured patients was indeed dim. This condition was described in what is believed to be the oldest medical textbook, "The Edwin Smith Surgical Papyrus", as follows:

"Thou shouldst say concerning him; One having a dislocation in the vertebra of his neck while he is unconscious of his two legs and his two arms and his urine dribbles. An ailment not to be treated." [1]

Management of spinal cord injury patients did not improve appreciably until World War II. During the Balkan Wars of 1912-13, mortality within a few weeks of injury was 95%. The large number of paraplegics, resulting from gunshot wounds, following World War I stimulated both the professional and public concern about these helpless veterans. An estimate of paraplegic mortality among British soldiers during the war was 80%; 47% of the deaths occurred in the first six weeks following injury.[1] The principle cause of death, as it is today, was due to complications of ascending urinary tract infections and decubitus ulcers.

When antibacterial therapy was discovered, the survival rate of the spinal cord injured patient increased. It was at this time that interest developed in the care of these patients. At first the clinical interest was in the care of the urinary tract infections and complications, prevention and care of decubitus ulcers, spasticity, pain, and what was then called myositis ossificans, but is now usually referred to as heterotopic ossification. Very soon the physical rehabilitation of these patients became a part of their comprehensive care since the functional capacity of the patient to care for himself was a major problem.

Thus, during World War II, considerable interest developed in the rehabilitation of the spinal cord injured patient. Munro, one of the early workers in this country, stated in 1945 that: "if he has been properly treated, every patient who has a spinal cord

In the next issues, we will have several articles on spinal cord injuries. The number of such injuries is gradually increasing with the increasing number of automobile accidents, bullet wounds, and other traumatic accidents of an industrial society. We are fortunate to have Dr. Florence Mahoney start off the series since she has had long experience with this condition and was one of the first doctors in Maryland to accumulate experience with a large number of these patients.

or cauda equina injury, who is intelligent and cooperative, and who has the use of the shoulder, arm, and hand muscles can be made ambulatory; can have such control of the bladder and bowels as to sleep through the night without either getting up or wetting himself; and carry out ordinary activities throughout the day without soiling himself with feces or having to evacuate his bowel oftener than every three hours; lead a normal social life, and within the limits of his intellectual capacity, can earn a satisfactory living." [2] Dr. Munro also emphasized the importance of team work between various physicians and surgeons, as well as nurses, physical therapists and social workers as being necessary to accomplish this goal with such patients.[3] He strongly urged that one physician should assume control of, and responsibility for, the over-all care, suggesting that "the one most enthusiastic, willing to give the necessary time, has the best general knowledge of the problems involved, and is willing to watch constantly the small details of therapy" should be in charge.

There has been considerable clinical study and development of the teamwork necessary to rehabilitate these patients since that time. In this country, some of the earliest work to develop techniques of activities of daily living (ADL) and ambulation was done by Dr. George Deaver of New York, who has been called the "Father of Modern Rehabilitation." [4] Following World War II, a number of paraplegic centers were established across the country in Veterans Administration hospitals. Many of the early studies were done in these centers by Bors, Comarr, Talbot and others, as well as Guttman in England. The Veterans Administration has published a selected bibliography on this subject covering the major publications from 1940-1963 [5] and a supplement covering papers written from 1964-1965.[6] A perusal of these volumes indicate the early emphasis on clinical problems, the development of the rehabilitation techniques, and the preserving of what was practical and useful as time went on. During the 1950's and 1960's, many rehabilitation centers and departments of physical medicine and rehabilitation or rehabilitation medicine have been developed in medical schools and hospitals. In these centers, spinal cord injured patients have been successfully treated with the end result of improvement of physical and mental health, and a return to society and useful work. Along with the improvement in treatment and rehabilitation techniques, more physicians have been attracted to the specialty of physical medicine and rehabilitation, and physical therapists, occupational therapists, nurses and social workers have developed a greater understanding of the total problem in treating patients with this catastrophic problem.

During this period of development of the specialty of rehabilitation, it has been learned that much can be done for the quadraplegic patient. Patients with cervical injuries at the level of C-6, who have paralyzed hands but preservation of the muscle power of sufficient strength in the trapezius, deltoid, pectoralis major (or at least a portion of it), biceps and radial wrist extensors, have been trained to be completely independent in a wheelchair. These patients can live at home without the help of a second person. With a few adaptations to the home, they are able to care for their bowels and bladder without help, take a shower, move in and out of bed, on and off the toilet, and in and out of a car, dress themselves completely, and even work in a place into which they can get their wheelchair. They can be bowel and bladder trained so that they will not soil themselves and can care for the colostomy bag if they have had a urinary diversion operation. They can write and type with a simple device which they can carry in their pocket and put on without assistance. No devices are needed for feeding or dressing. Four such patients (who were trained at Montebello State Hospital) are working in the Maryland State Office Building.

Some rehabilitation centers have been developing complicated assistive devices for quadraplegics with high lesions so that they can do a few things for themselves, such as feeding, wheeling a chair (electric or hand propelled), and writing. These assistive devices are used mainly for patients with too little muscle power to do these things in any other way.[7]

If successful rehabilitation is to be accomplished without unnecessary complications, care must be taken at the time of the accident and in the acute hospital. Patients must be handled properly at the time of the accident and in the emergency room to prevent further injury at the site of the injury.[8] In the operating room, and while the patient is in the acute hospital, care must be taken to prevent decubitus ulcers. Proper urological care must be instituted immediately to prevent unnecessary complications of the urinary tract.[9]

When the patient passes the acute state, he is usually transferred to a rehabilitation center or hospital, since he requires a highly sophisticated team, each of whom is well trained in the meticulous details of his specialty. Each member of the team needs to know the total problem of the patient, and all must work closely together under the direction of the physician in charge.

Factors Affecting the Final Goal in Rehabilitation

What can be accomplished with any given patient who has spinal cord injury will depend on three factors: 1. the amount of permanent damage done at the time of the accident; 2. the complications which develop contraindicating exercise; and, 3. the psychological response of the patient and his family to the catastrophic physical alteration.

Amount of Permanent Damage

Automobile accidents, falls, gunshot wounds, blows on the neck or back, and stab wounds are the most common causes of permanent injury. Most often, these injuries occur to young men—from the teen years to the early thirties.

The higher the lesion, the less independence the patient can achieve. If the injury is at C-4 and is complete, only the diaphragm is innervated from the cervical area. At C-5, the biceps and shoulder muscles are preserved. These patients will need nursing care, dressing and lifting, but the patient with a C-5 lesion should be able to put on his shirt, wash his face, comb his hair and feed himself, using assistive devices. Patients with lesions at C-6, as mentioned above, retain innervation of sufficient muscles to become independent in a wheelchair with proper training, no serious complications, and much patience on the part of the staff working with the patient. These patients, particularly if not obese, and if willing to invest themselves in the long tedious process, can return to society as a useful citizen. If they are bright and well motivated, they can be trained for a good job. Any patient with a cervical lesion below this level should become independent in all activities from a wheelchair with more ease, since he will have some innervation of the finger and thumb muscles. Those who have incomplete lesions vary in what they can accomplish depending on which muscles are preserved.

Lesions in the thoracic and lumbar area do not involve the brachial plexus and such patients should have no difficulty in becoming independent in a wheelchair. Those with lower thoracic or lumbar lesions can learn to ambulate with crutches and long leg braces as mentioned by Munro in his writing during the 1940's. However, few of them continue to walk after discharge from the rehabilitation center or hospital since the energy cost is too high. Those who continue ambulation are mostly thin, strong, young men who feel it is important to exercise, or those who have incomplete lesions and therefore some useful muscle power in the lower extremities. Those who go to work usually prefer to save their energy for this purpose.

Complications

Complications which most frequently interfere with these goals are decubitus ulcers and urinary tract infections. In some patients severe spasticity, heterotopic ossification and pain will be so severe as to interfere with rehabilitation. Body build, particularly obesity, may prove to be an added disability in the training of the patient.

Decubitus ulcers should be prevented from the time the patient is injured, through his acute hospital stay and during his rehabilitation. If they are allowed to develop, the rehabilitation time may be prolonged months to years.[10]

Urinary tract infections can be minimized if the physician who first sees the patient is well informed about the care of the neurogenic bladder and, therefore, treats it properly at the time of the accident and during the acute phase, and if the patient learns to drink plenty of fluids each day.[11] If the bladder remains atonic or reflux develops, he cannot be bladder trained, but must continue to wear a catheter. More recently the ileal loop bladder operation has been performed on some of these patients, especially if they have considerable and frequent trouble with urinary tract infections, reflux or an atonic bladder. According to Comarr, 80% of spinal cord injury patients can become catheter free within a year, and about two thirds of these can do so in six months after injury. However, he stresses that "the physician who cares for the neurogenic bladder must have patience. It requires time for a bladder to achieve balance so that an indwelling catheter can be removed permanently."[12] It is important to remember that the urological responsibility for the paraplegic and quadraplegic patient does not end when the patient is catheter free. At least yearly check-ups should be done on these patients if they are to keep well, since hydronephrosis, calculi of the kidneys or bladder or pathological changes in the urethra or genitalia may occur.

Obesity can be another disability in a spinal cord injured patient, since he needs to lift extra weight with fewer muscles. If the quadraplegic patient is short and stocky, it may prevent the independence that he might otherwise be able to attain. This is particularly true if he has short arms, even though he may have the necessary muscle innervation to expect independence in activities of daily living from a wheelchair.

Since most spinal cord injuries occur in young people, it is rare that heart disease and other medical problems preclude the necessary strenuous exercise to train the patient in activities of daily living. In older patients there may be medical complications which will make it impossible to do the activities necessary to allow independence.

A moderate amount of spasticity is helpful to the patient. It will assist him in activities of daily living and assist with emptying of the bladder. If spasticity becomes severe, the patient may go into extension or flexion as he attempts to move, and thus interfere with training in activities of daily living. If decubitus ulcers are allowed to develop, spasticity will be more severe, since ulcers are a strong stimulus to facilitation.

The etiology and pathology of osteoporosis is not understood. It becomes a problem in this type of patient when it is severe. The development of heterotopic ossification sometimes becomes a severe handicap in rehabilitation which challenges the orthopedist.

Psychological Factors

One of the most important factors in the rehabilitation of patients with spinal cord injuries is the psychological reaction of the patient and his family to this catastrophic and sudden change in his life, which has rendered him unable to move about normally, unable to feel below the level of the lesion and unable to control his bowels and bladder. All who work with these patients must understand the importance of focusing attention on a psychologically impaired person as well as a paralyzed patient. How the patient and family react to this severe loss depends in a large part on how they have learned to cope with life's many problems and the interaction of the patient's self-image and the response of others to him.[12] As rehabilitation techniques have developed and the care of the paraplegic and quadraplegic has improved, it has become increasingly evident that the treatment program should be further amplified with more meaningful understanding of the psychological and social problems which these patients face. As a result, rehabilitation centers have added psychological and psychiatric services to their staff and social service is an essential part of the team as well. In the acute phase there is a normal depressive reaction during which time the patient is assessing his loss, shifting his thinking, and evaluating what he has left with which to work. At this time he needs the greatest understanding and support by the nursing service in order to prevent decubitus ulcers, force his fluids, even at times to eat his meals. As soon as the patient can be up in a wheelchair and start learning activities and get around the hospital in his wheelchair, he begins to take a more realistic view of what he can expect to attain through rehabilitation. While he is still bedridden this is usually impossible for him, and he will talk about very unrealistic goals. It usually does little good to work out final goals for a patient until he has worked at ADL long enough to understand his assets and comes to grips with his rehabilitation activities. One need not be concerned with the early depression, except to give the proper psychological support and good medical care. However if the denial of disability persists, the patient will probably be a poor rehabilitation risk.

One must never underestimate the power of the helpless in dealing with these patients. Doctors, nurses, families and friends are easily threatened by the patient's inability to do things for himself, and the patient may learn quickly to manipulate all who work with him. It is for this reason that the patient does best in a rehabilitation setting working with a sophisticated team, all of whom are trained in the many facets of the spinal cord patient, and each a specialist in his particular part of the rehabilitation program. Firmness and understanding are part of the treatment. Communication between the various members of the team working with the patient help to bring this about, and assist the patient in finally learning his assets and working with them. Through good staff communication the team learns to distinguish between what the patient says and what he does, and thus avoids encouraging the patient to substitute what he calls "hope" for reality.

Summary

The care and rehabilitation of the spinal cord injured patient is a lifelong, meticulous and complicated procedure. It involves a thorough understanding of all the medical, rehabilitation and psycho-social problems on the part of the physician in charge and his team of ancillary personnel as well as the full cooperation of the patient if he is to reach his highest goal of physical, social and vocational rehabilitation. During the rehabilitation process the patient often grows to a more mature approach to living, in which case he takes care of himself without unnecessary help, prevents complications or at least minimizes them, manages his bowels and bladder with only rare accidents, and leads a normal social life within the limits of his disability. If he is intelligent and well motivated, he retrains for a new job if necessary and works. The physical rehabilitation is probably the most easily accomplished. Psychological adjustment and social and vocational rehabilitation are more difficult for many of these patients and usually requires a longer time.[13]

HELP!

Recently the American Hospital Association published results of a hospital library survey, which showed the following data concerning the need for more space in library quarters all over the nation.

Projections from the National Hospital Panel Survey
February, 1969

	Number of Hospitals	Number of Beds	Current Library Sq. Ft.	Library Square Feet Needed in 1970	Net Square Feet Increase
All Community Hospitals	5,872	772,503	4,652,225	6,223,606	1,571,381
Hospital Size					
6-24 beds	547	9,090	16,946	21,196	4,250
25-49 beds	1,439	51,350	172,087	238,384	66,297
50-99 beds	1,484	103,501	929,514	1,010,423	80,909
100-199 beds	1,139	158,467	1,019,442	1,284,540	265,098
200-299 beds	567	136,925	773,137	911,345	138,208
300-399 beds	302	102,482	440,326	735,354	295,028
400-499 beds	154	68,195	259,910	369,268	109,358
500+	240	142,493	1,040,863	1,653,096	612,233
Region					
New England	302	45,649	176,950	242,866	65,916
Middle Atlantic	698	159,340	703,445	927,789	224,344
South Atlantic	792	102,813	460,970	836,416	375,446
East North Central	930	154,180	547,118	851,589	304,471
East South Central	468	46,031	201,778	415,470	213,692
West North Central	774	77,100	878,175	1,052,268	174,093
West South Central	819	70,466	684,453	748,294	63,841
Mountain	347	29,480	46,000	74,950	28,950
Pacific	742	87,444	953,336	1,073,964	120,628

Physical space for housing personnel, as well as the book and journal collections, is the big problem in all libraries these days. The need is surpassed only by the lack of trained personnel to man the various positions necessary to operate libraries efficiently. Most medical libraries are forced to accept either untrained assistants or reduce services to their patrons. Usually, this means bibliographical effort is the first service to suffer, and in a library such as ours, serving an entire state, with physicians often unable to visit the library personally, such efforts are vital to satisfy the physicians' needs.

The Maryland area falls in the Middle Atlantic group which ranks third in net square feet increase needed by 1970. Fortunately, all new hospitals are planned to include some, if not always adequate, space for the medical staff and nursing school libraries. Others should provide enough footage and personnel to provide the maximum service possible under existing circumstances.

We know, we're caught in the squeeze like so many of our friends!

No injection after all!

This penicillin produces high, fast levels—orally.

Pen•Vee® K is usually so rapidly and completely absorbed that therapeutic penicillin levels are attained within 15 to 30 minutes. Thus it can often obviate the need for penicillin injections. The higher serum levels produced generally last longer than with those of oral penicillin G.

Indications: Infections susceptible to oral penicillin G: prophylaxis and treatment of streptococcal infections; treatment of pneumococcal, gonococcal, and susceptible staphylococcal infections; prophylaxis of rheumatic fever in patients with a previous history of the disease.
Contraindications: Infections caused by nonsusceptible organisms; history of penicillin sensitivity.
Warnings: Acute anaphylaxis (may prove fatal unless promptly controlled) is rare but more frequent in patients with previous penicillin sensitivity, bronchial asthma or other allergies. Resuscitative (epinephrine, aminophylline, pressor amines) and supportive (antihistamines, methylprednisolone sodium succinate) drugs should be readily available. Other rare hypersensitivity reactions include nephropathy, hemolytic anemia, leucopenia and thrombocytopenia. In suspected hypersensitivity, evaluation of renal and hematopoietic systems is recommended.
Precautions: In suspected staphylococcal infections, perform proper laboratory studies including sensitivity tests. If overgrowth of nonsusceptible organisms occurs (constant observation is essential), discontinue penicillin and take appropriate measures. Whenever allergic reactions occur, withdraw penicillin unless condition being treated is considered life threatening and amenable only to penicillin. Penicillin may delay or prevent appearance of primary syphilitic lesions. Gonorrhea patients suspected of concurrent syphilis should be tested serologically for at least 3 months. When lesions of primary syphilis are suspected, dark-field examination should precede use of penicillin. Treat beta-hemolytic streptococcal infections with full therapeutic dosage for at least 10 days to prevent rheumatic fever or glomerulonephritis. In staphylococcal infections, perform surgery as indicated.
Adverse Reactions: (Penicillin has significant index of sensitization): Skin rashes, ranging from maculopapular eruptions to exfoliative dermatitis; urticaria; serum sickness-like reactions, including chills, fever, edema, arthralgia and prostration. Severe and often fatal anaphylaxis has been reported (see "Warnings").
Composition: Tablets—125 mg. (200,000 units), 250 mg. (400,000 units), 500 mg. (800,000 units); Liquid—125 mg. (200,000 units) and 250 mg. (400,000 units) per 5 cc.

Licensed by the State of Md.

Now When You Recommend Moist Heat,

Recommend Automatic Moist Heat.

Until now, application of moist heat required boiling water, hot towels, and somebody to apply them. The Battle Creek THERMOPHORE changes all that. It provides instant and automatic moist heat, intensely hot, deeply penetrating.

The patient simply plugs it into an outlet. This unique hot fomentation pad then generates its own moisture from the air. Intensely hot moist heat is constantly maintained, and evenly distributed throughout the pad. No water is needed, no filling or emptying is required.

Large 13" x 27" pad covers back, or chest and abdomen, or both legs. Safety thermostat turns it off automatically, prevents overheating.

Price is **$35.00.** Also available in medium size 13 x 13 **$25.00.**

Developing Meaningful Mental Health Statistics

KURT GORWITZ, ScD
Statistics Director
Maryland State Department of Mental Hygiene

In 1841, Dr. William Farr published in the JOURNAL OF THE BRITISH STATISTICAL SOCIETY a paper entitled "The Mortality of Lunatics". Farr, a prolific and cogent writer who served for many years as Superintendent of the Statistical Department of England's Registrar General's office, is recognized as one of the pioneers in health statistics. His paper, based on a life-table technique, showed a clarity of language, an understanding of the subject matter, and a sophistication of analysis equalled only infrequently since that time.

With rare and notable exceptions, the field of mental health statistics today consists of a type of repetitive clerical bookkeeping limited to monitoring the flow of patients into, and out of, publicly operated mental hospitals. That is, data are generally collected and released for administrative purposes as a tool in the management of an agency's operations. The limitations of these statistics, together with their drab and dull manner of presentation, not only severely hinder potential research value and interest, but also conflict with communication between statisticians and other professional personnel.

As part of my doctoral dissertation in 1965,[1] I studied biostatistics programs in Canadian and United States schools of public health and surveyed operations of mental health statistics offices in each of the 50 U.S. states. An analysis of data through 1967 from public health schools is now in press.[2] I also conducted a survey of state mental health programs in 1967 and detailed findings will be released shortly.[3] In this latter survey, a majority, 28 of the 48 respondents, reported that during the preceding three years their staff had neither presented any papers at professional meetings nor published any papers in professional journals. The number of employees was small (a median of five) and most classified as clerical. Directors and others on their staffs rarely had undergraduate or graduate degrees in statistics. The average cost of maintaining these programs was less than $50,000 per year, or approximately 0.2% of total budgets for mental health services. Only 16 states collected data in one central office on patients in private psychiatric hospitals and outpatient psychiatric centers, in addition to public mental hospitals. The over-all impression was that the capability for measuring and evaluating current and new concepts and programs for the treatment of the mentally ill was largely nonexistent.

Reproduced from Canada's Mental Health, Bi-Monthly Journal of the Department of National Health and Welfare, Ottawa. Vol. XVII, No. 3, pp. 13-17. May-August 1969.

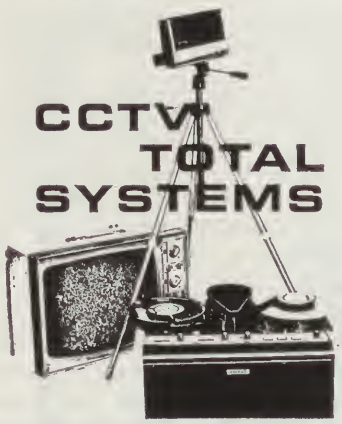
Current Deficiencies

A number of factors are responsible for these deficiencies. It is my distinct impression that one of the most important is the widespread lack of interest in, understanding of, and encouragement for statistical research on the part of mental health program directors. The noticeable absence of efforts to raise the level of statistical services indicates, I believe, that most administrators consider current programs to be acceptable and adequate. This, in turn, reflects the traditional position of many mental health program directors that their responsibility is limited to the administration of public facilities rather than to the broader role of supervising, directing and co-ordinating all programs related to mental health. Interrelated with this is the failure of those employed as statisticians to assume the initiative in developing more meaningful programs, in expanding research services and in presenting data in a professional and understandable manner. For example, although data based on the unduplicated count of individuals served in a given set of facilities during stated time periods are basic and relatively simple to obtain—even without the use of computers—such statistics are in fact virtually nonexistent. Rather, most reports are limited to counting treatment episodes instead of persons treated. This lack of sophistication, in turn, reflects deficiencies in training programs for statisticians, particularly in schools of public health.

The statistical field is caught up in a circle the various segments of which link to produce low level programs of dubious value. Educational institutions emphasize theoretical instead of applied statistics; in general, they fail to relate this knowledge to specific subject matter; and finally, they do not offer field

training. As a result, a minority of graduates, particularly those with advanced degrees, work in public health agencies. It should not be surprising, therefore, that the educational background of most persons designated as biostatisticians is in other areas, and that their experience in the mental health field is limited. Further, low salaries, limited levels of responsibility, and the repetitive clerical nature of their work have produced high employee turnover rates and low-quality staff. And this has been perpetuated by the failure of mental health program directors to seek better statistical services and to take the necessary corrective steps.

It is most important that the facts be clearly recognized and understood, and that basic decisions be reached as to whether or not existing program levels are acceptable. If they are not, as I firmly believe, a number of remedial actions are essential. In order for the circle to be broken, the impetus for change must come primarily from those now employed as mental health statisticians. Miss Brooke, in her article "Do Psychiatric Administrators Need Statisticians?", has detailed succinctly some of the steps necessary for producing meaningful mental health statistics. It is my belief that these efforts can be categorized into four broad areas:



1. Data must be based on uniform, centralized reporting from all inpatient and outpatient, both public and private psychiatric facilities, in order to measure the total extent of services.

2. Procedures must be established for unduplicating data in order to study cohorts of individuals over time; to analyze patterns and sequence of service utilization; and to evaluate the efficacy of various treatment modalities.

3. Data must be related to available population statistics for the computation of rates and determination of longitudinal trends.

4. Findings must be presented in a clear, concise and meaningful manner and should be distributed, or available, to all interested agencies and individuals. Wherever possible, associates in related fields (ie, psychiatry, psychology and sociology) should participate in special studies and in the analysis and interpretation of statistical data.

Biostatisticians have limited staff and time, and are notoriously overburdened with routine, repetitive work. It is essential that these responsibilities be re-evaluated and re-examined in order to eliminate needless effort and provide maximum time for more appropriate projects. Our experience has been that the goals referred to above are attainable. Maryland is in the process of achieving these objectives and, possibly, could serve as a model for other areas seek-

"Making Good Impressions Through Good Impressions"

ing to develop more meaningful mental health statistics.

The Maryland Department of Mental Hygiene, in co-operation with the National Institute of Mental Health, established a research program in July, 1961, known as the Maryland Psychiatric Case Register.[4] This project is based on routine, uniform reporting of data from more than 150 psychiatric facilities which provide almost 100% of such services to residents of the State. Confidentiality of individual patient information is assured by a state statute adopted in 1963. In the nearly eight years of its existence, more than 100,000 Marylanders (or 3% of the total population) have been identified as receiving psychiatric care. Currently, approximately 40,000 admissions of 30,000 individuals are reported annually to the Register. Of these, 10,000 are not known to have received previous care. Computerized techniques for maintaining and updating Register records have been developed and output has been primarily in four major areas; data used internally by the Department for the planning and evaluation of psychiatric services; routine reports, including a monthly statistics newsletter, which deals with a variety of mental topics (this newsletter is also published monthly in the state medical journal); a series of papers based on research findings presented at professional meetings and published in various professional journals—others are now in preparation; and finally, data used for research and management by staff of the participating facilities and by faculty members and students at The Johns Hopkins University School of Hygiene and Public Health and at The Johns Hopkins and University of Maryland Schools of Medicine.

Upgrading the Statisticians

It should be clear, however, that efforts by those presently employed as mental health statisticians to upgrade their programs can be only of limited value unless other corrective steps are also taken. Some of these, noted in random fashion, include:

1. Mental health program directors must consider statistics to be an integral, key part of their administrative and research structure. As such, statisticians should be expected to participate in and contribute to management decision-making and should also be expected to work with other researchers.

2. Salaries must be increased substantially in order to attract and retain competent personnel. Concomitantly, job requirements should be raised and the size of the statistical staff expanded. Provisions should be made for leave of absence, with pay and tuition reimbursement. for graduate or postgraduate study. Intra and inter-agency on-the-job training programs in statistics should be developed.

3. Administrators and professionals must be more knowledgeable in statistics. Therefore, curricula in the mental health professions should include required courses in applied statistics.

4. Schools of public health must put greater emphasis on applying statistics to health data. Health statisticians should be used as instructors, and mental health and other health data should be used for dissertations and other class projects. Field training should be mandatory for all students. Wherever possible, joint courses should be given by mental health and biostatistics departments.

The circumstances and conditions for developing comprehensive statistical programs are not likely to be as favorable elsewhere as they have been in Maryland. Our Register program, for example, has received a great deal of financial and technical support from the National Institute of Mental Health. Thus, while it may not be feasible at this time for many other states or Canadian provinces to develop data banks as comprehensive as those in Maryland, much could be done on a more limited scale by creative statisticians and with the present available means—if significant support were given. The experience gained in Maryland from our program could be helpful to others in these endeavors.

THE SWEETENER

Life can be sweet when you have a Baltimore Federal savings account, but Baltimore Federal Savings Certificates can be even sweeter! They start by earning interest at our current interest rate (paid by check at regular quarterly interest periods), then earn a bonus at maturity. You can invest from $1,000 to $11,000 in multiples of $1,000 for either six months or a year and earn a total rate of 5% per annum guaranteed! From $12,000 up, you can invest for either period and earn a guaranteed rate of 5¼% per annum.

Like our regular passbook savings account, your money is insured by the Federal Savings and Loan Insurance Corporation and further backed by Baltimore Federal's own reserves of over $25,000,000. Certificates may be cashed at any time, earning interest at our regular rates. Of course, for complete flexibility combined with high interest, many people still prefer our passbook accounts.

Save the way it suits you best . . . any of Baltimore Federal's five plans sweetens your savings with some very heavy sugar.

Two-Year Medical Assistant Curriculum Approved

Essentials of an accredited educational program for medical assistants received unanimous approval of the American Medical Association's House of Delegates at its July meeting in New York. This achievement marks the beginning of approved schools in medical assisting.

Established by the AMA's Council on Medical Education in collaboration with the American Association of Medical Assistants, the essentials will serve as a guide for the development of effective educational programs for medical assistants.

The essentials recommend that the two-year program be broad in scope, "providing a basic understanding of medicine, some acquaintance with clinical work, familiarity with medical ethics and law, and a comprehensive knowledge of how to operate a doctor's office efficiently and successfully." It suggests that the training should aim at developing adeptness in promoting good relations with patients and the public at large, and a capability for calm and reasoned judgments in meeting emergencies.

The basic curriculum is based on the AAMA certification study outline. Topics include anatomy and physiology; medical terminology; medical law, ethics, and economics; psychology; administrative and clinical procedures; and a basic knowledge of the purpose and technique of laboratory procedures commonly performed in the physician's office. A review and rotation sequence of practical experience in offices of qualified physicians or in accredited hospitals selected by the educational institution is also recommended.

While it will be several months before the AMA-AAMA team begins to evaluate schools, applications are being accepted by the AMA's Department of Allied Medical Professions and Services.

plan to attend the 23rd ama clinical convention denver, colorado·november 30-december 3,1969

A bustling skyscraper-studded cosmopolitan city, Denver, Colorado is western in character and dotted with sophisticated shops, superb restaurants, and theaters. And, just minutes away, the great Colorado Rockies — with forests, lakes and tumbling streams, internationally known ski areas, ghost towns, hunting and fishing.

As a general practitioner or specialist, you will find the Denver winter medical meeting a highly rewarding experience. Scientific Program Sessions, Breakfast Roundtable Conferences, Clinical Workshops, Panel Discussions, Television, Medical Motion Pictures, and hundreds of Scientific and Industrial Exhibits to show you the latest in equipment, services, and drugs are some of the means of keeping up-to-date in medicine.

Be sure to look for the complete scientific program, plus forms for advance registration and hotel accommodations in the October 20th issue of JAMA.

Information for Authors

MANUSCRIPTS: Manuscripts will be accepted for consideration for publication with the understanding that they are original, have never before been published, and are contributed solely to the Maryland State Medical Journal.

All manuscripts are acknowledged upon receipt and are followed up by notification of either acceptance or rejection. Rejected manuscripts are returned by regular mail. Accepted manuscripts become the property of the Journal and are not returned. The Journal is not responsible for loss of manuscripts through circumstances that are beyond its control.

Manuscripts should be addressed to: Editor, Maryland State Medical Journal, 1211 Cathedral St., Baltimore, Md. 21201.

SPECIFICATIONS: Manuscripts must be original typed copy, doublespaced throughout (Including text, case reports, legends, tables and references) with margins of at least 1½ inches. Pages should be numbered consecutively.

The manuscript should include the title (brief and concise), the full name of the author (or authors) with degrees, academic and professional titles, affiliations, and any institutional or other credits. Please include a complete address where the author may receive proofs of his article for his approval and corrections.

All manuscripts should be accompanied by a carbon or Xerox copy and the author should retain another copy for his records.

TABLES: Each table should be typed on a separate sheet of paper, be numbered, have a brief descriptive title, and its position in the text should be indicated.

Be sure that statistics are consistent in both tables and text.

REFERENCES: References should be limited to those citations noted in the text, and kept to a minimum of 18. (A complete review of the literature is rarely desirable.) The references must be typed, doublespaced, and are to be numbered consecutively as they appear in the text, with their positions in the text indicated. An alphabetized bibliography is used only when the listing is of books suggested for supplementary reading.

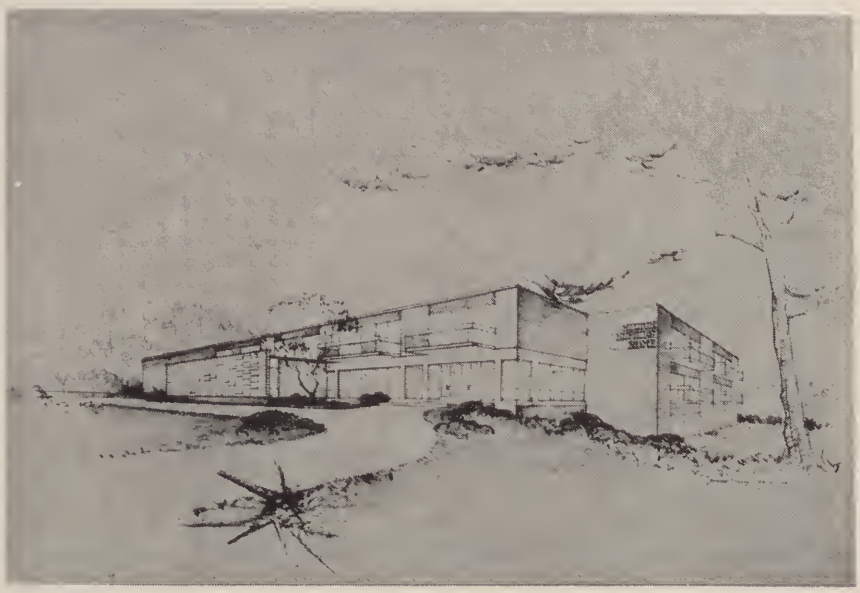
All references must be checked for absolute accuracy. Each journal reference must include author(s) and initials, complete title of article, name of publication, volume, first page of article, and date. Complete dates (month, day, and year) are to be included with all references that have appeared within the last three years. Include with book references name of author(s) and/or editor(s) with initials, title of book, edition, location, publisher, year, volume (if given), and page. If reference is to a chapter within a book, include the author of the chapter (if different from author of the book), and the title of the chapter, if any.

ILLUSTRATIONS: Authors are urged to use the services of professional illustrators and photographers when possible. Drawings and charts should always be done in black ink on white paper. Clear, glossy photographs, black on white, should be submitted and such illustrations numbered consecutively and their positions indicated in the text.

Magnifications will be modified in proportion to the amount of reduction necessary to fit the pages of the Journal. Please do not deface an illustration by writing on the front or the back, nor should it be taped or pasted to paper. The illustration may be pasted onto a piece of cardboard. Attached to the back of each illustration, chart or photograph should be the figure number. the author's name and the title of the article.

Legends for illustrations should be typewritten on a separate page with numbers corresponding to those on the photographs and drawings.

Recognizable photographs of patients are to be masked and should carry with them written permission for publication.



EDITORIAL RESPONSIBILITY: Manuscripts are subject to editorial modification and such revisions as are necessary to bring them into conformity with Journal style.

Statements made or opinions expressed by any contributor in any article or feature published in the Journal are the sole responsibility of the author.

PERMISSIONS: When material is reproduced from other sources, full credit must be given to both the author and publisher and written permission from these sources must be included when the material is submitted.

COPYRIGHT: Material that is published in the Maryland State Medical Journal is protected by copyright and may not be reproduced without the written permission of both the author and the Journal.

When disease is ruled out and psychic tension is implicated

Valium® (diazepam) helps relax the patient and relieve his somatic symptoms

Before prescribing, please consult complete product information, a summary of which follows:

Indications: Tension and anxiety states; somatic complaints which are concomitants of emotional factors; psychoneurotic states manifested by tension, anxiety, apprehension, fatigue, depressive symptoms or agitation; acute agitation, tremor, delirium tremens and hallucinosis due to acute alcohol withdrawal; adjunctively in skeletal muscle spasm due to reflex spasm to local pathology, spasticity caused by upper motor neuron disorders, athetosis, stiff-man syndrome, convulsive disorders (not for sole therapy).

Contraindicated: Known hypersensitivity to the drug. Children under 6 months of age. Acute narrow angle glaucoma.

Warnings: Not of value in psychotic patients. Caution against hazardous occupations requiring complete mental alertness. When used adjunctively in convulsive disorders, possibility of increase in frequency and/or severity of grand mal seizures may require increased dosage of standard anticonvulsant medication; abrupt withdrawal may be associated with temporary increase in frequency and/or severity of seizures. Advise against simultaneous ingestion of alcohol and other CNS depressants. Withdrawal symptoms have occurred following abrupt discontinuance. Keep addiction-prone individuals under careful surveillance because of their predisposition to habituation and dependence. In pregnancy, lactation or women of childbearing age, weigh potential benefit against possible hazard.

Precautions: If combined with other psychotropics or anticonvulsants, consider carefully pharmacology of agents employed. Usual precautions indicated in patients severely depressed, or with latent depression, or with suicidal tendencies. Observe usual precautions in impaired renal or hepatic function. Limit dosage to smallest effective amount in elderly and debilitated to preclude ataxia or oversedation.

Side Effects: Drowsiness, confusion, diplopia, hypotension, changes in libido, nausea, fatigue, depression, dysarthria, jaundice, skin rash, ataxia, constipation, headache, incontinence, changes in salivation, slurred speech, tremor, vertigo, urinary retention, blurred vision. Paradoxical reactions such as acute hyperexcitec states, anxiety, hallucinations, increased muscle spasticity, insomnia, rage, sleep disturbances, stimulation, have been reported; should these occur, discontinue drug. Isolated reports of neutropenia, jaundice; periodic blood counts and liver function tests advisable during long-term therapy.

LACTINEX®

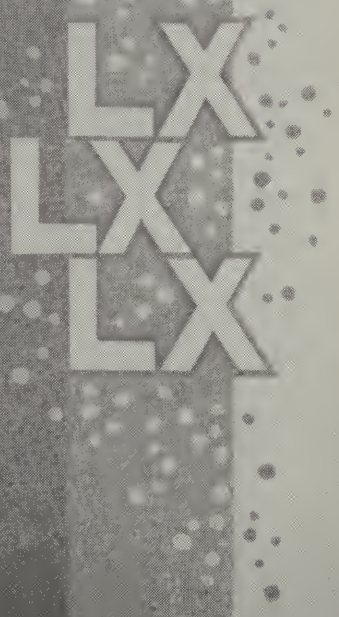
TABLETS & GRANULES

■ **to help restore and stabilize the intestinal flora**

■ **for fever blisters and canker sores of herpetic origin**

Lactinex contains both *Lactobacillus acidophilus* and *L. bulgaricus* in a standardized viable culture, with the naturally occurring metabolic products produced by these organisms.

Lactinex has been shown to be useful in the treatment of gastrointestinal disturbances, and for relieving the painful oral lesions of fever blisters and canker sores of herpetic origin.[1,2,3,4,5,6,7,8]



No untoward side effects have been reported to date.

Literature on indications and dosage available on request.

he may be a candidate for

DECLOSTATIN® 300

Demethylchlortetracycline HCl 300 mg and Nystatin 500,000 units CAPSULE-SHAPED TABLETS Lederle

b.i.d.

To guard susceptible patients against intestinal monilial overgrowth during broad-spectrum therapy—the protection of nystatin is combined with demethylchlortetracycline in DECLOSTATIN.

For your susceptible candidates, prescribe DECLOSTATIN—the broad-spectrum therapy that prevents monilial overgrowth.

Effectiveness: Because its antibacterial component is DECLOMYCIN Demethylchlortetracycline, DECLOSTATIN should be equally or more effective therapeutically than other tetracyclines in infections caused by tetracycline-sensitive organisms. The antifungal component, Nystatin, protects against superinfection by antibiotic-resistant fungal overgrowth (particularly monilia) in the intestinal tract.

Contraindication: History of hypersensitivity to demethylchlortetracycline or nystatin.

Warning: In renal impairment, usual doses may lead to excessive accumulation and liver toxicity. Under such conditions, lower than usual doses are indicated, and, if therapy is prolonged, serum level determinations may be advisable. A photodynamic reaction to natural or artificial sunlight has been observed. Small amounts of drug and short exposure may produce an exaggerated sunburn reaction which may range from erythema to severe skin manifestations. In a smaller proportion, photoallergic reactions have been reported. Patients should avoid direct exposure to sunlight and discontinue drug at the first evidence of skin discomfort. Necessary subsequent courses of treatment with tetracyclines should be carefully observed.

Precautions: Overgrowth of nonsusceptible organisms may occur. Di stant observation is essential. If new infections appear, appropri measures should be taken. In infants, increased intracranial pres with bulging fontanels has been observed. All signs and symptoms w disappeared rapidly upon cessation of treatment.

Side Effects: Gastrointestinal system—anorexia, nausea, vomiting, a rhea, stomatitis, glossitis, enterocolitis, pruritus ani. Skin—maculop ular and erythematous rashes; a rare case of exfoliative dermatitis been reported. Photosensitivity; onycholysis and discoloration of nails (rare). Kidney—rise in BUN, apparently dose related. Transi increase in urinary output, sometimes accompanied by thirst (re Hypersensitivity reactions—urticaria, angioneurotic edema, anaphyl Teeth—dental staining (yellow-brown) in children of mothers given t drug during the latter half of pregnancy, and in children given the d during the neonatal period, infancy and early childhood. Enamel h plasia has been seen in a few children. If adverse reaction or idio crasy occurs, discontinue medication and institute appropriate ther Demethylchlortetracycline may form a stable calcium complex in bone-forming tissue with no serious harmful effects reported thus in humans.

Average Adult Daily Dosage: 150 mg q.i.d. or 300 mg b.i.d. Should given 1 hour before or 2 hours after meals, since absorption is impa by the concomitant administration of high calcium content drugs, fo and some dairy products. Treatment of streptococcal infections sh continue for 10 days, even though symptoms have subsided.

Medical Journal

VOLUME 18 NOVEMBER 1969 NUMBER 11

CONTENTS:

Legalized Marijuana? 60

The Changing Status of Adolescents in the Modern World, Margaret Mead, PhD 61

"If we examine human development, as the human species became established as the species we know today, one of the most interesting developments has been the changing lengths of the various portions of the life cycle, as the period of early maturation was extended and human beings attained greater longevity. Among these developments, the postponement of puberty is one of the most important. This postponement allowed a longer period in which children, untroubled by the urgencies of puberty, could devote themselves to mastering the increasingly complex human culture. Today, children are reaching puberty at an earlier age, and the roles of children, young people, and adults in the present-day world are rapidly changing."

Cephaloridine Dosage in Infants and Children, Stuart H. Walker, MD, and Victoria T. Maisog, MD 65

"Cephaloridine, a semi-synthetic derivative of cephalosporin C, possesses the same range of antibacterial effectiveness as other cephalosporins, but produces less tissue reaction when injected intramuscularly, is less serum bound, possesses a longer serum half-life, and appears to penetrate the bacterial cell more rapidly. Cephaloridine has been demonstrated to be regularly effective in the treatment of gram-positive coccal infections, and less regularly effective in the treatment of gram-negative bacillary infections."

Sudden Unexpected Death in Infants, Gilbert E. Corrigan, MD, with a preface by Russell S. Fisher, MD 70

"Sudden unexpected death in infancy, or crib death, as it is frequently called, is responsible for nearly half of all deaths in infants between the ages of 3 weeks and 12 months. Although the examination of cytological specimens from the tissues and organs studied at autopsy is not a routine procedure, such an examination is made in cases of sudden unexpected death (SUD), since the results of such histological studies are often equivocal and debatable."

Season and the Onset of Acute Childhood Leukemia, James J. H. Carey, MD, and F. Robert Fekety, Jr., MD 73

"The hospital records of 96 children with leukemia seen at The Johns Hopkins Hospital were reviewed to determine whether there was any seasonal variation in the onset of the disease. By date of diagnosis, there was an excess of cases from June to September. By date of clinical onset, there was an excess of cases from May to August. Various artifactual causes of the phenomenon were considered, but were not supported. The seasonal variation was most prominent in children living in the Greater Baltimore Area, in Caucasians, in girls, in children with acute lymphocytic or stem-cell types of leukemia, and in children whose parents were less than 35 years old.

executive secretary's newsletter

November, 1969

ANNUAL MEETING RESOLUTIONS

Resolutions for consideration at the Annual Meeting of the House of Delegates, set for April 1, 2, 3, 1970 must be received in the Faculty Office

NO LATER THAN, FRIDAY, FEBRUARY 6, 1970

TRIENNIAL REGISTRATION

Triennial Registration for physicians is being handled on an alphabetical basis.

All registration notices for surnames beginning A through G were mailed in March of 1969 and any physician in this group who has not renewed his license will be considered as practicing invalidly. Surnames H through N will be mailed in March, 1970 and must be renewed by October, 1970; O through Z will be mailed in March, 1971 and must be renewed by October, 1971. Note: The current certificate is valid until the deadline date of your specific group.

SCIENTIFIC EXHIBITS 1970

Physicians interested in displaying a scientific exhibit at the Faculty's Annual Meeting, April 1, 2 and 3, 1970, should contact the Chairman of the Committee on Program and Arrangements, DeWitt E. DeLawter, MD, at the Faculty office. (See page 13 for form).

WE NEED YOUR HELP

Going into the mail to all members in the near future is a reply postal card asking for information on your desires as to committee assignments for the 1970-1971 Faculty year.

Only by letting the President-elect know of your willingness to serve on committees, can the most be obtained from the entire membership. By such service you can also get to know your society better and help solve the problems which are common to us all.

NEWS NOTES

Physicians, selected on a random basis, are to be asked by a questionnaire their "Attitudes Towards Nurse-Midwives". The survey is being conducted by a student at The Johns Hopkins School of Hygiene and Public Health, as material for his doctoral dissertation.

U.S. Department of HEW has 386 advisory committees consisting of 5,308 persons, such "advice" costing

NEWS
NOTES
(cont'd)

$7,093,290, this year. For fiscal 1971, a total of 5,514 persons are expected to "advise" at a cost of $7,225,487.

Cooperation between the medical profession and the new Secretary of Health and Mental Hygiene has reached one of the highest levels ever. Continuous communication on important health objectives results in finely-meshed activities and results.

Regional workshops have been scheduled for December in Philadelphia (9th) and New York City (11th) to discuss the Professional Activities Study and the Medical Audit Program now in use in many Maryland hospitals. Full details are available from the Faculty office.

The Study on Perinatal Mortality is getting into full swing with the mailing of material asking for contact person in all hospitals with obstetrical services. The ultimate aim is careful analysis of such deaths and development of educational activity to reduce the incidence.

Faculty committee members are working closely with members of the Podiatry Association in an evaluation of hospital privileges, and the Faculty's position in this regard.

Also hard at work are members of another subcommittee discussing the question of publicity efforts on the part of Maryland hospitals in their attempt to recruit patient for specialized research studies.

The Legislative program for the 1970 General Assembly is now being developed within the Legislative Committe While few Faculty-germinated items of legislation will be introduced, it is evident that legislators during the coming session will see increased emphasis on health matters.

The Secretary of Health and Mental Hygiene is developing ways and means to improve delivery of health care to recipients of Medicaid. The proposal is aimed at reducing the incidence of hospitalization, which is the single most expensive item in the Medicaid budget. Plans are underway for some type of peer review mechanisms for professional services, but with limited amount of data available from Medicaid program this is difficult to implement.

John Sargeant
Executive Secretary

Free your secretary for active duty.

You save precious secretarial time (and money) when your accounts receivable are handled electronically and expertly by Professional Systems and Services. In no time at all we teach your secretary to operate the compact IBM desk transmitter that speeds patient transactions to our data processing facility via commercial telephone lines. Then PS&S prepares and sends out your monthly statements and provides you with daily and monthly reports so that you and your accountant can keep accurate track of things. Speeds collections, too. Contact us now for a demonstration. And free your secretary to be your secretary again.

SCIENTIFIC EXHIBITS

The scientific exhibits are an integral part of the Annual Meeting of the Medical and Chirurgical Faculty. All physicians who have a scientific exhibit are urged to fill in the application below for the next Annual Meeting, which will be held

APRIL 1, 2, 3, 1970
The Alcazar, Baltimore

As space is limited, it is suggested that applications be submitted as soon as possible.

RULES GOVERNING SCIENTIFIC EXHIBITS

The following rules govern the selection and conduct of scientific exhibits:

1. Each exhibitor shall be fully responsible for the content, arrangement, presentation, setting up, and dismantling of his exhibit.
2. Cost of transportation of exhibit to and from the meeting must be borne by the exhibitor.
3. The Medical and Chirurgical Faculty will provide, without cost to the exhibitor, a backdrop and side rails for the booth, and 1000 watt electric current outlets.
4. MOTION AND SOUND MAY BE USED ONLY IF THEY DO NOT DETRACT FROM OTHER EXHIBITS, DISTURB THOSE IN ROOM, OR INTERFERE WITH TELEPHONES.
5. No reference to, or credit for, financial aid shall be shown on the exhibit.
6. Only generic names may be used, and shall not exceed one inch in height. NO TRADE NAMES are permissible.
7. Each exhibit should be manned at all times by someone thoroughly familiar with its content.
8. Exhibitors are urged to discuss their displays and work with the physicians and students.
9. The Medical and Chirurgical Faculty reserves the right to approve or reject any exhibit without recourse.

APPLICATION FOR SCIENTIFIC EXHIBIT SPACE

Fill in and mail to: Chairman, Exhibit Subcommittee
Medical and Chirurgical Faculty
1211 Cathedral Street, Baltimore, Md. 21201

1. Title of exhibit: _____

_____

2. Please attach a 50-100 word description of the exhibit: _____

3. Give amount of space required, depth, width, and height: _____

If exhibit has side panels, are depth and width included above? _____

If not, what additional space is required? _____

4. Electrical or other requirements: _____

_____

5. Has exhibit been shown at other medical meetings? _____

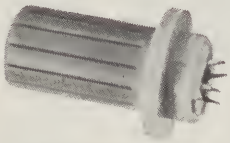
_____

6. Name and title of exhibitor: _____

_____

7. Name of institution cooperating in the exhibit: _____

_____



8. Address of exhibitor: _____

_____

The AMBAR® SCRAPBOOK of

Obesity Oddities

FACT & LEGEND

CONTROL FOOD AND MOOD ALL DAY LONG WITH A SINGLE MORNING DOSE

AMBAR #2 EXTENTABS®

methamphetamine HCl 15 mg., phenobarbital 64.8 mg. (1 gr.) (Warning: may be habit forming).

One Ambar Extentab before breakfast can help control most patients' appetite for up to 12 hours. Methamphetamine, the appetite suppressant, gently elevates mood and helps overcome dieting frustrations. Phenobarbital, the sedative in Ambar, controls irritability and anxiety... helps maintain a state of mental calm and equanimity. Both work together to ease the tensions that erode the willpower during periods of dieting.

Also available: Ambar #1 Extentabs®—methamphetamine hydrochloride 10 mg., phenobarbital 64.8 mg. (1 gr.) (Warning: may be habit forming).

BRIEF SUMMARY/**Indications:** Ambar suppresses appetite and helps offset emotional reactions to dieting. **Contraindications:** Hypersensitivity to barbiturates or sympathomimetics; patients with advanced renal or hepatic disease. **Precautions:** Administer with caution in the presence of cardiovascular disease or hypertension. **Side Effects:** Nervousness or excitement occasionally noted, but usually infrequent at recommended dosages. Slight drowsiness has been reported rarely. See package insert for further details.

A. H. ROBINS COMPANY, RICHMOND, VA. 23220 A·H·ROBINS

heavenly relief
for unearthly cough

Benylin®
EXPECTORANT

Each fluidounce contains: 80 mg. Benadryl® (diphenhydramine hydrochloride, Parke-Davis); 12 grains ammonium chloride; 5 grains sodium citrate; 2 grains chloroform; 1/10 grain menthol; and 5% alcohol.

An antitussive and expectorant for control of coughs due to colds or of allergic origin, BENYLIN EXPECTORANT is the leading cough preparation of its kind. BENYLIN EXPECTORANT tends to inhibit cough reflex... soothes irritated throat membranes. And its not-too-sweet, pleasant raspberry flavor makes BENYLIN EXPECTORANT easy to take.

PRECAUTIONS: Persons who have become drowsy on this or other antihistamine-containing drugs, or whose tolerance is not known, should not drive vehicles or engage in other activities requiring keen response while using this preparation. Hypnotics, sedatives, or tranquilizers if used with BENYLIN EXPECTORANT should be prescribed with caution because of possible additive effect. Diphenhydramine has an atropine-like action which should be considered when prescribing BENYLIN EXPECTORANT.

ADVERSE REACTIONS: Side reactions may affect the nervous, gastrointestinal, and cardiovascular systems. Drowsiness, dizziness, dryness of the mouth, nausea, nervousness, palpitation, and blurring of vision have been reported. Allergic reactions may occur.

PACKAGING: Bottles of 4 oz., 16 oz., and 1 gal.

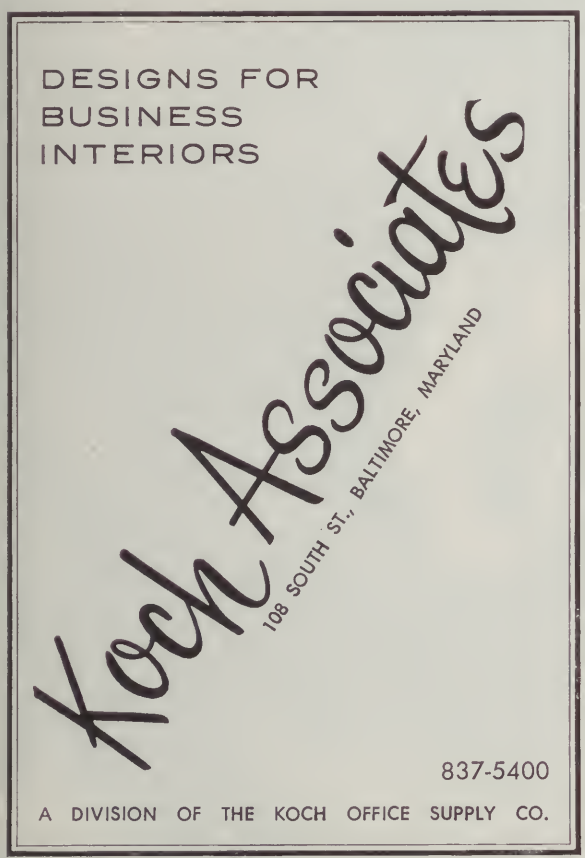
New Medicaid Regulations Set

The regulations on Medicaid payments, published in the Federal Register on July 1, establish a ceiling on government payments to physicians under the Title 19 program.

It does not reduce fees currently paid under Medicaid programs, and in certain cases allows states to increase payments if they have been substandard.

The regulations do, however, make use of a payment ceiling which will utilize the Consumer Price Index (CPI) to keep up with the changing economy.



The public had 30 days to comment on the regulations, which are summarized as follows:

1. Levels of Medicaid payment as of January 1, 1969, may not be exceeded.
2. States paying less than the 75th percentile of customary charges, based on data of January 1, 1969, may increase payments up to the 75th percentile as approved by the secretary.
3. If Medicaid payments, as of January 1, 1969, exceed the Medicare Part B level, payments must be reduced to the Medicaid level.
4. Increases after July 1, 1970, will be limited to the percentage increase in the all-services component of the CPI.
5. If on July 1, 1970, a state is paying at a level which is less than the 75th percentile (based on January 1, 1969 data), it may go to the 75th percentile, plus the increase in the CPI.
6. If on July 1, 1970, a state is paying at the 75th percentile, it may increase the payments based on the increase in the CPI.
7. If a state is paying more than the 75th percentile, it cannot effect an increase until the 75th percentile (based on January 1, 1969 data) plus the increase in the CPI, exceeds the level of its payments on January 1, 1969.

With regard to the use of the CPI, the administration recognizes that there may be some problems in its application. Therefore, studies will be undertaken to develop a mechanism to allow Medicaid payments to keep up with the economy.

While Medicaid payments have received most of the headlines, the real key to economy under the program is utilization review.

Carriers, intermediaries, or single state agencies administering the program will be required to set up with local medical societies effective ways to review the necessity and quality of care furnished under the Medicaid program.

THE BREAKUP of a business partnership, the crack-up of a marriage, the shake-up of being fired or reduced to bankruptcy... after any significant loss or severe blow to self-esteem, *both* anxiety and depression almost always follow.

FOR MODERATE TO SEVERE ANXIETY WITH COEXISTING DEPRESSION

TRIAVIL®

TRANQUILIZER-ANTIDEPRESSANT

Containing perphenazine and amitriptyline HCl

For prescribing information, including indications, contraindications, warnings, precautions, and side effects, please see following page.

FOR MODERATE TO SEVERE ANXIETY WITH COEXISTING DEPRESSION

TRIAVIL®

TRANQUILIZER-ANTIDEPRESSANT

Containing perphenazine and amitriptyline HCl

TRIAVIL®2-25: Each tablet contains 2 mg. of perphenazine and 25 mg. of amitriptyline hydrochloride.

TRIAVIL®4-25: Each tablet contains 4 mg. of perphenazine and 25 mg. of amitriptyline hydrochloride.

TRIAVIL®2-10: Each tablet contains 2 mg. of perphenazine and 10 mg. of amitriptyline hydrochloride.

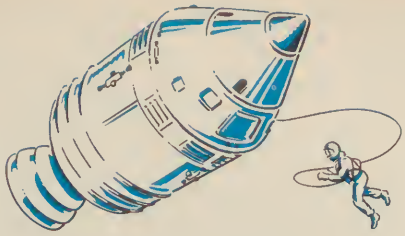
TRIAVIL®4-10: Each tablet contains 4 mg. of perphenazine and 10 mg. of amitriptyline hydrochloride.

INDICATIONS: Patients with moderate to severe anxiety and/or agitation and depressed mood; patients with depression in whom anxiety and/or agitation are severe; patients with depression and anxiety in association with chronic physical disease; schizophrenics with associated depressive symptoms.

CONTRAINDICATIONS: Central nervous system depression from drugs (barbiturates, alcohol, narcotics, analgesics, antihistamines); bone marrow depression; urinary retention; pregnancy; glaucoma. Do not give in combination with MAOI drugs because of possible potentiation that may even cause death. Allow at least 2 weeks between therapies. In such patients therapy with TRIAVIL should be initiated cautiously, with gradual increase in the dosage required to obtain a satisfactory response.

WARNINGS: Patients should be warned against driving a car or operating machinery or apparatus requiring alert attention, and that response to alcohol may be potentiated.

PRECAUTIONS: Suicide is always a possibility in mental depression and may remain until significant remission occurs. Supervise patients closely in case they may require hospitalization or concomitant electroshock therapy. Untoward reactions have been reported after the combined use of antidepressant agents having various modes of activity. Accordingly, consider possibility of potentiation in combined use of antidepressants. Not recommended for use in children. Mania or hypomania may be precipitated in manic-depressives (perphenazine in TRIAVIL seems to reduce likelihood of this effect). If hypotension develops, epinephrine should not be employed,as its action is blocked and partially reversed by perphenazine. Caution patients about errors of judgment due to change in mood.



SIDE EFFECTS: Similar to those reported with either constituent alone.

Perphenazine: Should not be used indiscriminately. Use caution in patients with history of convulsive disorders or severe reactions to other phenothiazines. Likelihood of untoward actions greater with high doses. Closely supervise with any dosage. Side effects may be any of those reported with phenothiazine drugs: blood dyscrasia (pancytopenia, thrombocytopenic purpura, leukopenia, agranulocytosis, eosinophilia); liver damage (jaundice, biliary stasis); extrapyramidal symptoms (opisthotonos, oculogyric crisis, hyperreflexia, dystonia, akathisia, dyskinesia, parkinsonism) usually controlled by the concomitant use of effective antiparkinsonian drugs and/or by reduction in dosage, but sometimes persist after discontinuation of the phenothiazine; severe acute hypotension (of particular concern in patients with mitral insufficiency or pheochromocytoma); skin disorders (photosensitivity, itching, erythema, urticaria, eczema, u to exfoliative dermatitis); other allergic reactions (asthma laryngeal edema, angioneurotic edema, anaphylactoid reactions); peripheral edema; reversed epinephrine effect; endocrine disturbances (lactation, galactorrhea, disturbances of menstrual cycle); grand mal convulsions cerebral edema; altered cerebrospinal fluid proteins; polyphagia; paradoxical excitement; photophobia; skin pigmentation; failure of ejaculation; EKG abnormalities (quinidine-like effect); reactivation of psychotic processes catatonic-like states; autonomic reactions such as drynes of the mouth, headache, nausea, vomiting, constipation, obstipation, urinary frequency, blurred vision, nasal congestion, and a change in the pulse rate; hypnotic effects; pigmentary retinopathy; corneal and lenticular pigmentation; occasional lassitude; muscle weakness; mild insomnia; significant unexplained rise in body temperature may suggest intolerance to perphenazine, in which case discontinue. Antiemetic effect may obscure signs of toxicity due to overdosage of other drugs or make diagnosis of other disorders such as brain tumors or intestinal obstruction difficult. May potentiate central nervous system depressants (opiates, analgesics, antihistamines, barbiturates, alcohol), atropine, heat, and phosphorous insecticides.

Amitriptyline: Careful observation of all patients recommended. Side effects include drowsiness (may occur within the first few days of therapy); dizziness; nausea; excitement; hypotension; fainting; fine tremor; jitteriness; weakness; headache; heartburn; anorexia; increased perspiration; incoordination; allergic-type reactions manifested by skin rash, swelling of face and tongue, itching; numbness and tingling of limbs, including peripheral neuropathy; activation of latent schizophrenia (however, the perphenazine content may prevent this reaction in some cases); epileptiform seizures in chronic schizophrenics; temporary confusion, disturbed concentration, or transient visual hallucinations on high doses; evidence of anticholinergic activity, such as tachycardia, dryness of mouth, blurring of vision, urinary retention, constipation, paralytic ileus; agranulocytosis; jaundice. The antidepressant activity may be evident within 3 or 4 days or may take as long as 30 days to develop adequately, and lack of response sometimes occurs. Response to medication will vary according to severity as well as type of depression present. Elderly patients and adolescents can often be managed on lower dosage levels.

For more detailed information consult your Merck Sharp and Dohme representative or see the package circular.

MSD | **MERCK SHARP & DOHME**
Division of Merck & Co., Inc., West Point, Pa. 19486
where today's theory is tomorrow's therapy

Man in space, now fait accompli, re-emphasizes the importance of Uro-Phosphate therapy. Research into the effect of space travel on the astronaut reveals that weightlessness causes loss of bone calcium. As the bones are required to bear less and less of the weight of the body they lose calcium, increasing the calcium content of the urine. When physical activity is reduced, the acidity of the urine should be adjusted to keep increased calcium in solution . . . . a prophylaxis to prevent kidney or bladder calculi.

Uro-Phosphate®

NOW A SUGAR-COATED TABLET

Each tablet contains: METHENAMINE, *300 mg.;* SODIUM ACID PHOSPHATE, *500 mg.*

Uro-Phosphate gives comfort and protection when inactivity causes discomfort in the urinary function. It keeps calcium in solution, preventing calculi; it maintains clear, acid, sterile urine; it encourages complete voiding and lessens frequency when residual urine is present.

Uro-Phosphate contains sodium acid phosphate, a natural urinary acidifier. This component is fortified with methenamine which is inert until it reaches the acid urinary bladder. In this environment it releases a mild antiseptic keeping the urine sterile.

Uro-Phosphate is safe for continuous use. There are no contra-indications other than acidosis. It can be given in sufficient amount to keep the urine clear, acid and sterile. A heavy sugar coating protects its potency.

Dosage:

For protection of the inactive patient 1 or 2 tablets every 4 to 6 hours is usually sufficient to keep the urine clear, acid and sterile.

2 tablets on retiring will keep residual urine acid and sterile, contributing to comfort and rest.

A clinical supply will be sent to physicians and hospitals on request.

WILLIAM P. POYTHRESS & COMPANY, INC., RICHMOND, VIRGINIA 23217

Manufacturers of Ethical Pharmaceuticals

Appearances may be deceiving

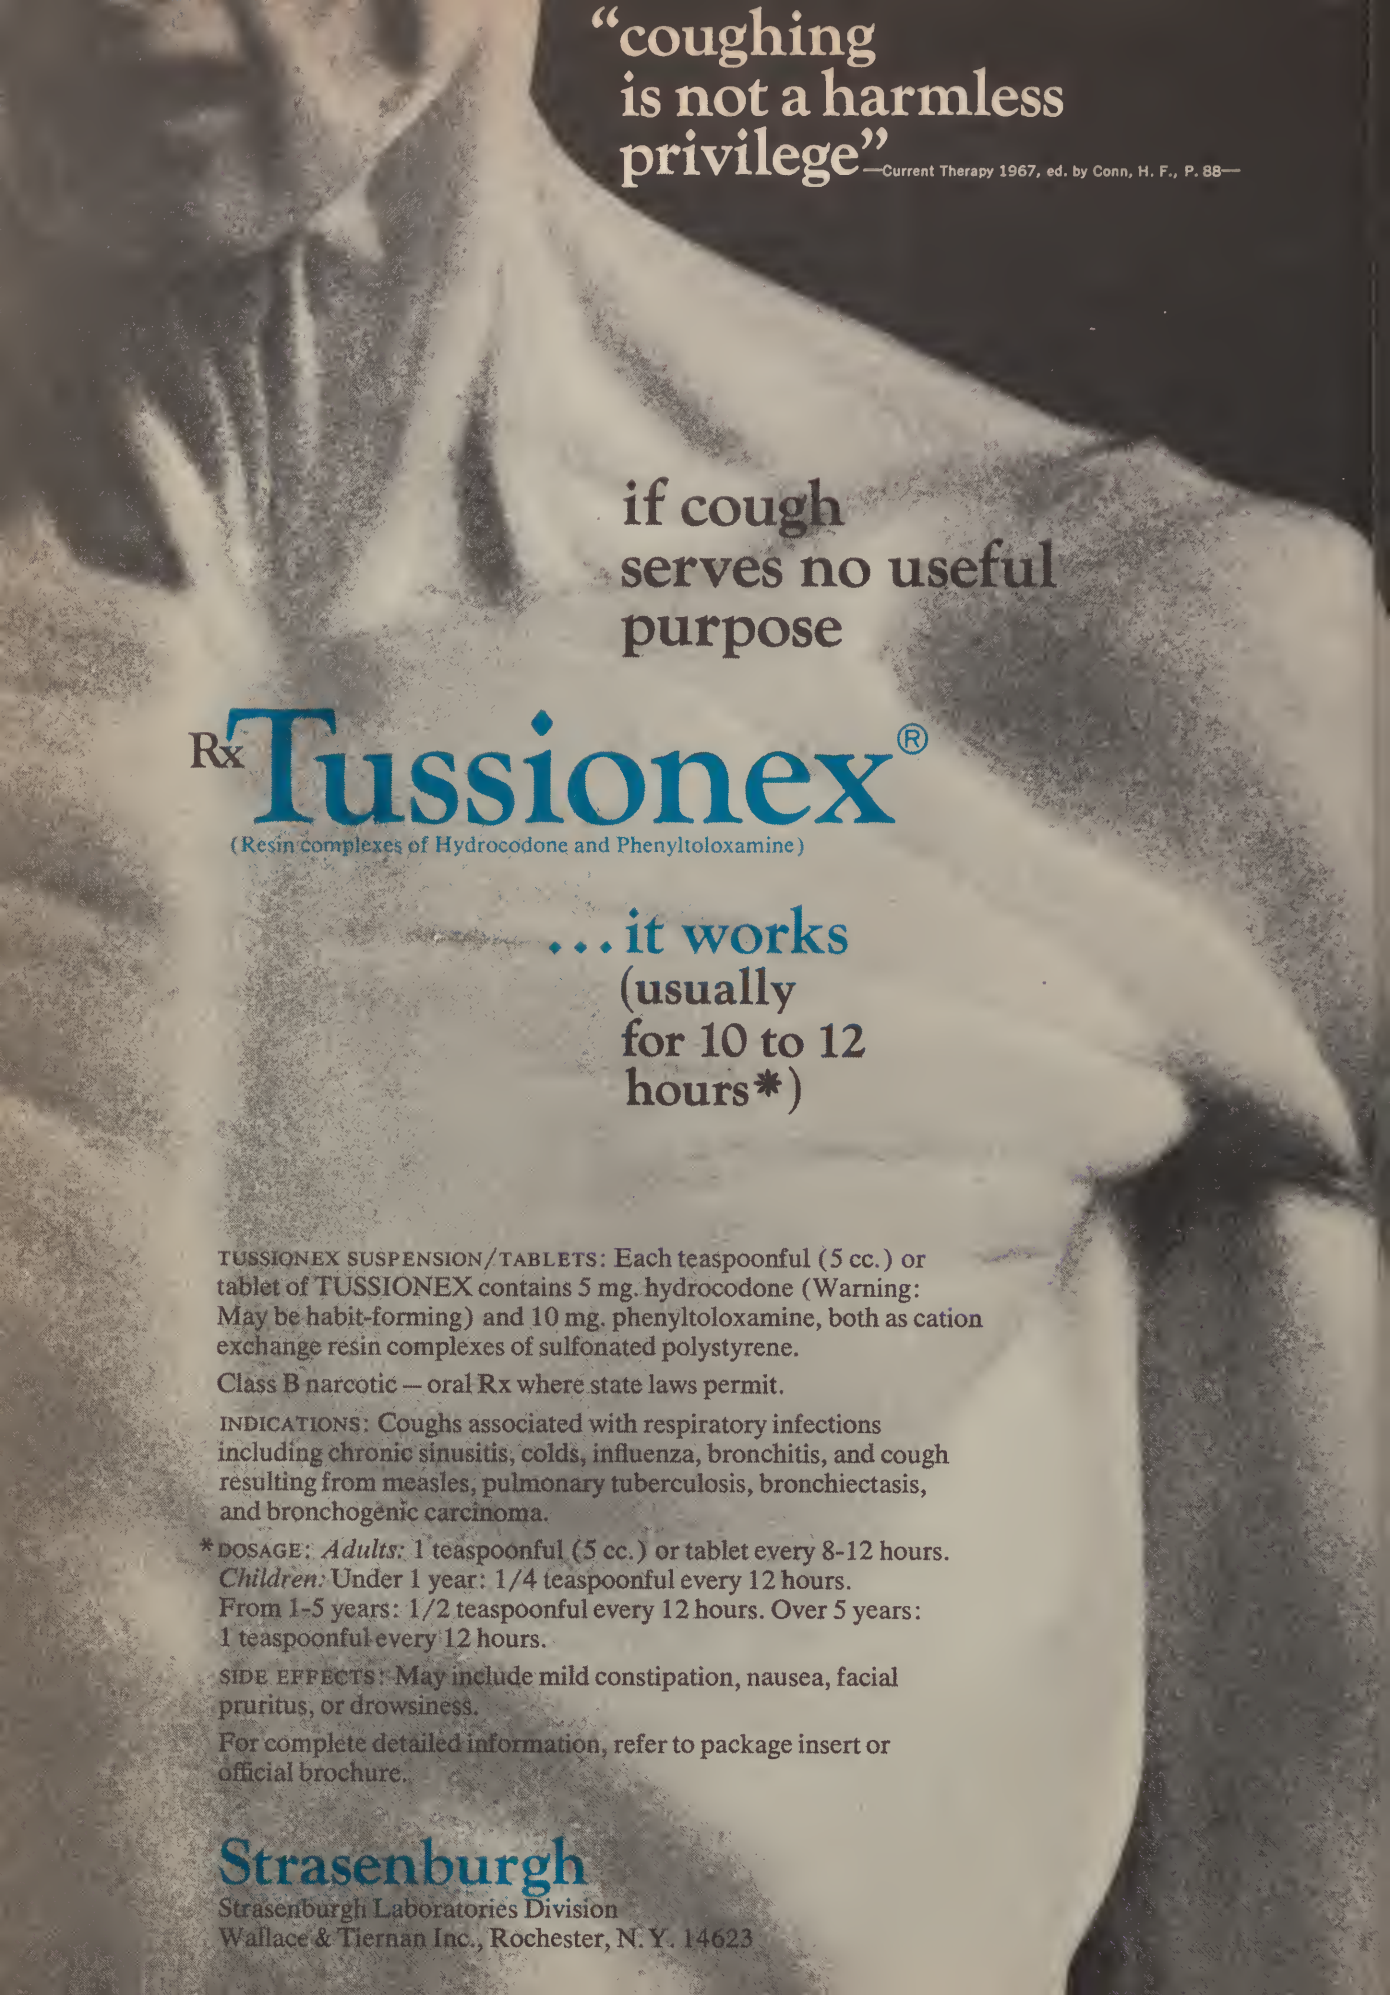
It may be tetracycline

but it's not ACHROMYCIN® V
Tetracycline HCl

unless it bears this signature.

250 mg. and 100 mg. capsules

Contraindications: Hypersensitivity to tetracyclines. *Warning:* In renal impairment, since liver toxicity is possible, lower doses are indicated; during prolonged therapy consider serum level determinations. Photodynamic reaction to sunlight may occur in hypersensitive persons. Photosensitive individuals should avoid exposure; discontinue treatment if skin discomfort occurs. *Precautions:* Nonsusceptible organisms may overgrow; treat superinfection appropriately. Tetracycline may form a stable calcium complex in bone-forming tissue and may cause dental staining during tooth development (last half of pregnancy, neonatal period, infancy, early childhood).



Side Effects: Gastrointestinal—anorexia, nausea, vomiting, diarrhea, stomatitis, glossitis, enterocolitis, pruritus ani. *Skin*—maculopapular and erythematous rashes; exfoliative dermatitis; photosensitivity; onycholysis, nail discoloration. *Kidney*—dose-related rise in BUN. *Hypersensitivity reactions*—urticaria, angioneurotic edema, anaphylaxis. *Intracranial*—bulging fontanels in young infants. *Teeth*—yellow-brown staining; enamel hypoplasia. *Blood*—anemia, thrombocytopenic purpura, neutropenia, eosinophilia. *Liver*—cholestasis at high dosage.

Upon adverse reaction, stop medication and treat appropriately.

Dulcolax®...so predictable you can almost set patients by it.

Dulcolax works so effectively that the time of bowel evacuation can often be predicted.

Dulcolax tablets taken at night will usually result in a convenient bowel movement the following morning. Dulcolax suppositories generally work within 15 minutes to an hour.

Dulcolax may be given to the aged, pregnant or nursing women, and children. It may be particularly helpful in conditions in which straining should be avoided. The drug, however, is contraindicated in the acute surgical abdomen.

Dulcolax® bisacodyl

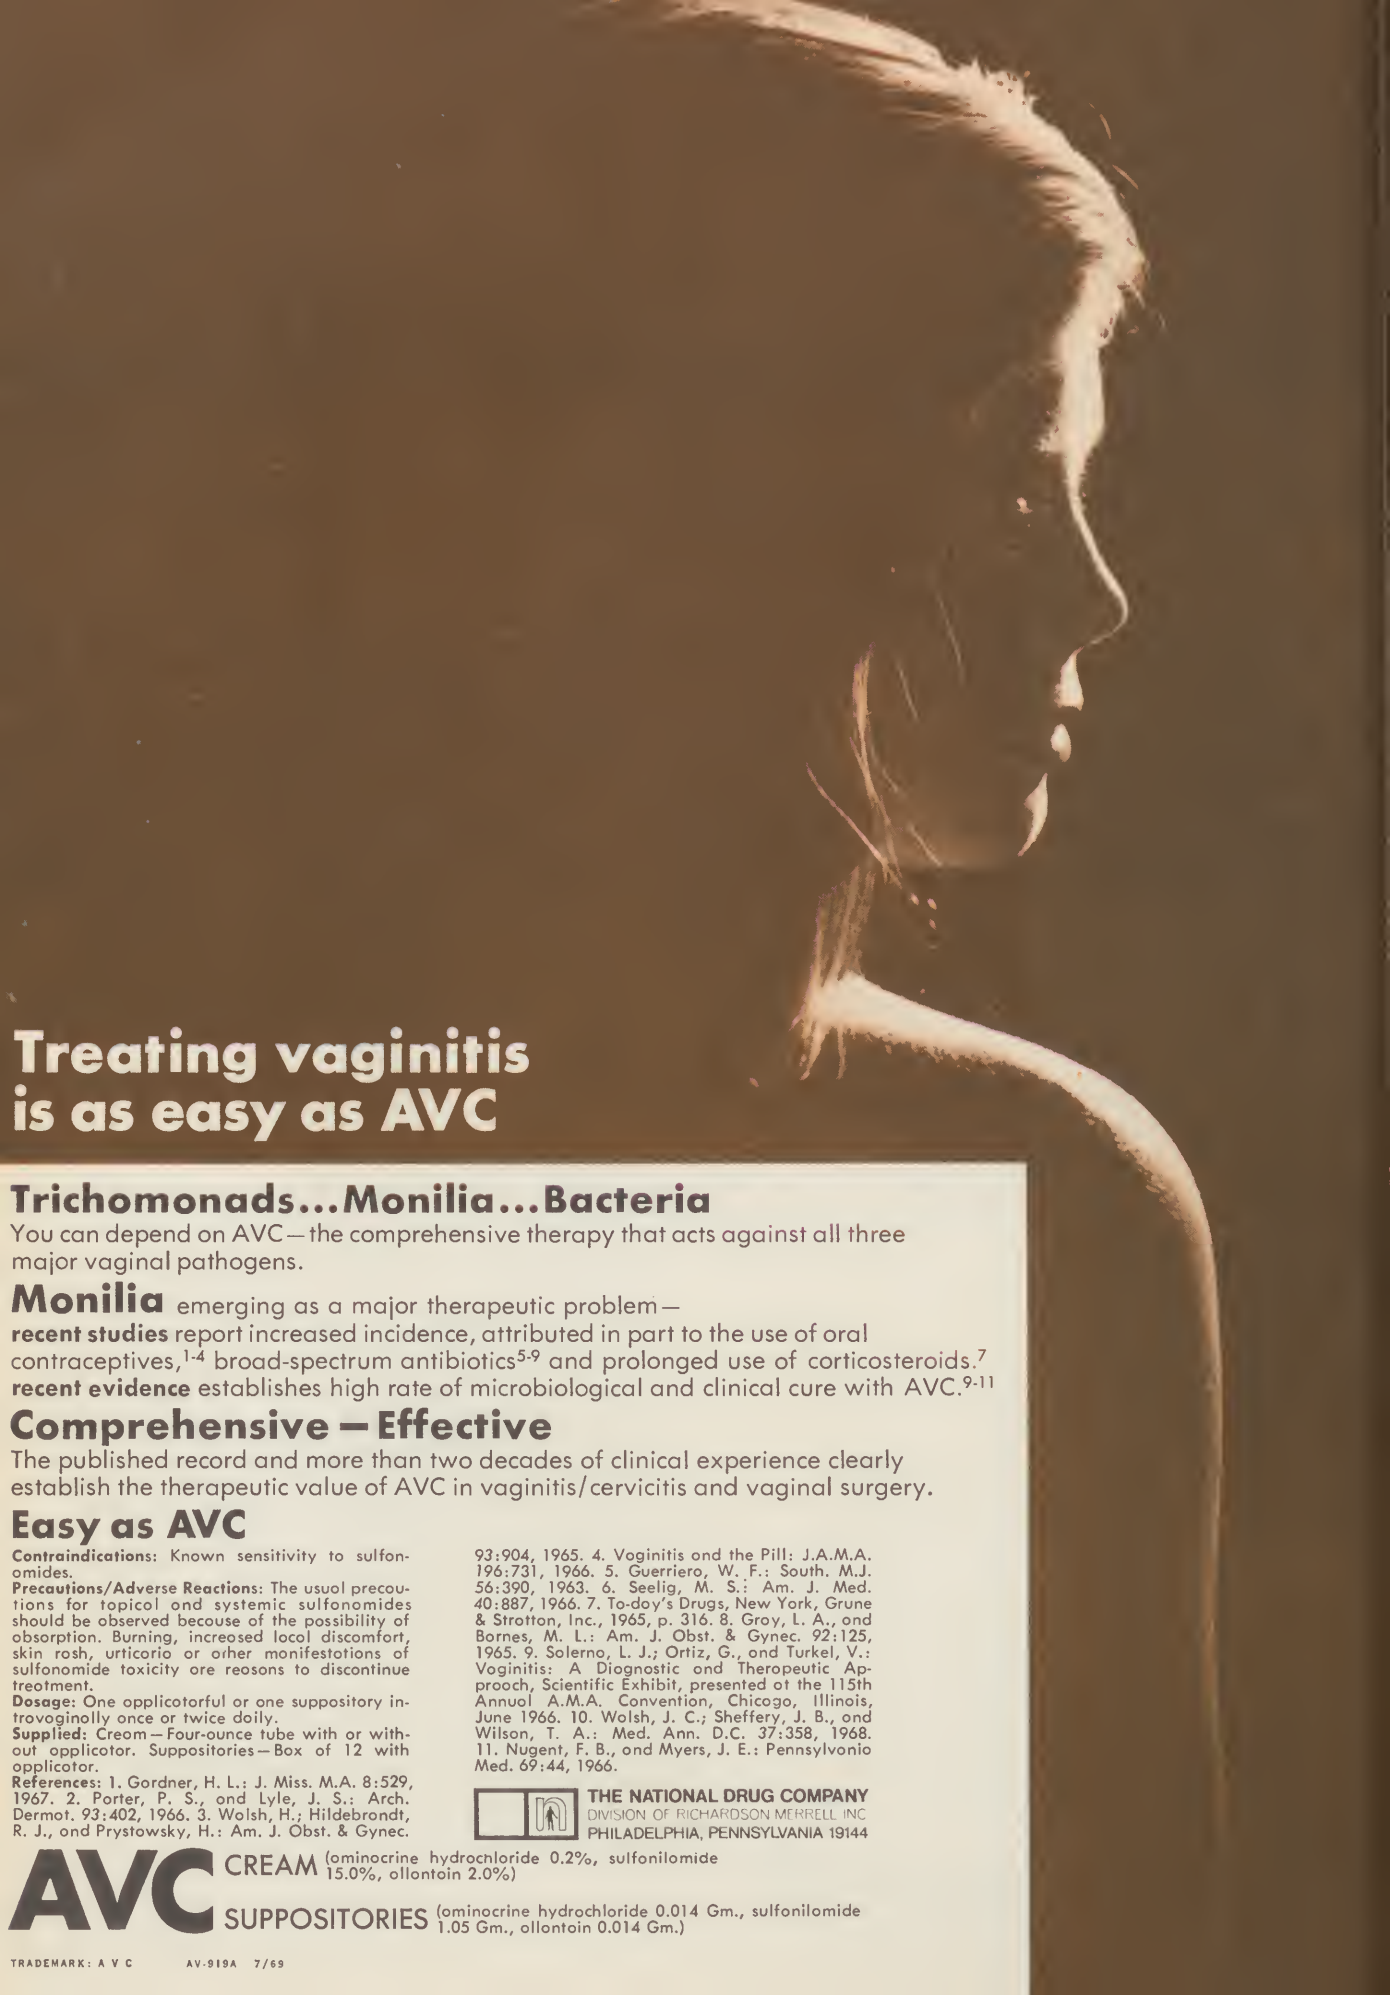
Painful night leg cramps...

unwelcome bedfellow for any patient– including those with arthritis, diabetes or PVD



One thing patients can sleep without, particularly patients with chronic disease conditions such as arthritis, diabetes or PVD, is painful night leg cramps. Although seldom the presenting complaint, night leg cramps can tie your patients up in painful knots. Now, just one tablet of QUINAMM at bedtime can usually bring an end to shattered sleep and needless suffering. Your patients will sleep restfully—gratefully—with QUINAMM, specific therapy to prevent painful night leg cramps.

Prescribing Information—Composition: Each white, beveled, compressed tablet contains: Quinine sulfate, 260 mg., Aminophylline, 195 mg. **Indications:** For the prevention and treatment of nocturnal and recumbency leg muscle cramps, including those associated with arthritis, diabetes, varicose veins, thrombophlebitis, arteriosclerosis and static foot deformities. **Contraindications:** QUINAMM is contraindicated in pregnancy because of its quinine content. **Precautions/Adverse Reactions:** Aminophylline may produce intestinal cramps in some instances, and quinine may produce symptoms of cinchonism, such as tinnitus, dizziness, and gastrointestinal disturbance. Discontinue use if ringing in the ears, deafness, skin rash, or visual disturbances occur. **Dosage:** One tablet upon retiring. Where necessary, dosage may be increased to one tablet following the evening meal and one tablet upon retiring. **Supplied:** Bottles of 100 and 500 tablets.

THE NATIONAL DRUG COMPANY
DIVISION OF RICHARDSON-MERRELL INC.
PHILADELPHIA, PENNSYLVANIA 19144

Quinamm™
(quinine sulfate 260 mg., aminophylline 195 mg.)

Specific therapy for night leg cramps

Treating vaginitis is as easy as AVC

Trichomonads...Monilia...Bacteria

You can depend on AVC—the comprehensive therapy that acts against all three major vaginal pathogens.

Monilia emerging as a major therapeutic problem—
recent studies report increased incidence, attributed in part to the use of oral contraceptives,[1-4] broad-spectrum antibiotics[5-9] and prolonged use of corticosteroids.[7]
recent evidence establishes high rate of microbiological and clinical cure with AVC.[9-11]

Comprehensive—Effective

The published record and more than two decades of clinical experience clearly establish the therapeutic value of AVC in vaginitis/cervicitis and vaginal surgery.

Easy as AVC

Contraindications: Known sensitivity to sulfonomides.
Precautions/Adverse Reactions: The usuol precoutions for topicol ond systemic sulfonomides should be observed becouse of the possibility of obsorption. Burning, increosed locol discomfort, skin rosh, urticorio or orher monifestotions of sulfonomide toxicity ore reosons to discontinue treotment.
Dosage: One opplicotorful or one suppository introvoginolly once or twice doily.
Supplied: Creom—Four-ounce tube with or without opplicotor. Suppositories—Box of 12 with opplicotor.

Comprehensive First-Aid Chart Offered

The American Academy of Pediatrics has released a newly-revised comprehensive first-aid chart which provides invaluable information on treatment of harmful injuries that most commonly occur among youngsters.

The chart has been prepared by the Academy's Committee on Accident Prevention and Subcommittee on Accidental Poisoning. It contains comprehensive information on first-aid treatment for convulsions, burns and scalds, puncture wounds, head injuries, choking and other injuries.

Measuring 11″ x 17″, the new chart is colorfully illustrated to accentuate the pertinent data presented. There is also a convenient place on the chart for the family physician's phone number.

Individual copies may be obtained for 20 cents a chart. The chart is also available at a 10% discount for quantities of 6 or more. Larger quantity prices are available upon request. Copies may be obtained by writing to: Publications, American Academy of Pediatrics, P.O. Box 1034, Evanston, Illinois 60204.

Library Exhibit on Cushing

Because 1969 is the 100th anniversary year of his birth, Dr. Harvey Cushing—the man most frequently cited as the father of neurosurgery—is being honored as the subject of an exhibit by the American College of Surgeons to be on display in the College Library through December.

Emphasizing Dr. Cushing's outstanding contributions to medicine in general, and to neurosurgery in particular, the exhibit will be comprised of books, photographs, notes, letters, and other memorabilia grouped into both panel and case displays.

Dr. Cushing's early life and family background will be recorded, together with significant documentation of his early surgical training with Dr. William S. Halsted, father of the residency system of training.

The exhibit will include drawings and sketches of surgical problems and therapy essayed by this outstanding surgeon. Also, it will emphasize his influence in later years on the Yale Historical Library.

The College's Library exhibits are open to the public as an educational service to the community and to visitors to the College.

BLUE SHIELD® provides more benefits per member dollar

Last year Maryland Blue Shield members got back 90¢ in medical care for every dollar paid in.

More than $20 million was paid out on behalf of over a million Marylanders. Blue Shield can pay more benefit dollars because nobody in the voluntary medical care prepayment field has lower operating expenses.

The remarkable benefits which Blue Shield can offer its members confirm the foresight of the doctors who originated this unique health care program. Through your continuing cooperation, Maryland Blue Shield remains the best basic value for your patients.

To find out how Blue Shield strengthens the doctor-patient relationship, use the convenient coupon.

CURRENT PRACTICE IN ORTHOPEDIC SURGERY, John P. Adams, MD; The C. V. Mosby Company, St. Louis, Mo. 1969.

This is the fourth volume in a series designed to update physicians, particularly orthopedists, in the current orthopedic practices and new developments since the last publication.

It consists of various papers presented by different authors, all experts in their particular area, all of which are contained in the last part of the book. The first portion, entitled Section 1, is devoted to a History of American Orthopedic Surgery and consists of papers dealing with Henry Gassett Davis, MD, 1807-1896; Lewis Albert Sayre, MD, 1820-1900; and DeForest Willard, MD, 1846-1910.

For these three sketches, alone, the book is well worth ordering.

A SYNOPSIS OF CONTEMPORARY PSYCHIATRY, 4th EDITION, George A. Ulett, MD, and D. Wells Goodrich, MD; The C.V. Mosby Company, St. Louis, Mo. 1969.

This handbook was written to fill the need for a brief, introductory text of psychiatry as a quick reference for psychiatric residents, medical and psychology interns, medical students, nurses and others whose work in the psychiatric clinic and hospital may be for a brief period of time.

With these people in mind, the handbook has been made small enough to fit in the side pocket of the clinic coat.

The material is organized into three general areas; (a) history taking and diagnostic procedures (b) clinical syndromes and (c) therapeutic measures. For a concise, purposeful text on psychiatry this certainly fills the bill and it is highly recommended both for its usefulness, as well as for its brevity and conciseness.

AS I SAW IT, Sylvan M. Shane; Lowry & Volz, Baltimore, Md. 1969.

AS I SAW IT *in The Soviet Union, in Israel, in Auschwitz, in Anesthesiology, in Dentistry, in Politics* is a kaleidoscope view of the highlights of Dr. Shane's life and times as they relate to his two specialties—anesthesiology and dentistry. Strongly autobiographical, the book sketches the author's career from "his struggle against poverty and his ardent effort to acquire a good education" to his invention of the *Breathaphone*, and the early days when anesthesiology was becoming a recognized medical specialty to Dr. Shane's political ventures—"I became a candidate for the U.S. Congress."

The forward, by Dr. John C. Krantz, Jr., professor emeritus of pharmacology, University of Maryland School of Medicine, is a detailed curriculum vitae of Dr. Shane.

The book is an entertaining and enlightening addition to any library and has been described as "a liberal education between two hard covers."

help her break an emerging habit pattern...

GYNOREST®
(DYDROGESTERONE)

helps break the emerging habit pattern of nonorganic primary dysmenorrhea.

Early relief of primary dysmenorrhea in the adolescent may lessen its tendency to become a habit pattern "which is very difficult to interrupt."* Dydrogesterone proves to be "...an extremely satisfactory drug...the most conservative type of progestational agent..."* for relief of severe and incapacitating dysmenorrhea in adolescents.

Gynorest provides these distinct advantages

normal cycles usually undisturbed... no inhibition of ovulation...occasional breakthrough bleeding can usually be controlled by dosage adjustment

mild, infrequent side effects... withdrawal is seldom required

freedom from estrogenic and androgenic effects... progestational in action

Mead Johnson
LABORATORIES

Contraindications No serious untoward reactions to Gynorest have been reported and there are no known contraindications to its use. There have been no adverse effects observed clinically on the hepatic, renal, or hemopoietic systems. **Precautions** Before hormonal treatment is considered in patients with excessive or abnormal uterine bleeding, the cause of such bleeding should be determined on an individual basis. Appropriate procedures should be used to determine whether an organic lesion or systemic disease is the cause of the bleeding. Although never reported for Gynorest, it should be borne in mind that other progestogens have been observed to cause fluid retention which on occasion may result in exacerbated attacks of epilepsy, migraine or asthma. **Adverse Reactions** Gynorest appears to be nontoxic. Mild gastrointestinal complaints such as nausea, diarrhea, or constipation have rarely been reported, but have not necessitated withdrawal of the drug. There have been no endocrinologic side effects such as masculinization of a female fetus, virilization of a female patient, or any corticosteroid activity reported from the use of Gynorest. Breakthrough bleeding can usually be controlled by increasing the dosage or by giving the drug in smaller doses at more frequent intervals to maintain a more constant blood level. **Dosage and Administration** Complete details are included in the package insert. Additional information may be obtained from Mead Johnson Laboratories. **Supplied** 10 mg. White Scored Tablets, bottles of 100, or 5 mg. White Scored Tablets, bottles of 50.

Third ACS TV Film Takes Up Subject of Teen-ager Sports Injuries

"To Win or to Play," the most recent public service film prepared by the American College of Surgeons for television showing, is the third in a series of four which the Board of Regents has authorized for production this year.

In sound and color, this one-minute film uses animated cartoons to stress the dangers of undue parental pressure and forced competitive spirit in sports activities involving the growing teen-ager. It takes its theme (and title) from an article on the subject, written by Nicholas J. Giannestras, Cincinnati, and printed originally in the July-August 1967 issue of the College BULLETIN.

Written by the College's communications staff, the film has been produced in the studios of Rick Reinert Productions, Cleveland. It will be released to some 200 television stations across the country.

Butisol SODIUM®
(SODIUM BUTABARBITAL)

the "daytime sedative" for everyday situational stress

When stress is situational—environmental pressure, worry over illness—the treatment often calls for an anxiety-allaying agent which has a prompt and predictable calming action and is remarkably well tolerated. BUTISOL SODIUM (sodium butabarbital) meets this therapeutic need.

After 30 years of clinical use . . . still a first choice among many physicians for dependability, safety and economy in mild to moderate anxiety.

Contraindications: Porphyria or sensitivity to barbiturates.

Precautions: Exercise caution in moderate to severe hepatic disease. Elderly or debilitated patients may react with marked excitement or depression.

Adverse Reactions: Drowsiness at daytime sedative dose levels, skin rashes, "hangover" and systemic disturbances are seldom seen.

Warning: May be habit forming.

Usual Adult Dosage: As a daytime sedative, 15 mg. (¼ gr.) to 30 mg. (½ gr.) t.i.d. or q.i.d.

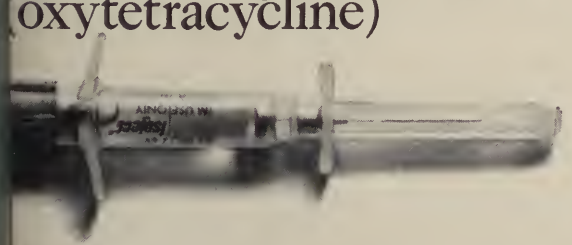
Available for daytime sedation: Tablets, 15 mg. (¼ gr.), 30 mg. (½ gr.); Elixir, 30 mg. per 5 cc. (alcohol 7%).

BUTICAPS® [Capsules BUTISOL SODIUM (sodium butabarbital)] 15 mg. (¼ gr.), 30 mg. (½ gr.).

McNEIL

McNeil Laboratories, Inc., Fort Washington, Pa.

No place for beginners



Terramycin®
(oxytetracycline)

Fire victim. Examination reveals second degree burn of lower leg. To combat shock, restore circulatory volume and replace protein loss, plasma is administered. Local pressure dressing applied. Limb elevated to limit the flow of lymph. About 36 hours after admission the patient develops an elevated temperature and complains of pain at the site of the lesion. Dressing removed. A suppurating slough area has developed over part of the burn. A swab specimen is taken for culture and the slough area is debrided. Antibacterial treatment is begun with Terramycin I.M. Days later, recovery is progressing, and the laboratory report shows a mixed infection with a predominance of susceptible coliform bacteria, confirming the therapeutic choice. Terramycin therapy is continued until all signs of infection disappear.

Experience has shown that Terramycin offers special advantages in treating bacterial infections complicating burns, when strains of causative organisms are susceptible. Broad-spectrum antibacterial coverage. Activity unaffected by penicillinase. Rapidly achieved therapeutic blood levels. Proven tissue toleration.

Terramycin I.M. is the only preconstituted broad-spectrum antibiotic designed specifically for intramuscular use. Requires no refrigeration. Remains stable for at least two years. Available for immediate use in Isoject,® a disposable injection unit. In difficult as well as routine cases, when tests reveal susceptible organisms, consider Terramycin. One of the world's most widely used broad-spectrums.

Terramycin® I.M.
(oxytetracycline)

Pfizer **LABORATORIES DIVISION**
New York, N.Y. 10017

Contraindicated: In individuals hypersensitive to any of the components of this drug.

Warnings: If renal impairment exists, even usual doses may lead to excessive systemic accumulation and possible liver toxicity. In such patients, lower than usual doses are indicated and for prolonged therapy oxytetracycline serum level determinations may be advisable.

Terramycin may form a stable calcium complex in any bone-forming tissue with no serious harmful effects reported thus far in humans.

Use of oxytetracycline during the last trimester of pregnancy, neonatal period and early childhood may cause discoloration of teeth. This effect occurs mostly during long-term use of the drug, but it has also been observed in usual short-treatment courses.

During treatment with tetracyclines, individuals susceptible to photodynamic reactions should avoid direct sunlight. Discontinue therapy at first evidence of skin discomfort.

Note: With oxytetracycline, phototoxicity is not believed to occur and photoallergy is very rare.

Precautions: Use of broad-spectrum antibiotics occasionally may result in overgrowth of nonsusceptible organisms. Where such infections occur, discontinue oxytetracycline and institute specific therapy.

As with all intramuscular preparations, Terramycin Intramuscular Solution should be injected well within the body of a relatively large muscle. *Adults:* The preferred sites are the upper outer quadrant of the buttock (i.e., gluteus maximus), or the mid-lateral thigh. *Children:* It is recommended that intramuscular injections be given preferably in the mid-lateral muscles of the thigh. In infants and small children the periphery of the upper outer quadrant of the gluteal region should be used only when necessary, such as in burn patients, in order to minimize the possibility of damage to the sciatic nerve.

The deltoid area should be used only if well developed such as in certain adults and older children, and then only with caution to avoid radial nerve injury. Intramuscular injections should not be made into the lower and mid-thirds of the upper arm. As with all intramuscular injections, aspiration is necessary to help avoid inadvertent injection into a blood vessel.

Increased intracranial pressure with bulging fontanelles has been observed occasionally in infants receiving therapeutic doses of the drug, but such signs and symptoms have disappeared rapidly on cessation of treatment with no sequelae.

Adverse Reactions: Subcutaneous and fat-layer injection may produce mild pain and induration which may be relieved by an ice pack. Very mild gastrointestinal disturbances, not requiring discontinuance of the drug, may occur occasionally. Allergic reactions, including anaphylaxis, rarely have been observed.

Dosage: *Adult:* The optimal dosage varies, depending on the type and severity of infection. Unless otherwise specified, a dose of 100 mg. every 8 to 12 hours, or a single daily dose of 250 mg. should be adequate for the treatment of most mild or moderately severe infections. In severe infections, 100 mg. every 6 to 8 hours, or 250 mg. every 12 hours may be necessary.

Serum levels obtained by the recommended dosages are comparable to those provided by the oral dosage of 1 to 2 Gm. daily in adults. Antibiotic therapy should be continued for at least 24 to 48 hours after all symptoms and fever have subsided.

In certain diseases specific courses of therapy may be recommended as a general guide. In primary and secondary syphilis for example, the daily administration of 2 Gm. oxytetracycline, orally, in divided doses for two weeks has given good results. In cases of gonococcal infection two intramuscular injections of 250 mg. each, or one intramuscular injection of 250 mg. combined with one gram given orally as a single dose, will usually suffice, but repetition of this therapy will be required in an occasional case.

In the treatment of hemolytic streptococcal infections, therapy should continue for at least 10 days to prevent development of rheumatic fever or glomerulonephritis.

In the treatment of staphylococcal infections indicated surgical procedures should be carried out in all cases.

Pediatric: A dosage of 3 mg./lb./day in two doses has been found satisfactory in the treatment of most mild to moderately severe infections. For more severe infections, higher dosages may be indicated and should be adjusted accordingly.

Terramycin Intramuscular Solution provides maximum absorption and patient toleration with minimal local irritation.

Supply: Terramycin (oxytetracycline) Intramuscular Solution: available in single dose, prescored glass ampules containing 100 or 250 mg. oxytetracycline/2 cc., Isoject® syringes containing 100 or 250 mg. oxytetracycline/2 cc. and 10 cc. multiple dose vials containing 50 mg. oxytetracycline/cc.

More detailed professional information available on request.

this ulcer did not heal...until its surface was cleared of dead tissue and debris

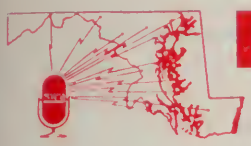
FIRST APPLICATION
ELASE Ointment is applied to a deep ulceration of a finger.

EIGHTEEN DAYS LATER
Healing has progressed rapidly without interruption or interference from any accumulated purulence or necrotic tissue. Greatly reduced size of lesion and minimal scar tissue indicate quality and vigor of healing which is almost complete.

to aid in debridement to facilitate healing in chronic cutaneous ulcers...

Elase® Ointment

(fibrinolysin and desoxyribonuclease, combined, [bovine] ointment)



PARKE-DAVIS

By helping to remove dead tissue and debris from the ulcer's surface, ELASE Ointment creates a better environment for the elimination of infection, for healthy granulation...*for healing.* Its lytic enzymes effectively break down DNA in dead leukocytes and other debris...the fibrin in blood clots, serum, and purulent exudates...and the denatured proteins in necrotic tissue. Protein elements of *living* tissue are relatively unaffected. ELASE Ointment is indicated in stasis ulcers and in other infected or inflamed ulcers caused by circulatory disturbances. In cases requiring skin grafting, it is used preoperatively for debridement. For ambulatory patients debridement with ELASE Ointment is a convenient therapy and a regimen likely to be followed. *Precautions:* Observe usual precautions against allergic reactions, particularly in persons with a history of sensitivity to materials of bovine origin or to mercury compounds. *Adverse Reactions:* Side effects attributable to the enzymes have not been a problem at the dose and for the indications recommended. *Discussion:* Successful use of enzymatic debridement depends on several factors: (1) dense, dry eschar, if present, should be removed surgically before enzymatic debridement is attempted; (2) the enzyme must be in constant contact with the substrate; (3) accumulated necrotic debris must be periodically removed; (4) the enzyme must be replenished at least once daily; and (5) secondary closure or skin grafting must be employed as soon as possible after optimal debridement has been attained. It is further essential that wound-dressing techniques be performed carefully under aseptic conditions and that appropriate systemically acting antibiotics be administered concomitantly if, in the opinion of the physician, they are indicated. *Available:* ELASE Ointment is supplied in 30-Gm. tubes containing 30 units (Loomis) of fibrinolysin and 20,000 units of desoxyribonuclease with 0.12 mg. thimerosal (mercury derivative); and in 10-Gm. tubes containing 10 units of fibrinolysin and 6,666 units of desoxyribonuclease with 0.04 mg. thimerosal. ELASE Ointment has a special base of liquid petrolatum and polyethylene; contains sodium chloride and sucrose used during manufacture; is stable at room temperature through the expiration date stated on the package.

MEDIC 1969–1970 SCHEDULE

OF POSTGRADUATE PROGRAMS

presented through

Medical Education's Dedicated Instructional Channel

Supported in part by a grant from Merck Sharp and Dohme

NOVEMBER 21, 1969 — 12:30 PM

PRE-ECLAMPSIA AND ECLAMPSIA

Frank Kaltreider, MD
Chief, Department of Obstetrics and Gynecology
Baltimore City Hospitals

Rafael Garcia, MD
Assistant Chief of Pathology
Baltimore City Hospitals

Pre-eclampsia is a preventable disease. Pre-eclampsia is commonly associated with varied complications. For these reasons warning signs, apparently innocent, cannot be ignored.

Sponsor: BALTIMORE CITY HOSPITALS

Replays:	Monday, November 24, 1969	12:30 PM
	Wednesday, November 26, 1969	9:00 AM

NOVEMBER 28, 1969 — 12:30 PM

CURRENT IMMUNIZATION PRACTICES

David H. Carver, MD
Associate Professor of Pediatrics
Associate Professor of Microbiology
The Johns Hopkins University School of Medicine

This discussion will deal with a suggested schedule of immunization of children and will emphasize particularly the new vaccines, mainly measles, mumps, and rubella.

DECEMBER 5, 1969 — 12:30 PM

OBESITY

Simeon Margolis, MD
Assistant Professor of Medicine
The Johns Hopkins University School of Medicine
University of Maryland School of Medicine

An increasing number of patients are turning to physicians for assistance in weight reduction and for treatment of the complications of obesity. Management of the obese patient is an extremely frustrating medical problem, but may involve dietary, drug, and psychiatric measures. This talk will cover the pathogenesis, complications, and management of obesity.

DECEMBER 12, 1969 — 12:30 PM

INTERPRETATION OF BRAIN SCANS

Frank H. DeLand, MD
Assistant Professor of Radiology
The Johns Hopkins University School of Medicine

The accumulation of experience over the past decade has enabled us to characterize abnormal accumulations of radioactivity. Histologic diagnosis cannot be made from the brain scans when an abnormal accumulation, as seen in a scan, is nonspecific. However, the nature of the lesion can be inferred, based on its scan characteristics of size, shape, concentration of activity and location.

MEDICAL NEWS

The American Board of Family Practice has announced that it will give its first examination for certification in various centers throughout the United States. The examination will be given over a two-day period, February 28–March 1, 1970.

Information concerning eligibility for the examination may be obtained by writing to: Nicholas J. Pisacano, MD, Secretary, American Board of Family Practice, Inc., University of Kentucky Medical Center, Annex #2, Room 229, Lexington, Kentucky 40506.

* * *

Dr. Bordley

John E. Bordley, MD, of Baltimore, is executive director and vice-chairman of **The American Council of Otolaryngology,** which recently opened its national headquarters at 1100 17th St. N.W., in Washington, D.C. Wesley H. Bradley, MD, of Syracuse, N.Y., is consultant and assistant to Dr. Bordley.

Dr. Bordley is Andelot Professor Emeritus of Larvngology and Otology, The Johns Hopkins University School of Medicine. He is also Professor of Environmental Medicine, Division of Audiology and Speech, The Johns Hopkins University School of Hygiene and Public Health; and is National Consultant in Otolaryngology to the Surgeon General, U.S. Air Force.

The American Council, founded in September 1968, is the first national body designed specifically to represent otolaryngology through the development of national programs for improved patient care, greater educational opportunities, and to further research.

* * *

On September 25, 1969, a surprise testimonial dinner was given to honor **Mary K. L. Sartwell, MD,** in Bethesda, Maryland. The dinner was organized by the parents of Dr. Sartwell's pediatric patients and by her staff, and was attended by approximately 250 guests. Dr. Sartwell was presented with a plaque commemorating her 25 years as a physician and in appreciation of her services to the community.

* * *

John W. Ferree, MD, MPH, retired September 1st after serving ten years as executive director of the National Society for the Prevention of Blindness. His successor is Wilfred D. David, MD, MPH. Dr. Ferree will continue as a member of the National Eye Institute's Advisory Council, the National Accreditation Council for Agencies Serving the Blind and Visually Handicapped, Illumination Engineering Research Institute, and American Foundation for Overseas Blind.

A graduate of the University of Pennsylvania, Dr. Ferree received his MD degree from the Indiana University School of Medicine and his master's degree in public health from The Johns Hopkins School of Hygiene and Public Health.

* * *

At a meeting of the Baltimore County Dental Society, on September 23, 1969, **Arlie R. Mansberger, Jr., MD,** Professor of Surgery at the University of Maryland Medical School, spoke on the topic "Shock."

Dr. Mansberger received his degree from Western Maryland College in 1943, and earned his MD degree from the University of Maryland School of Medicine in 1947. Author of 73 publications, Dr. Mansberger was Director of Clinical Research (Shock Trauma Unit) at the University of Maryland Hospital from 1962 to 1963.

* * *

George Melville Williams, MD, a specialist in the field of organ transplantation, has been named Chief of Surgery at Good Samaritan Hospital in Baltimore. Dr. Williams was also appointed professor of surgery at The Johns Hopkins University Medical School in July 1969. A graduate of Oberlin College, he received his MD degree from Harvard University in 1957.

Dr. Williams' research interests are immunology and transplantation, and his studies concern tissue immunity and the rejection phenomenon of transplanted organs.

* * *

Harvey Webb, Jr., MD, a specialist in public health dentistry, has been named associate director of the outpatient department of The Johns Hopkins Hospital, and coordinator of outpatient services for the Office of Health Care Programs, a unit of the hospital and The Johns Hopkins University. In this capacity, he will be responsible for coordinating services between the outpatient department of the hospital and health care programs established in the community.

Until his appointment at Johns Hopkins on September 1st, Dr. Webb was assistant professor in the departments of community dentistry at both the University of Maryland and Howard University. Since 1968, he has served as dental coordinator of the Provident Hospital Comprehensive Neighborhood Health Center, and was a member of the dental department staff at Provident.

Dr. Webb received three degrees from Howard University: the BS degree in 1956, DDS degree in 1960, and MS degree in 1962. He was awarded a masters degree in public health in 1967 by The Johns Hopkins University School of Hygiene and Public Health.

* * *

On September 30, 1969, **Maxwell M. Wintrobe, MD,** delivered the 12th annual Tinsley R. Harrison Lecture at the University of Alabama, on the subject "Refractory Anemia 1969." Dr. Wintrobe, Distinguished Research Professor of Internal Medicine at the University of Utah, has served as visiting professor in more than 20 American and foreign institutions and has held memberships in more than 30 health science organizations in addition to 50 national and international scientific committees. He has edited several professional publications, authored over 300 journal articles, and is perhaps best known as the author of *Clinical Hematology,* a widely used medical textbook.

Dr. Wintrobe received his BA, BS, and MD degrees from the University of Manitoba, Canada. He was awarded a PhD degree from Tulane University in New Orleans in 1929. Dr. Wintrobe has served on the faculty of The Johns Hopkins University Medical School as instructor, and later, as associate in medicine. He was also assistant physician, associate physician, and physician-in-charge of the Clinic for Nutritional, Gastro-intestinal and Hemopoietic Disorders at Johns Hopkins.

* * *

Stuart C. Levine, MD, radiologist, has moved his office to: 507 Latrobe Building, 2 East Read Street, Baltimore, Maryland 21202.

* * *

Louis J. Kolodner, MD, has announced the removal of his office for the practice of general surgery to: 6609 Park Heights Avenue, Garden View Apartments, Baltimore, Maryland 21215.

* * *

A **Secretary's Committee on Mental Retardation** has been appointed by the Secretary of Health and Mental Hygiene, **Neil Solomon, MD, PhD.** Harry Shriver, immediate past president of the Baltimore Association for Retarded Children, has been named committee chairman; Lambros D. Callimahos, of New Carrollton, president of the Maryland Association for Retarded Children, has been designated vice-chairman.

The committee will seek to develop a program that will include the initiation or extension of day care services, sheltered workshops, vocational rehabilitation units, halfway houses, residential facilities, training and activity centers, group homes, foster care homes and nursing home care, with emphasis on non-residential facilities. After the plan has been approved, the committee is being asked to design a program to inform the public of the need for increased emphasis on mental retardation activities in the state.

Dr. Solomon

* * *

Theodore H. Kaiser, MD, has opened his office for the practice of child and adolescent psychiatry at: 550 North Broadway, Baltimore, Maryland 21205.

* * *

The United States Pharmacopeial Convention has invited full-time graduate and undergraduate students of accredited pharmacy and medical schools throughout the country to prepare papers on the topic "The USP Role in Improving Drug Therapy." Two awards will be presented: one for the best paper submitted by a pharmacy student, and one for the best paper submitted by a medical student. The winners will each receive an award of $250 and an expense-paid trip to the USPC Sesquicentennial Meet-

ing in Washington, D.C., in April 1970.

For information, write: United States Pharmacopeia, 4630 Montgomery Avenue, Bethesda, Maryland 20014.

* * *

Robert W. Gibson, MD, Medical Director of the Sheppard and Enoch Pratt Hospital, Towson, Maryland, has been appointed to the Commission on the Delivery of Mental Health Services, a division of the American Psychiatric Association. Making the appointment was **Raymond Waggoner, MD,** President of the American Psychiatric Association.

* * *

Senator Gaylord Nelson (D. Wisc.) has introduced a bill that would authorize the Secretary of Health, Education and Welfare to perform tests on all new drugs that are submitted to him. A National Drug Testing and Evaluation Center would be established for this purpose. The Secretary could also contract out drug testing to qualified individuals or institutions. The sponsor of the drug, who would pay for the testing, could request a program report every 60 days. The Nelson bill is now before the Senate Labor and Public Welfare Committee.

* * *

Recently appointed as a Kennedy Scholar, working in the Joseph P. Kennedy Jr. Laboratory for Studies in Mental Retardation at the Johns Hopkins Children's Medical and Surgical Center, is **Guy M. McKhann, MD,** who joined the Johns Hopkins faculty January 1, 1969, as Kennedy Professor and director of the new department of neurology. The Kennedy Foundation will provide $25,000 a year for ten years for Dr. McKhann's work, who will orient his department to investigations of the development of the nervous system and of its normal and degenerative processes.

Dr. McKhann will work with the three other Kennedy Scholars: **David Carter, MD,** associate professor of pediatrics and microbiology; **R. Rodney Howell, MD,** associate professor of pediatrics, and **Hendrik Van der Loos, MD,** associate professor of anatomy.

Robert E. Cooke, MD, director of the department of pediatrics, in which the Kennedy Laboratory is located, said this program at Johns Hopkins has become the major service laboratory resource for the area in researching genetic causes of mental retardation, and is the basis for the new prenatal birth defects detection program now underway and supported by the National Foundation.

* * *

On October 9, 1969, approximately 1,523 surgeons were inducted as new Fellows (members) of the **American College of Surgeons,** in ceremonies held during their annual five-day Clinical Congress in San Francisco.

Among the new Fellows from Maryland are: **Paul Bormel, MD, William H. M. Finney, MD, Roelman W. Immink, MD, Robert H. Johnson, Jr., MD, and Manuel Sanchez, MD, of Baltimore; Bahram Erfan, MD, of Cheverly; Frederick W. Miltenberger, MD, of Cumberland; Ernesto A. Tolentino, MD, of Glen Burnie; Maher W. Ishak, MD, and Henry H. Kwak, MD, of Havre de Grace; Frederick Y. Donn, MD, of Kensington; Nasser Rezai, MD, of Laurel; Walter D. DeVault, Jr., MD, and Nevins W. Todd, Jr., MD, of Salisbury; Martin H. Eichler, MD, Jerry S. Farber, MD, and Leonard L. Kogan, MD, of Silver Spring; and Patrick C. Phelan, Jr., MD, of Towson.**

* * *

Peter Tsairis, MD, who has been a resident in neurology, and **A. M. Karas, MD,** who has been a resident in surgery, both at the Mayo Graduate School of Medicine, University of Minnesota at Rochester, have left that city to reside in Maryland. Dr. Karas will be located in Baltimore, and Dr. Tsairis will be located in Bethesda.

* * *

F. J. Ramsay, MD, has been named Director of the newly-created Office of Research in Medical Education at the University of Maryland School of Medicine. Under his direction, the Office will study the school's present curriculum and plan changes in accordance with the needs of changing medical practice and the demands of a changing society.

In addition to his new post, Dr. Ramsay will continue to teach embryology at the University of Maryland School of Medicine. Dr. Ramsay received his bachelor's degree in biology at Washington and Lee University in Lexington, Va., and his MS and PhD in anatomy at the University of Illinois School of Medicine.

It's not too soon to make reservations for

Med-Chi's Annual Meeting

April 1, 2, 3, 1970

Call or write the Faculty office for information

plan to attend the 23rd ama clinical convention denver, colorado-november 30-december 3, 1969

A bustling skyscraper-studded cosmopolitan city, Denver, Colorado is western in character and dotted with sophisticated shops, superb restaurants, and theaters. And, just minutes away, the great Colorado Rockies — with forests, lakes and tumbling streams, internationally known ski areas, ghost towns, hunting and fishing.

As a general practitioner or specialist, you will find the Denver winter medical meeting a highly rewarding experience. Scientific Program Sessions, Breakfast Roundtable Conferences, Clinical Workshops, Panel Discussions, Television, Medical Motion Pictures, and hundreds of Scientific and Industrial Exhibits to show you the latest in equipment, services, and drugs are some of the means of keeping up-to-date in medicine.

Be sure to look for the complete scientific program, plus forms for advance registration and hotel accommodations in the October 20th issue of JAMA.

THIRD ANNUAL SEMINAR

ON THE MEDICAL ASPECTS OF SPORTS

Saturday, December 6, 1969 — 9:00 AM to 4:30 PM

Catonsville Community College,
800 South Rolling Road, Catonsville

Chairman of Arrangements
G. Overton Himmelwright, MD, FRCSM

9:00 AM Registration—Classroom Building

10:00 AM Opening Remarks
B. A. Barringer, EdD
President
Catonsville Community College
John F. Schaefer, MD
Chairman, Executive Committee
Medical and Chirurgical Faculty

10:15 AM Room A—**Reflection on the 1968 Olympics Conducted at High Altitude**
Thomas F. Waddell, MD
Georgetown University Hospital
Washington, D.C.

Room B—**Physical Medicine in Athletic Rehabilitation**
Alvin M. Brown, MD
Medical Director
Atlanta Southside Comprehensive Health Center
Atlanta, Georgia

11:30 AM Room A—**Conditioning of the Athlete**
Mr. James Kehoe
Director of Athletics
University of Maryland
College Park, Maryland

Room B—**Neurological Injuries—Field Diagnosis, and Transportation**
Charles W. Henderson, MD
St. Agnes Medical Center
Baltimore, Maryland

12:15 PM Lunch—May be purchased on the campus

1:30 PM. Room A—**Athletic Competition for Women and Teen-Age Girls**
Tenley Albright, MD
Boston, Massachusetts
World and Olympic Figure Skating Champion

Room B—**The Role of "Drugs" in Athletics**
William J. Kinnard, Jr., PhD
Dean, University of Maryland
School of Pharmacy
Baltimore, Maryland

Gary L. Buterbaugh, PhD
Assistant Professor of Pharmacology
University of Maryland School of Pharmacy

2:45 PM Room A—**Psychological and Psychosomatic Problems in the Athlete**
Burris Husman, EdD
Professor of Physical Education
University of Maryland
College Park, Maryland

Room B—**Medicolegal Responsibility for the Athlete by School Administrator, Team Physician, and Coach**
Betty VanderSmissen, ReD, JD
Professor of Recreation
Penn State University
State College, Pennsylvania

3:30 PM Taping Clinics—Conducted on an informal basis so instruction can be more individualized

4:30 PM Adjournment

Program is sponsored by the Medical and Chirurgical Faculty of the State of Maryland and the Division of Health, Physical Education, and Recreation of Catonsville Community College.

3rd Annual Seminar on the Medical Aspects of Sports, December 6, 1969

MED-CHI TOUR

The Medical and Chirurgical Faculty is sponsoring another exciting tour in the near future:

ORIENTAL CARNIVAL—May 1 to May 17, 1970

A fabulous deluxe tour leaving from Friendship Airport. This is an all-inclusive with six fun-filled days and nights in Tokyo, seven glorious days and nights in Hong Kong, three enchanting days in Honolulu. An opportunity is provided to visit the fabulous 1970 Japan World Exposition in Osaka via the famous "Bullet" train (140 m.p.h.). Included are sightseeing tours, a get-together cocktail party, dinners in restaurants of your choice, breakfasts, and many other attractions.

Make your reservations NOW: For information and reservations contact Mrs. Beverly Wolins, Travel Guide Agency, 416 North Charles Street, Baltimore 21201 (301-727-0680) or Mrs. Genevieve Ritchie, the Faculty office, 1211 Cathedral Street, Baltimore 21201 (301-539-0872).

Let's be specific about Campbell's Soups... and *reducing diets*

There are more than 30 million people in America who are overweight. During the next year, you probably will see more than 1,000 of them in your own practice.

One good way to help these patients is to give them a reducing diet based on ordinary eating patterns.

Campbell has prepared a sensible plan for weight control based on ordinary eating patterns. The plan consists of a patient instruction booklet and a set of menus which provide approximately 1,400 calories daily. The menus are balanced to provide the minimum daily requirements of nutrients.

To obtain a supply for your office write to:
Campbell Soup Company, Box 265, Camden, N. J. 08101

NOW IS THE TIME... TO GIVE HER TIME WITH OVULEN-21®

Each tablet contains ethynodiol diacetate 1 mg., mestranol 0.1 mg.

The new mother needs time . . .
to adjust to motherhood,
to give her new baby all the love
and attention he requires.
She needs time for her husband . . .
and for herself as well . . .
so that she can come to terms
with the increased cares
and responsibilities now facing her.
She needs time to decide
when she will have additional children
and how many she will have.

OVULEN-21®

Each tablet contains ethynodiol diacetate 1 mg., mestranol 0.1 mg.

GIVES HER TIME

Your prescription for Ovulen-21 gives the new mother time to meet her family's present needs...to plan for her family's future.

She can take Ovulen-21 confidently and comfortably month after month. Its dependability is enhanced by its simplicity of use. A woman needs little or no time to learn the simple Ovulen-21 regimen: three weeks on—one week off. And the automatic record-keeping of the petite, virtually "patient-proof" Ovulen-21 Compack® helps to maintain her schedule...helps put time on her side.

Immediately post partum is the time

It is the time when motivation is highest—when a new mother needs expert advice for the future, so she can space her children and limit her family.

It is also the most opportune time, since she is conveniently present in the hospital, for her to be given both instructions and a prescription.

Non-nursing mothers may begin Ovulen-21 immediately after delivery, on the day of departure from the hospital or at the first postpartum visit, as desired. It is recommended that nursing mothers begin Ovulen-21 four weeks after delivery.

A small fraction of the hormonal agents in oral contraceptive pills has been identified in the milk of mothers receiving these drugs. The long-range effect on the nursing infant cannot be determined at this time.

Indication—Oral contraception.

Contraindications—Thrombophlebitis, thromboembolic disorders, cerebral apoplexy or a past history of these conditions, markedly impaired liver function, known or suspected carcinoma of the breast, known or suspected estrogen-dependent neoplasia, undiagnosed abnormal genital bleeding.

Warnings—Watch for the earliest manifestations of thrombotic disorders (thrombophlebitis, cerebrovascular disorders, pulmonary embolism, retinal thrombosis); if present or suspected discontinue the drug immediately.

British studies reported in April 1968[1,2] estimate there is a seven- to tenfold increase in mortality and morbidity due to thromboembolic diseases in women taking oral contraceptives. In these controlled retrospective studies, involving 36 reported deaths and 58 hospitalizations due to "idiopathic" thromboembolism, statistical evaluation indicated that the differences observed between users and non-users were highly significant. The conclusions reached in the studies are summarized in the table below:

Comparison of Mortality and Hospitalization Rates Due to Thromboembolic Disease in Users and Non-Users of Oral Contraceptives in Britain.

Category	*Mortality Rates*		*Hospitalization Rates (Morbidity)*
	Age 20-34	*Age 35-44*	*Age 20-44*
Users of Oral Contraceptives	1.5/100,000	3.9/100,000	47/100,000
Non-Users	0.2/100,000	0.5/100,000	5/100,000

No comparable studies are yet available in the United States. The British data, especially as they indicate the magnitude of the increased risk to the individual patient, cannot be applied directly to women in other countries in which the incidences of spontaneously occurring thromboembolic disease may differ.

Discontinue medication pending examination if there is sudden partial or complete loss of vision, or sudden onset of proptosis, diplopia or migraine. Withdraw medication if papilledema or retinal vascular lesions are found.

Since the safety of Ovulen in pregnancy has not been demonstrated, it is recommended that pregnancy be ruled out for any patient who has missed two consecutive periods before continuing the contraceptive regimen. If the patient has not adhered to the prescribed schedule the possibility of pregnancy should be considered at the first missed period.

A small fraction of the hormone agents in oral contraceptives has been identified in the milk of mothers receiving these drugs. The long-range effect on the nursing infant cannot be determined at this time.

Precautions—Pretreatment physical examination should include special reference to the breasts and pelvic organs, and a Papanicolaou smear.

Endocrine and possibly liver function tests may be affected by Ovulen. Therefore, it is recommended that such tests if abnormal be repeated after the drug has been withdrawn for two months.

Pre-existing uterine fibromyomas may increase in size under the influence of progestogen-estrogen preparations.

Because these agents may cause some degree of fluid retention, conditions which might be influenced by this factor, such as epilepsy, migraine, asthma, cardiac or renal dysfunction, require careful observation.

In breakthrough bleeding, and all irregular vaginal bleeding, consider nonfunctional causes. Adequate diagnostic measures are indicated in undiagnosed vaginal bleeding.

Carefully observe patients with a history of psychic depression and discontinue the drug if severe depression recurs.

Any possible influence of prolonged Ovulen therapy on pituitary, ovarian, adrenal, hepatic or uterine function awaits further study.

A decrease in glucose tolerance has occurred in a significant percentage of patients on oral contraceptives. The mechanism of this decrease is obscure. For this reason, diabetic patients should be observed carefully while receiving Ovulen.

Because of the effects of estrogens on epiphyseal closure Ovulen should be used judiciously in young patients in whom bone growth is not complete.

The age of the patient constitutes no absolute limiting factor, although Ovulen therapy may mask the onset of the climacteric.

The pathologist should be informed of Ovulen therapy when relevant specimens are submitted.

Adverse Reactions—A statistically significant association has been shown between use of oral contraceptives and the following serious adverse reactions: thrombophlebitis, pulmonary embolism.

Although available evidence is suggestive of an association, such a relationship has been neither confirmed nor refuted for the following serious adverse reactions: cerebrovascular accidents, neuro-ocular lesions, e.g., retinal thrombosis and optic neuritis.

The following adverse reactions are known to occur in patients receiving oral contraceptives: nausea, vomiting, gastrointestinal symptoms (such as abdominal cramps and bloating), breakthrough bleeding, spotting, change in menstrual flow, amenorrhea during and after treatment, edema, chloasma or melasma, breast changes (tenderness, enlargement, secretion), change in weight, changes in cervical erosion and cervical secretions, suppression of lactation when given immediately post partum, cholestatic jaundice, migraine, allergic rash, rise in blood pressure in susceptible individuals, mental depression.

Although the following adverse reactions have been reported in users of oral contraceptives, an association has been neither confirmed nor refuted: anovulation post treatment, premenstrual-like syndrome, changes in libido, changes in appetite, cystitis-like syndrome, headache, nervousness, dizziness, fatigue, backache, hirsutism, loss of scalp hair, erythema multiforme and nodosum, hemorrhagic eruption, itching. The following laboratory results may be altered by oral contraceptives: hepatic function: increased sulfobromophthalein and other tests; coagulation tests: increase in prothrombin, Factors VII, VIII, IX and X; thyroid function: increase in PBI and butanol extractable protein bound iodine, and decrease in T^3 uptake values; metyrapone test; pregnanediol determination.

What's Polycillin® (ampicillin trihydrate) got to do with the price of bananas?

Just this: According to the U.S. Bureau of Labor Statistics, bananas are one of the few things that actually cost less today than five years ago. The same is true of Polycillin. In fact, the price of Polycillin has been reduced about 30% since its introduction in 1963...making it, according to national surveys of patient costs, as economical as leading brands of tetracycline and erythromycin.

And Polycillin is available in a variety of dosage forms for your patients—more than any other ampicillin. It comes in 250 mg. and 500 mg. capsules; in convenient, chewable tablets of 125 mg; oral suspension, 125 mg. and 250 mg. per 5 ml.; and in pediatric drops, 100 mg. per ml. Also available parenterally as Polycillin-N (sodium ampicillin).

172nd ANNUAL MEETING

Medical and Chirurgical Faculty of the State of Maryland

APRIL 1, 2, 3, 1970

The scientific sessions of the 1970 Annual Meeting will be held at the Alcazar in Baltimore. Scheduled to present papers are

Daniel M. Gordon, MD
Associate Professor of Ophthalmology
Cornell University Medical College
New York

George James, MD, Dean
Mount Sinai School of Medicine
New York

Roy W. Menninger, MD, President
The Menninger Foundation
Topeka, Kansas

William H. Moretz, MD, Chairman
Department of Surgery
Medical College of Georgia

John Rock, MD
Clinical Professor Emeritus of Gynecology
Harvard Medical School
Director, Rock Reproductive Clinic, Inc.
Cambridge, Massachusetts

Felix Wroblewski, MD
Associate Professor of Clinical Medicine
Cornell University Medical College
New York

Medical and Surgical Grand Rounds will be presented by the Department of Medicine of The Johns Hopkins University and the Department of Surgery of the University of Maryland

Other activities scheduled are

Annual Round-Table Luncheon, which will include luncheon meetings of the alumni associations of several medical schools, and informal scientific discussions

Hospitality Night—this proved so very popular at the 1969 Meeting, that it will be repeated in 1970 at the Belvedere Hotel

Annual Presidential Reception and Banquet—at the Blue Crest North, well known for its delectable cuisine, hors d'oeuvres, and cocktails—in a delightful atmosphere with professional entertainment, and dancing for everyone

Scientific and technical exhibits will be on display each day of Annual Meeting at the Alcazar

Legalized Marijuana?

Anthropologist Margaret Mead, speaking before a Senate subcommittee in late October, condoned legalized marijuana, and suggested that the minimum age for its use should be 16. Saying that its effects are less harmful than alcohol, Dr. Mead criticized the hypocrisy of adults who deny adolescents their own form of escapism, and tell their children "not to smoke pot while they are holding a cocktail in one hand and a cigarette in the other." True, the hypocrisy exists. But why should legalized marijuana?

Instead of speaking about psychotropic drugs, including tranquilizers—the subject on which she was asked to testify—Dr. Mead, 67, used the opportunity to air her views on the topic of legalized marijuana, and seemed to consider herself somewhat an expert on the subject. It seems a bit hasty to assume that marijuana "doesn't lead to the excesses of behavior that alcohol does, and it does not have the toxic effects of cigarettes," and "I think talk of marijuana leading to heroin use is sheer fabrication." Are these statements supported by extensive research? Surely if modern doctors, scientists, and the general public had linked cigarettes to cancer and alcohol to "excessive behavior" earlier, these "necessities" would have long since been outlawed, long before they became so much a part of our culture. Only recently has the problem of marijuana come into focus and have studies been conducted. Certainly such a controversial drug as marijuana warrants further tests before it can be legalized.

Dr. Mead stated that she tried marijuana once, but did not "find it something I need. But if I were young today I'm sure I would be using marijuana." But, if Dr. Mead did not "need" the drug, why would she now be using it? As yet, it has no proven beneficial use. Why should 16-year-olds choose to, and be allowed to, legally gamble with such a possibly harmful drug?

If then, Dr. Mead favors legalization, and would be using the mind-expanding drug, what comment does this make on our society? Is the escape of reality the ultimate goal? Certainly, overcrowding and the quickening pace of everyday life has added tensions to our modern world. But Dr. Mead has gone so far as to advocate the everyday use of pills, and marijuana, to relieve the unnecessary tensions and frustrations. Dependence on such drugs can only lead to dangerous self-deception. Every day, television offers children an escape from reality, into a world of never-never land. Why should we encourage and even legalize yet another reality-escaping mechanism?

Dr. Mead, come down to earth!

DJA

THE CHANGING STATUS OF *ADOLESCENTS* *IN THE* *MODERN WORLD*

If we examine human development, as the human species became established as the species we know today, one of the most interesting developments has been the changing lengths of the various portions of the life cycle, as the period of early maturation was extended and human beings attained greater longevity. Among these developments, the postponement of puberty is one of the most important. This postponement allowed a longer period in which children, untroubled by the urgencies of puberty, could devote themselves to mastering the increasingly complex human culture. Today, children are reaching puberty at an earlier age, and the roles of children, young people, and adults in the present-day world are rapidly changing.

MARGARET MEAD, PHD
Curator of Ethnology
The American Museum of Natural History
Adjunct Professor of Anthropology
Columbia University
New York

Many hundreds of thousands of years ago, human beings probably reached maturity at a much younger age, possibly as early as age nine or ten. The implications of such precociousness are found in *The Lord of the Flies*, which details the cruelty which may accompany the giving of power to young boys. Within such a context, we can better understand this crisis occuring at age five or six. Psychoanalysts call this the age of the Oedipus Complex, and it occurs in some form all over the world. Superficially, it seems to make sense for a child of this age to challenge his father, or for his father to respond with rage to this challenge. But, unlike earlier generations, when a six year old might have to wait, not ten years, but only two or three to achieve his full strength, this challenge to adults, today so premature, becomes more intelligible. For a mature 9 year old to challenge aging 20 year olds for the available supply of women is no more unintelligible than for young men of 20 to be restive under the control of men of 60.

During the course of the development of the human species—we do not know, and we may never know, just when or how—maturation was prolonged and a significant pause was introduced between the development which we now see at age six, and puberty. Psychoanalysts call this pause latency. It gave children a period of relative freedom in which they could learn all the basic things their society required them to learn—to hunt and fish, to build houses, and as civilization advanced, to read and write and figure, and learn to handle more and more complicated ideas. It gave the human race more time to explore the capabilities of the very powerful brain, a brain that has still not been used to anywhere near its full capacity. We can hypothesize that if any human or pre-human groups failed to develop this period of latency and learning, they would have been obliterated by those who did.*

We used to believe that primitive peoples were somehow inferior to ourselves, being less fully evolved, and reaching puberty earlier than modern civilized man. But we know today that not only were primitive people members of the same human species, without socially relevant differences from ourselves, but also that it is in civilization that young people are reaching puberty earlier and earlier. The age of puberty is dropping four months a decade, and has been doing so since the end of the last century.

This may be one of the most serious biological problems that will face mankind. We may have to develop ways to slow down maturation, if we are going to preserve this invaluable period of freedom to learn. As puberty occurs earlier, children are consequently growing taller earlier. One of the factors that is complicating the relationship between adults and young people in this country today is that seventh graders now look like college students. This distorts adult perceptions concerning their intellectual and physical maturity.

As we began to seriously study child development, some specialists found it useful to speak of the period of six-year-old crisis as a first adolescence, and puberty a second. This makes it possible to speak of a third or fourth or fifth adolescence, as longevity is increased and social conditions permit change and growth well into the adult years. Adolescence then becomes the name for the crises that occur between the periods of physical growth and the development of roles and choices within a given society.

Now that our focus is changing, we can give more attention to possible physical changes—in addition to menopause—which may trigger these social-psychological crises. European research workers have suggested that such a period occurs at about the age of 29 in women, for example.

As society becomes sufficiently complex to stimulate and provide for lifelong intellectual and emotional growth, it may be that everyone will die in some sense immature, with unrealized possibilities. The longer the life span, the more crises there will be, crucial points where individuals will want to change their careers, their mates, their ecological niches. Such a view of puberty, as the second adolescence, changes our understanding of what is happening to the young. If we are to understand the significance of puberty, we have to know where it stands, not only in relation to birth, but also in relation to death.

In very simple primitive societies, at the hunting and gathering stages, children have learned everything that they need to know to survive by the time they are six or seven. A few years later, they marry and function as full members of society. Puberty is not a crisis of choice and self appraisal for them, but simply the time to get married and become full members of society.

As society became more complex, it was impossible for six and seven year olds to either comprehend or master the physical and intellectual skills necessary to function in and manage social life. Today it is impossible for 14 and 15 year olds to do so. We have been building societies in which individuals need a longer period of preparation to understand the world in which they live. And while they are learning, they need protection and support. The crisis in American education today stems from our failure to prepare millions of children to function in a complex urban, rather than in a simpler rural society.

**For a fuller discussion of the possible mechanisms through which this evolutionary change may have occurred, see* "Totem and Taboo Reconsidered with Respect," *by Margaret Mead, in the* Bulletin of the Menninger Clinic, *27, No. 4 (July, 1963), 185-199.*

During the last two decades, however, as the demand for higher education has grown, we have also been forcing young people to marry early to prevent illegitimate births. When we abandoned the chaperonage of young people, we began substituting premature marriage as a way of dealing with the ethics of the situation. Yet, all our records show that marriages between young people in their teens are usually unstable and unsatisfactory, and that teenagers are unprepared for the responsibilities of parenthood. As a society, we may, of course, decide to deal with this matter by treating marriage, and possibly even parenthood, as part of higher education. Years ago, many eastern European Jewish boys were married at 14 or 15, but the young couple was completely supported by their parents, as the boy continued his studies. In many aristocracies, the children marry early, supported and surrounded by numerous tutors and retainers.

We seem very close to deciding that mating should become a part of higher education, as we build coeducational dormitories and remove more and more paricta1 restrictions. But if we are to make parenthood a part of higher education, then it will be necessary to provide a great deal of auxiliary help for the young parents, instead of leaving them, as we do today, to struggle with the economic, as well as the emotional problems of parenthood. If we decide to do this, we should include the bearing of two children within the educational period necessary to prepare for a professional career, and provide nursery schools and baby sitters. The tendency of young women today to view the period of motherhood as something to be completed as soon as possible, combined with the demand for smaller families in response to the population explosion, may aid in developing educational institutions of this sort.

We will have to seriously examine the means that would be used and the consequences incurred when intervening in this process of earlier and earlier puberty. We may decide that the latency period has been, and still is, invaluable, and that it should be further extended physiologically, rather than be allowed to contract. Or we may decide that if mating and parenthood are sufficiently protected so that they do not place too much of a strain on the young while they are learning, we can extend latency educationally, rather than physiologically. This is what the Russians have done, by postponing an active concern with sex so that their young people have enough time to fully complete their education.

We must, however, also study the present world. This period is unique. The technological changes which are characteristic of today's world carry with them tremendous ethical implications. The bomb has changed warfare from an event that kills and maims millions, to a political event which can destroy the whole of mankind. We have become the keepers of the future, not only of our own country and continent, but of the whole world. This has profoundly affected our young people. They, far more fully than we ever can, now appreciate the significance of these changes.

Many commentators have described the present youthful unrest as part of the normal adolescent rebellion, complicated in the United States by affluence, permissiveness, the draft, civil rights, and the war in Viet Nam. I do not agree. True, in every society there are adolescents, and society has to come to terms with their burgeoning sense of themselves. Some societies have been stern, and some lenient. The only connection the present unrest has with adolescence is that the present generation gap is occurring at, or soon after, the onset of puberty, as this is the period when young people usually leave home for school or work and become sensitive to what has happened since World War II. World War II was the breaking point. Since then, change has come so fast that adults have not had time to assimilate the knowledge and teach it to the young. Five years ago, the realization of this gap had reached the colleges; today it has reached the high schools, and so coincides more and more closely with the normal generation conflict that arises in puberty. But it is not due to puberty; it is not simply adolescent rebellion. It is something very different and far more serious.

Throughout recorded history, there have been changes which have profoundly altered the relationship between generations. But the changes have come slowly; the adults had time to learn how to handle the new inventions and to teach their children how to use them. Today, there are so many changes occurring all over the world that adults cannot keep up with them. Young people—more mature, and in many ways better educated than any previous generation—realize that there are no adults anywhere who know how to manage the present world. Since none of them grew up within it, the adults who grew up before World War II speak what is essentially a different mother tongue than the young people who grew up afterwards. What understanding our generation has of space and world-wide TV, of the implications of the bomb, the population explosion, and the universal threat of pollution is like the understanding one has of a second language, learned as an adult. For the children, all this is their mother tongue. Where we counted to 500 by fives: "5, 10, 15, 20 . . . 500 and all around my base are caught," they count 10, 9, 8, 7, 6 . . . . We are immigrants from another time, instead of another continent, trying to live in a world we never knew as children.

This is one reason that education is breaking down.

Previously schools worked, no matter how archaic they were, as long as the teachers themselves had learned in the same ways that they were expected to teach. But today, there are no teachers who learned the material that they must now teach their pupils: mathematics, geography, ethics, and biology have changed dramatically within the past few years. The world has been transformed by a generation who was not given time to fully assimilate it. This is why the young people of today will never understand the Depression. Only it isn't the Depression; it is the radical change in every part of today's world, in every country, at every level of technological development.

One morning at the Maryland Institute of Design, a student commented on what I had just said about the Manus people of New Guinea skipping 2,000 years and coming into the modern world. He raised the perfectly logical point that they had somewhere to go, models of what they wanted to be. But the young people in highly developed countries like the United States, Western Europe, the Soviet Union, and Japan, are the first generation on the edge of the greatest technological change the world has ever known. They have no models. They have no blueprints. The only models they have are from science fiction, from the prophecies and laments of those who have never known today's world as the young know it. We criticize them for having no program, because in the past, the radical reformer or revolutionary adults could present the radical young with programs. Today, when they search for adult heroes, the young find them in revolutionaries who died early, or in anarchists, notable for their lack of program.

It is only since the 1940's that there has been any widespread acceptance of the problems peculiar to puberty, and the conflicts between parents and children which are characteristic of puberty. We then began popularizing what was known about adolescence, telling young people what they were going through, and just how awful it was. Since that time, there has been an enormous popularization, and vulgarization, of the scientific findings on human growth and development, from the proper behavior at two months to the proper forms of musical appreciation or dress or riots at sixteen. We have been categorizing young people, putting them in narrow age bands, labeling them—sociologically, psychologically, psychiatrically, anthropologically—talking about their search for identity, their apathy, their role diffusion. The mass media have popularized prescriptions for the whole country, with careful notes on how hippies differ from yippies, or diggers. In the 1920s, girls ran away to Greenwich Village, but their families hushed it up; there was no mass media exposure which led dozens of other girls, with no natural bent for Bohemia, to follow them because it was the thing to do. Today, hundreds of thousands of youngsters are drawn into single styles propagated by the mass media.

Today's children have been raised by mass media; they live in a world that is made possible by the mass media, binding all young people everywhere in the world together. But they are trying to build something different. They plead for greater person-to-person intimacy, for love, for humanity. They want real, significant contact with others, not merely contact on the TV screen, or school-closed TV; they want meaningful participation.

The young people's demands for more participation is related, in part, to the demands of any previously excluded group—ethnic minorities, religious minorities, women, the retired—for a voice in the society. They are asking to be recognized as those who have a unique stake and a unique contribution to make. And significantly, it is not the children of excluded groups, but the children of the most established, those closest to the seats of power, who are clamoring for a voice *Now*, not 20 years from now. They are unwilling to wait. They watch and do not trust their elders who are fumbling in a world they do not understand. Until now, it was possible to say, "Wait, wait, in 20 years you can have it your way." The answer of the young today is, "We are not sure there will be a world in which to have our way, unless you listen to us now."

But the facts of physical growth and maturation are still there. Stubborn facts: Young people at puberty have all the characteristics that young people at puberty have ever had. They are faced with their relationships to themselves, to the opposite sex, and to their parents, just as they always have been. In addition, they carry this new burden. They are the only ones to have grown up as natives of this new post World War II world. They desperately need our help and protection, our technical and political know-how, outdated as it is, and we as desperately need their questions, and their challenges.

An edited transcription of an address delivered at the 1968 Fall Symposium on "The Twentieth Century Adolescent," November 13, 1968. An amplification of this discussion on the generation gap will be published by the Natural History Press as Culture and Commitment, *The Man and Nature Lectures of The American Museum of Natural History Lectures, Series V.*

Cephaloridine Dosage in Infants and Children

STUART H. WALKER, MD
Associate Professor of Pediatrics
University of Maryland School of Medicine

VICTORIA T. MAISOG, MD
Fellow in Pediatrics
Mercy Hospital

Cephaloridine, a semi-synthetic derivative of cephalosporin C, possesses the same range of antibacterial effectiveness as other cephalosporins, but produces less tissue reaction when injected intramuscularly, is less serum bound, possesses a longer serum half-life, and appears to penetrate the bacterial cell more rapidly.[1-3] Cephaloridine has been demonstrated to be regularly effective in the treatment of gram-positive coccal infections, and less regularly effective in the treatment of gram-negative bacillary infections.[4,5] Toxic reactions have not been reported frequently, but occasional instances of hypersensitivity, and possible nephrotoxicity and hepatotoxicity have been recorded.[6-8]

The study reported below was designed to evaluate the effectiveness and toxicity of this agent at varying serum levels, and at varying dosage schedules in infants and children.

Material and Methods

During the period from April 1966 to August 1967, 67 patients who were admitted to the Pediatric Service at Mercy Hospital in Baltimore were entered into this study. All were suffering from an infectious disease which was presumed to be due to an organism sensitive to cephaloridine. An additional 13 patients were treated expectantly because of the likelihood of systemic infection. Cephaloridine was administered in two dosage schedules: 50mg/kg/day to 10 patients, and 100mg/kg/day to 39 patients. The dosage was given intramuscularly or intravenously in equally divided doses at six-hour intervals during the first part of the study. Later, it was administered in a dosage of 200mg/kg/day to 15 patients, and to three patients at 400mg and 600mg/kg/day. Additional therapy was provided as indicated, and did not vary significantly from usual management procedures. Additional antibiotics were not given, except when cephaloridine failed to control the infectious disease.

From the isolation of a pathogenic organism from cultures of blood, cerebrospinal fluid, urine, or needle aspirate, it was determined that 37 patients had specific infection. Of these, 21 had systemic infections, while infections in 16 were superficial or localized. Disease was discovered in 30 patients, presumably with an infection of a cephaloridine sensitive bacterium. However, no pathogenic organism was directly isolated.

Cephaloridine was administered intramuscularly, until complete resolution of the signs and symptoms of disease. A complete blood count, urinalysis, serum glutamic oxalacetic transaminase (SGOT) determination, and blood urea nitrogen (BUN) determination were performed on all patients at the time of initial therapy. Afterwards, the tests were given at weekly intervals, and finally, at the termination of therapy. The minimum course of therapy was four days.

Demonstration of the presence of infection in each patient was attempted by culture of blood, urine, stool, cerebrospinal fluid, nasopharyngeal secretion, or available exudate at the site of infection. Pulmonary infections were evaluated by percutaneous lung aspiration. Only those patients from whom pathogenic organisms were isolated by blood or aspiration cultures were considered definitely to have infection. Culture of appropriate material was repeated periodically to demonstrate eradication of infection.

Specimens for assay of the cephaloridine content of the serum of all treated patients were obtained at various times after the initiation of therapy, and at various intervals after the most recent dose. In appropriate patients, specimens were obtained for assay of the cephaloridine content of pleural exudate and cerebrospinal fluid. All assays were performed by the Lilly Laboratories for Clinical Research by the cup-plate method using *Sarcina lutea* as the test organism.

The sensitivity of all pathogenic isolates was initially determined by the single disc-agar plate method. The sensitivity of H.influenzae isolates from patients with meningitis was subsequently determined by the tube dilution method.

Results

After detection, staphylococci, pneumococci, and group A betahemolytic streptococci were eradicated in all the patients who were treated, and all such patients recovered. These patients included five with staphylococcal pneumonia, three with staphylococcal sepsis, three with pneumococcal pneumonia, two with pneumococcal meningitis, one with alpha-hemolytic streptococcal meningitis, and one with beta-hemolytic streptococcal sepsis. One patient with sepsis, due to Salmonella Heidelberg, relapsed after five days of therapy, but the organism was eradicated after ten days of additional treatment. Two other patients with mixed infections in the urinary tract—one a combination of *P.mirabilis* and *E.coli,* and the other a combination of *S.aureus* and *E.coli*—responded satisfactorily with eradication of infection.

Three patients with H.influenzal meningitis failed to respond adequately to cephaloridine in dosages ranging from 100 to 600mg/kg/day, although the organisms isolated were inhibited in diluted inocula in vitro (tube dilution method) by concentrations of 0.8μg, 3.2μg, and 7.5μg/ml. Each patient demonstrated a rising temperature, increasing depression of perceptual and motor abilities, and the persistence of H.influenzae in cerebrospinal fluid cultures after an initial 48-hour period of improvement. Cephaloridine was discontinued and ampicillin was instituted with substantial improvement in each.

All of the isolated strains of pneumococci, streptococci, staphylococci, P.mirabilis, and E.coli were considered to be sensitive by the single-disc-agar plate method.

Among 30 patients with infectious diseases of unknown origin, all but one recovered without incident following treatment with cephaloridine. This one patient had interstitial pneumonitis in association with progressive respiratory failure due to Werdnig-Hoffman paralysis. Thirteen patients, chiefly newborns, were treated expectantly because of the increased likelihood of bacterial infection. Infection did not occur in any patient so managed.

No significant toxic reaction to cephaloridine was detected. A transient increase (a rise greater than 20 units) in the SGOT concentration occurred in three patients, one of whom was receiving cephaloridine in a dosage of 400mg/kg/day. No other evidences of hepatic injury appeared in these patients, nor in any others. An elevation of the

BUN concentration occurred in one infant with H.influenzal pneumonia, but returned to normal when therapy was continued. One patient complained of pain and demonstrated slight inflammation where the drug had been injected intramuscularly. The transient chemical alterations detected were not correlated with the dosage administered.

The analyses of serum for cephaloridine content, after varying the dosage at six-hour intervals, revealed a direct correlation between dosage and serum concentration in older infants and children. In newborns, however, serum concentrations were extremely variable (Fig. 1). In some newborns, high serum concentrations persisted for three to four hours, and were as high, or higher than the peak levels achieved in older infants and children at twice the dosage. In the majority, serum concentrations were in the range of 10-20μg/ml throughout the six-hour period, following a dosage of 50mg/kg/day administered intramuscularly. In two instances, the serum concentration was 8 and 16μg/ml six hours after injection.

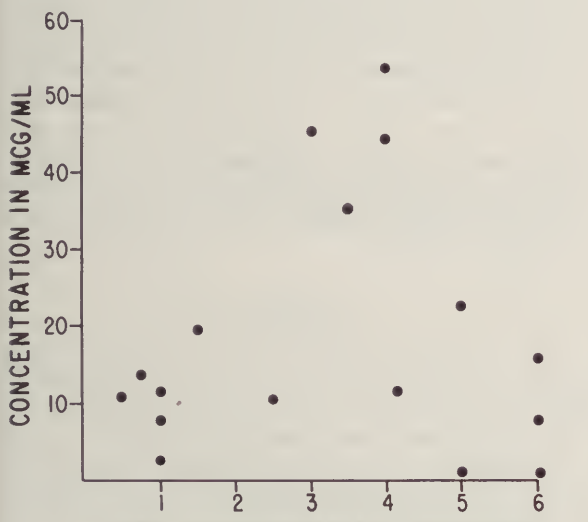

FIGURE I. SERUM CONCENTRATION OF CEPHALORIDINE IN NEWBORNS GIVEN 50mg/Kg/24 HOURS INTRAMUSCULARLY.

In infants of four weeks to two years of age, who were given cephaloridine intramuscularly in a dosage of 100mg/kg/day, peak serum concentrations were reached within the first two hours. This was approximately 30μg/ml (Fig. 2). The first half-life of the serum concentration in these patients was approximately three hours; and during the sixth hour concentrations were consistently less than 4.0μg/ml. At this dosage, the average concentration from the second to the sixth hour was less than 10μg/ml.

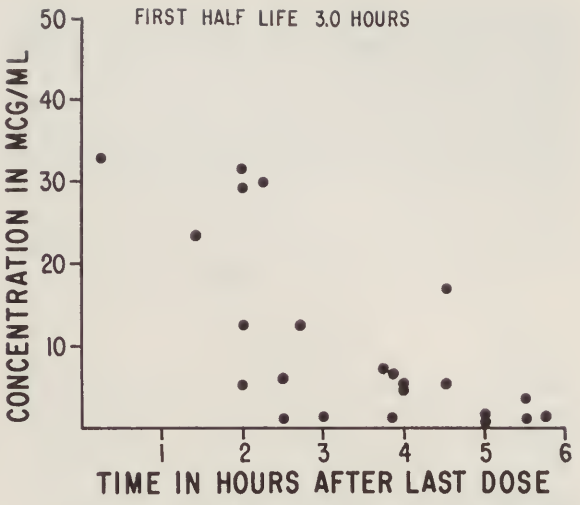

FIGURE 2. SERUM CONCENTRATION OF CEPHALORIDINE IN INFANTS (4 WEEKS-2 YEARS) GIVEN 100 mg/Kg/24 HOURS INTRAMUSCULARLY.

Similarly, when children over two years of age were given cephaloridine intramuscularly in a dosage of 100mg/kg/days, peak serum concentrations were achieved in the first 2½ hours, which was approximately 30μg/ml (Fig. 3). During this period, however, the range of concentration was wide—4.0 to 47μg/ml. The first half-life of the serum concentration in these patients was approximately 2.2 hours; during the sixth hour, concentrations were consistently less than 6.0μg/ml.

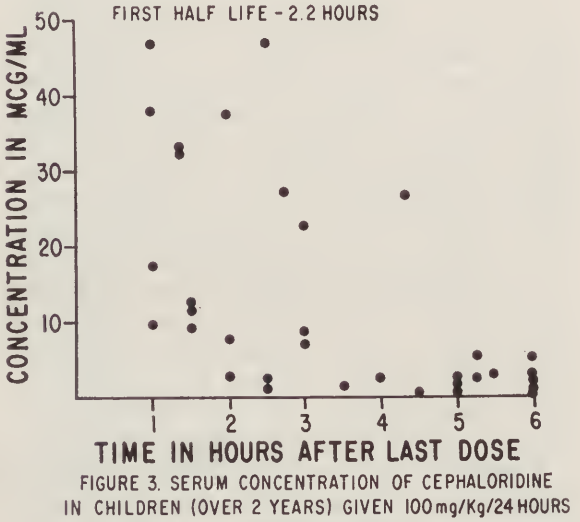

FIGURE 3. SERUM CONCENTRATION OF CEPHALORIDINE IN CHILDREN (OVER 2 YEARS) GIVEN 100 mg/Kg/24 HOURS INTRAMUSCULARLY.

Peak serum concentrations were achieved within the first four hours when infants of four weeks to two years of age were given cephaloridine intra-

muscularly in a dosage of 200mg/kg/day. This was approximately 50μg/ml (Fig. 4). The first half-life of the serum concentration in these patients was approximately 2.1 hours; during the sixth hour, concentrations were consistently less than 6.0μg/ml. At this dosage, the average concentration from the second to the sixth hour was 19.2μg/ml.

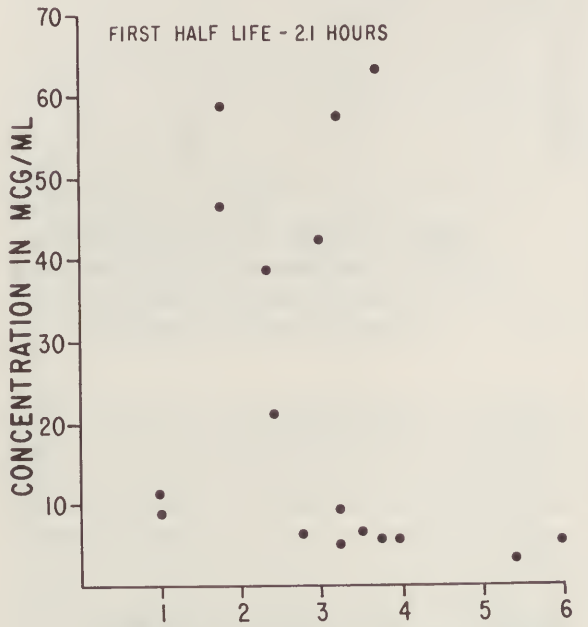

FIGURE 4. SERUM CONCENTRATION OF CEPHALORIDINE IN INFANTS (4 WEEKS-2 YEARS) GIVEN 200 mg/Kg/24 HOURS INTRAMUSCULARLY.

There was little difference between the average serum concentration achieved and the half-life of this concentration in infants four weeks to two years of age, and in children over two years of age when given a dosage of 100mg/kg/day (Fig. 5). In both groups, the average serum concentration was highest within the first hour after intramuscular injection. It fell rapidly to less than 5μg/ml at the end of four hours, and remained at lower levels thereafter.

After injection, with multiple doses at six-hour intervals, there was no evidence of accumulation of cephaloridine. Prior to assay, patients who had several days of therapy showed no consistent elevation of cephaloridine serum content above that detected in patients who had received but one dose.

Examination of the cephaloridine content of pleural exudate obtained from a patient with staphylococcal pneumonia revealed concentrations of 8.0μg, 12.5μg, and 14.4μg/ml between 150 and 180 minutes after dosing at 200mg/kg/day. These concentrations are comparable to those found in the serum under similar conditions. Assay of the cephaloridine content of the cerebrospinal fluid in three

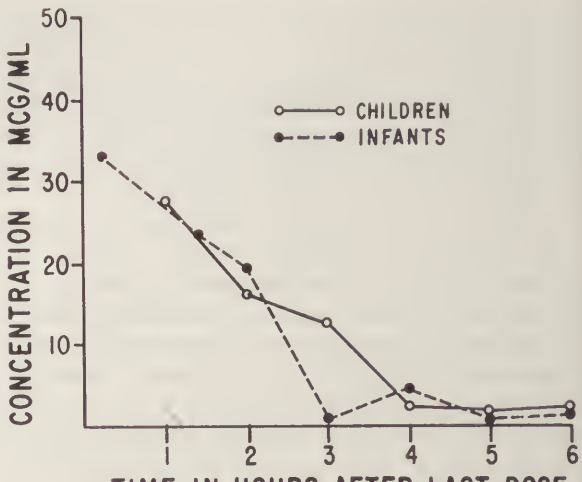

FIGURE 5. COMPARISON OF SERUM CONCENTRATIONS OF CEPHALORIDINE IN INFANTS AND CHILDREN GIVEN 100 mg/Kg/24 HOURS INTRAMUSCULARLY.

patients who did not have meningitis revealed concentrations of less than 1.0μg/ml in each, in the presence of serum concentrations ranging from 11.4 to 38.7μg/ml. Cerebrospinal fluid concentrations during the second, third, and fourth days of therapy of two patients with bacterial meningitis ranged from 13.6 to 104.0μg/ml, when serum concentrations ranged from 41.8 to 108.2μg/ml. On the fifth, sixth, and ninth day of resolving bacterial meningitis, cerebrospinal fluid concentrations ranged from 0.98 to 5.2μg/ml when serum concentrations ranged from 5.5 to 24.4μg/ml.

Discussion

In this study, cephaloridine was consistently effective in the management of proven gram-positive coccal infections and infections presumably due to such agents. It was inadequately effective in the management of Hemophilus influenzal meningitis. In vitro studies have demonstrated that group A beta-hemolytic streptococci and pneumcocci are regularly killed by cephaloridine concentrations of less than 1.0μg/ml.[1,9] Some strains of Hemophilus influenza are resistant to concentrations in excess of 25μg/ml.[9,10] Kislak, et al[1] and Steigbigel, et al[5] have demonstrated that inoculum size is a major determinant of sensitivity to cephaloridine. It is likely that heavy inocula at the site of H.infleunzal meningitis impaired the effectiveness of cephaloridine, even though the organisms were demonstrated to be sensitive in vitro in diluted inocula to the concentrations achieved.

The serum concentrations achieved by dosage at 100mg/kg/day were continuously in excess of those required for bactericidal effect against gram-positive cocci throughout the six-hour period following dos-

ing. However, 30% of strains of *E.coli*, 20% of strains of *P.mirabilis*, and the majority of strains of *Klebsiella* are resistant to 12.5μg/ml. of cephaloridine in undiluted inocula.[5,9] (All other strains of Proteus and all Pseudomonads are completely resistant.) Even the 200mg/kg/day dosage in infants did not regularly provide an average serum concentration greater than 12.5μg/ml. during the first four hours after dosing; although it did so more frequently than did the 100mg/kg/day dosage. Between four and six hours after dosing, serum levels in both infants and children usually were not greater than 6μg/ml at either the 100 or 200mg/kg/day dosage. Cephaloridine administered in these dosage schedules should not be relied upon in the management of systemic gram-negative enteric bacillary infections.

A dosage of 50mg/kg/day often produced serum concentrations in newborns as high as did a 100, or even 200mg/kg/day dosage in older infants. In newborns, the average serum concentration between four and six hours after injection at this dosage was approximately 10μg/ml. Although only a small number of patients was studied, it seems reasonable to presume that the expected decrease in renal excretion of cephaloridine in newborns does permit the maintenance of adequate serum concentrations at lower dosage and for longer periods than in older infants and children.

The serum concentrations achieved in the older infants and children of the present study are similar to those detected in a similarly-treated pediatric population by Flux, et al.[11] They are comparable to those achieved at similar dosage in adults.[4,9] Peak concentrations in adults have been reported occurring between 30 and 60 minutes with a half-life between 48 and 90 minutes.[1,6] The longer half-life detected in these infants and children may reflect some decrease in renal excretion persisting beyond the newborn-period. This is consistent with the extended half-life detected in aged patients and those with elevated BUN concentrations by Apicella, et al.[14]

Penetration of cephaloridine into pleural and cerebrospinal fluid was excellent in the presence of inflammation. Concentrations at these sites in patients with empyema and early meningitis were between 30% and 100% of simultaneous serum levels. In the absence of inflammation, however, cerebrospinal fluid concentration was between 1% and 10% of serum concentration. During the early recovery from meningitis, cerebrospinal fluid concentration was approximately 20% of serum concentration. This pattern is typical of the pattern of the penetration of the pharmacologically-similar penicillin molecule in body fluids.[12]

No significant toxicity attributable to cephaloridine was detected in this study, nor in the study of pediatric patients by Flux.[11] Skin rash has been reported as an indication of hypersensitivity in 1% to 4% of various treated groups.[4,7] One study detected frequently transient elevations of SGOT concentration and of prothronbin time.[7] However, most investigators have failed to detect any evidence of hepatotoxicity. Renal tubular necrosis in rats has occurred after large doses of cephaloridine, and nephrotoxicity has been suspected in four reported adult patients.[2,6,7,8,13]

Summary

Eighty newborns, infants, and children were treated with cephaloridine administered intramuscularly at varying dosages. Adequate serum concentrations and clinical effectiveness in the treatment of gram-positive coccal infections were achieved in older infants and children at a dosage of 100mg/kg/day administered intramuscularly at six-hour intervals. Dosage of 200mg/kg/day was well tolerated in all of the infants and children so treated and produced serum concentrations approximately twice as great as a dosage of 100mg/kg/day. In newborns, a dosage of 50mg/kg/day resulted in serum concentrations comparable to those achieved at twice the dosage in the older infants and children. No significant toxicity was detected at any dosage level. (Table 1.)

Sudden Unexpected Death in Infants

GILBERT E. CORRIGAN, MD, PhD
Former Research Fellow in Forensic Pathology
Assistant Professor of Pathology
University of Texas—Medical Branch
Galveston, Texas

with a preface by RUSSELL S. FISHER, MD
Chief Medical Examiner for the State of Maryland

Sudden unexpected death in infancy, or crib death, as it is frequently called, is responsible for nearly half of all deaths in infants between the ages of 3 weeks and 12 months. Although the examination of cytological specimens from the tissues and organs studied at autopsy is not a routine procedure, such an examination is made in cases of sudden unexpected death (SUD), since the results of such histological studies are often equivocal and debatable.[1]

Preface

The following table shows the statistics for incidences of crib death in Maryland in 1967.

Age	Not SDII	SDII	Total
Under 2 months	61	42	103
2-3 months	25	44	69
3-4 months	21	31	52
4-6 months	28	33	61
6-12 months	59	14	73
	194	164	358

The cases shown in the "SDII" column include infants who, prior to death, had no known significant congenital defects and were not recognizably suffering from any major disease, or did not present any serious growth or developmental deficiencies. Seemingly healthy, infants such as these are either found dead in their crib or, if under observation, die within minutes after the onset of signs of respiratory or circulatory distress. Nearly all become Medical Examiner's cases, and in the absence of a recognizable cause of death, an autopsy is performed. In the event that the post-mortem examination reveals unsuspected serious congenital anomaly or sufficient

pathological findings to explain the death, the case is relegated to the "Not SDII" category, although in some of these cases, the immediate cause of death must be the same as in the SDII cases. Also included in the SDII category are those cases that exhibit isolated acute otitis media, focal scanty bronchopneumonia, or other respiratory conditions not accompanied by gross disease, and not ordinarily accepted as a cause of death.

The theories offered to explain SDII are many, ranging from status thymicolymphatius, allergy to cow's milk, smothering in the bed clothes, postural asphyxia suffered by simply resting the face on a pillow, laryngeal spasm due to a calcium metabolism deficiency caused by a lack of vitamin D in the mother during her pregnancy, secret homicidal asphyxia due to maternal mental illness, asphyxia due to mucosal swelling with occlusion of the nasal airway in infants who have not learned to mouth-breathe when necessary, to overwhelming bacterial or viral infection so acute that the body shows no pathological signs of its presence in the short interval between onset and death. However, none of these theories is adequate to solve the problem of why these infants die. The following study, reported by Dr. Corrigan, presents additional evidence indicating that infection somehow leads to the sudden death of healthy infants.

Introduction

The cytological examination method is limited both by the lack of standards for determining the normal cytology of the organs of the human infant, and by the autolysis present in the smears and imprints obtained. However, the advantage of examining the specimens lies in the extension of the morphological parameters of the tissues and organs. A smear of the lining mucosa of an organ allows the examination of a greater number of mucosal cells than does a cut section. It also permits a more facile determination of the nature of the cells present. In addition, the inflammatory and reactive cells present on smears are more readily recognized and typed than are those in histological section. It is common knowledge that in the evaluation of certain types of neoplasms, a properly fixed and stained imprint is of great diagnostic value.

The following study was undertaken not to establish absolute standards of reference, but rather to uncover reactive areas which are elusive in routine histology and so to promote new lines of morphological research. "We are confronted with a problem which demands the exploration of every avenue"—Lester Adelson.[1]

Materials and Methods

During a six-month period, cytological specimens were prepared at the time of autopsy from 25 infants (two controls) whose deaths were investigated by the Medical Examiner's office of Maryland. Wooden applicator sticks were used to take smears of the mucous membranes of the conjunctiva, larynx, trachea, and bronchi. Imprints of the lungs, tonsils, thymus, spleen, kidneys, salivary glands, lymph nodes (thoracic and abdominal), caecum, leptomeninges, and bone marrow were made by direct application of the tissue to a clean slide. In addition, smears were made of the cerebrospinal fluid and the blood. The specimens were fixed immediately in 95% methanol. They were stained with Giemsa stain (1%) overnight and examined microscopically under ordinary light, both after preparation, and as composite groups. A latter series (ten cases) stained with the Papanicolau technique rendered results similar to those stained with Giemsa, but the results are not reported in this study.

The infants studied were all free from major disease prior to death and had few significant alarming symptoms. They were developing normally for their age and were free from obvious nutritional deficiencies. Those with major disease (ie—bacterial pneumonia) and with obvious congenital malformations at the time of autopsy were excluded from the study. Control cases were limited in number; an infant with traumatic abdominal hemorrhage and an infant with head injuries were used in the study. Most of the infants were two-to-four-months-old; none were older than eight months. Race and sex of the infants studied were distributed relatively evenly.[2]

These cases all exhibited peripheral cyanosis of the extremities, variable patterns of internal and external petechiae, expanded lungs of increased consistency, well developed thymic glands, and flattened adrenal glands. All were classified histologically by local department standards as having interstitial pneumonia. This latter diagnosis includes moderate pulmonary congestion and edema, small lymphocytic infiltrates about some major bronchi, thickening of the alveolar septae, and moderate to advanced infiltration of the septae with medium-sized lymphocytes and occasional polymorphonuclear neutrophils. In approximately half of the cases, cultures were made of the conjunctiva.

Results

The results from the examination of over 500 slides are best considered generally rather than by a detailed slide-by-slide review.

Acute and chronic inflammatory cell aggregates (polymorphonuclear neutrophils and lymphocytes) were present in practically all (20/23) of the smears of the respiratory tract. There were three exceptions in which no inflammatory cells were present. Interestingly, chronic inflammatory cells (small lymphocytes) were found in the tracheal smears of the two

control cases, but the remainder of specimens from the respiratory tract of these two infants were free of inflammation. There was a wide range of involvement.

The meninges, cerebrospinal fluid, and bladder mucosa were free of abnormalities, except for one case which exhibited increased numbers of lymphocytes in the meninges. The lymphopoietic tissues (tonsils, thymus, lymph nodes, spleen and caecum) were normal; the reticuloendothelial cells were free from bacteria and other organisms. Imprints of the salivary glands were characterized by the presence of bacteria on the surface and in the cytoplasm of large ductular cells. This phenomenon occurred in all specimens, but was variable both in the quantity of bacteria present and the number of cells affected.

The examination of the blood and myeloid tissues was restricted by post-mortem autolysis. The red cell series was normal; the myeloid series had an apparent increase in the number of eosinophils in the bone marrow. Autolysis of the materials studied prevented the analysis of this apparent increase. In addition, eosinophils were noted to be uncommon in the organ specimens studied, and in the conjunctiva.

Inflammatory cells, with or without engulfed bacteria, were present in all the conjunctival smears. The cells were almost exclusively polymorphonuclear neutrophils. Generally, a few lymphocytes were also present. Eosinophils, basophils, and plasma cells were absent. Conjunctival cultures revealed micrococci, pneumococci, H. influenza, and streptococci. However, the results of these cultures did not correspond with the results of the blood cultures.

Discussion

The incidence of acute and chronic inflammatory cells in nearly all of the samples of the respiratory system presents a higher index of inflammation than previously reported.[3] This is probably due to the larger number of samples made available through the use of cytology. The actual presence of infection cannot be extrapolated from these findings, however, for the respiratory system is known to bear a moderate reactive inflammation to both infectious and noninfectious toxic stimuli whose locus is extrarespiratory.

Although Muller [4] described changes in the lymphoid tissues of the spleen, tonsils, and lymph nodes, his findings have not been verified by others.[2] Nor does the present cytological examination of the lymphoid (reticuloendothelial) system bear any significant deviations from normal imprint lymphocytic populations. Indeed, the uniformity of these smears and imprints of the lymphoid tissues was a characteristic of the study.

The post-mortem invasion of the salivary ducts by bacterial organisms is a well established phenomenon. The presence of bacteria on the surface and in the cytoplasm of the large ductular cells of the salivary glands was thus considered a post-mortem artifact. It is possible, however, that this is an indication of a true ante-mortem bacterial infestation which was not sufficiently advanced to elicit a tissue response. Sialadentitis has been reported to occur in the SUD complex.[1] Interestingly, Bark and Perzik [5] have recently suggested that sensitization to infected salivary tissues may be a trigger mechanism for auto-immune phenomena.

The inflammatory cells (polymorphonuclear neutrophils) present in the smears of the conjunctival sacs are interesting, since they apparently always occur in such cases. There are few morphological entities in the SUD complex which have such a high incidence of occurrence. But the problem lies in the fact that while polymorphonuclear exudates of the conjunctiva are characteristically a result of bacterial infection, viral and physical-chemical attacks may produce similar exudates.[6]

Since this is a screening study that attempts to open new avenues of morphological study, the ocular manifestations of SUD should also be examined. In this light, the author sectioned a few eyes from infants with this syndrome but has been unable to verify any uveitis or other significant pathological changes in the eye. Examination of a larger series of specimens by a more competent observer is desirable.[7]

It is unfortunate that the study of the blood and bone marrow of these infants is so hampered by post-mortem autolysis. Stowens [8] has found that the number of eosinophils in the tissues is diminished; his observation has been supported in this study. Obviously, a well controlled study of the eosinophils of the blood, bone marrow and tissues of these infants is necessary (if it is possible to accomplish), if more conclusive evidence is to be obtained.

The absence of viral inclusions, giant cells, and other signs of viral activity in this series substantiates the known paucity of such findings on routine histological sections, and is in agreement with the low rates of viral isolation in infants dying from SUD.

Summary

This survey has demonstrated cytological changes only in the conjunctiva, salivary glands, and the respiratory system. Their relationship to the inflammatory response is also briefly discussed. It has added further evidence that there is a derangement of the eosinophils in infants dying from SUD. It prompts either a belief in the lethality of "minor" infections, or in the assumption of a "non-morphological" dysfunction of homeostatic mechanisms. Proof of this lies in the hands of histochemists, enzymologists, immunologists, neurochemists, and other molecular biologists.

Season and the Onset of Acute Childhood Leukemia

F. ROBERT FEKETY, JR., MD
Associate Professor of Internal Medicine
Department of Internal Medicine
University of Michigan Medical School

JAMES J. H. CAREY, MD
Department of Medicine
The Johns Hopkins School of Medicine

The hospital records of 96 children with leukemia seen at The Johns Hopkins Hospital were reviewed to determine whether there was any seasonal variation in the onset of the disease. By date of diagnosis, there was an excess of cases from June to September. By date of clinical onset, there was an excess of cases from May to August. Various artifactual causes of the phenomenon were considered, but were not supported. The seasonal variation was most prominent in children living in the Greater Baltimore Area, in Caucasians, in girls, in children with acute lymphocytic or stem-cell types of leukemia, and children whose parents were less than 35 years old.

Old age, the white race, the male sex, higher incomes, urban residence, the Jewish religion, and better access to diagnostic services have been associated with relatively high rates of leukemia. Exposure to radiation has been implicated in leukemogenesis in several different kinds of studies and particularly with myelogenous leukemia. Acute leukemia is primarily a disease of children and young adults, and leukemia is the most common childhood neoplasm. Lymphocytic or stem-cell leukemia are the most common types in children. The peak incidence of leukemia in white children is between the ages of four and six; this age-associated peak is not seen in Negro children, in whom rates are much lower. Higher rates are found in association with mongolism, and with advancing maternal age.[1]

Space-time aggregations of childhood leukemia (clusters) have been reported, and in one community has been associated with a high incidence of congenital heart disease, and with a benign rheumatic-like illness.[2] Such clusters require better statistical methods than are now available for interpretation.

These epidemiological observations have encouraged speculation that acute leukemia, in many cases, may be a disease caused by an infectious agent. The recent demonstration of virus-like particles of still uncertain significance in the blood or bone marrow of patients with leukemia, or allied conditions, has greatly increased interest in this hypothesis.[3] Of great interest in this context are several reports suggesting that leukemia in children varies in the frequency of its onset according to season.[4-8] However, these studies have yielded varying results. Some have shown a preponderance of cases beginning in the winter and early spring; [4, 5] others have shown an excess in the summer; [6-8] and still others have shown no seasonal effects.[9-12] No study showing a preponderance of cases in the fall has yet been reported. The possibility of artifacts is inherent in most of these reports. Some suffer from small numbers, from bias in the selection of cases, or from using death certificates as the source of information about the onset of the disease. In many, the date of diagnosis is taken as the date of onset of the disease, since the earlier manifestations of the disease were deemed too difficult to date precisely.

Because of such variables leading to difficulties in interpretation, we decided to review the detailed records of patients admitted to the hospital with leukemia to see whether we could add new understanding to the possible seasonal variations in the onset of leukemia in children.

Methods

Only leukemic patients less than 20 years old when admitted to The Johns Hopkins Hospital between 1950 and 1962 were studied; 107 patients were in this category. No records were obtainable for 11 (10.2%) of the patients. Our efforts to locate them have led us to conclude that these records are lost or misfiled, and are not being used in any other study of leukemia. The remaining 96 patients comprise this retrospective study. The hospital records of these patients were reviewed, and the diagnosis of leukemia was considered adequately documented by blood, bone marrow, or tissue studies, and by clinical course in every instance.

After careful review of the chart for clinical and demographic data, four dates were determined for each patient. First, *the month of diagnosis,* which was readily ascertained in all patients. Second, *the month of death,* which was not available in 31 instances. The reason for this is that many patients returned to their homes or other hospitals after diagnosis and initial therapy here, and were lost to recorded follow-up. Our analysis, therefore, is probably filled with cases having a relatively rapid course, although the cases lost were distributed evenly throughout the year (according to date of diagnosis). The third date, *the month of clinical onset,* is probably the most important one, since it represented the earliest date at which definite evidence of the disease was present. It should be emphasized that this term is not meant to imply the date at which the disease began. Few criteria used for assigning this date can be listed. The month in which definite evidence of the disease was most likely present was selected on the basis of all the available evidence. In most cases, the clinical onset of the disease was sudden, and the first sign of definite illness was followed by the diagnosis of the disease within a few weeks. In a few instances, anemia had been documented, but had defied diagnosis for several months. The earliest month of definite anemia in these patients was chosen as the month of clinical onset. The same can be said for hepatosplenomegaly in a few cases. The month chosen for the time of clinical onset was the first date at which objective abnormalities, attributable to leukemia, were documented. In 5 of the 96 patients, the onset of the disease was so gradual or inadequately described in the records, that no attempt was made to assign this date. The fourth event, *the date of first symptoms,* was the most subjective, vague, and probably least reliable, especially in this retrospective record review. In 12 of the 96 patients, the records were inadequate for this judgment, but it was surprising how often it was possible. This attests, perhaps, to the acute nature of leukemia in children.

Results

Seasonal Variation: The monthly distribution of cases for the four events studied are shown in Fig. 1 and Table 1. The most striking and significant finding is the large number of cases having their *clinical onset*

from May to August. Approximately 49% of the cases occurred during that four-month-period, and the number of cases exceeded the monthly mean in each of those four months. When compared with the rest of the year, this phenomenon seemed unlikely to be attributable to chance ($p < .004$). A relatively small number of cases had their clinical onset in September to November (17%). This may have differed significantly from the remainder of the year ($p = .05$), but did not differ from the period of January to April. It was of interest that presumed mumps parotitis was the initial manifestation of disease in five cases beginning in March. Never fully recovering from this illness, these children soon underwent diagnostic efforts which led to appreciation of the leukemic process. All of the cases beginning with parotitis had their onset in March.

A large number of cases were *diagnosed* between June and September (44.7% of the total), and it did not seem likely this was due to chance ($p < .03$). A relatively small number of cases were diagnosed in October and November, and February had a higher than average number.

There were two noteworthy peaks in *mortality* distribution: January to March and July to August. Little can be said about the distribution of cases according to *first symptoms*. An early summer peak is again suggested; a mean of 8.4 cases per month was noted during the first seven months of the year, but only 5.3 for the last five.

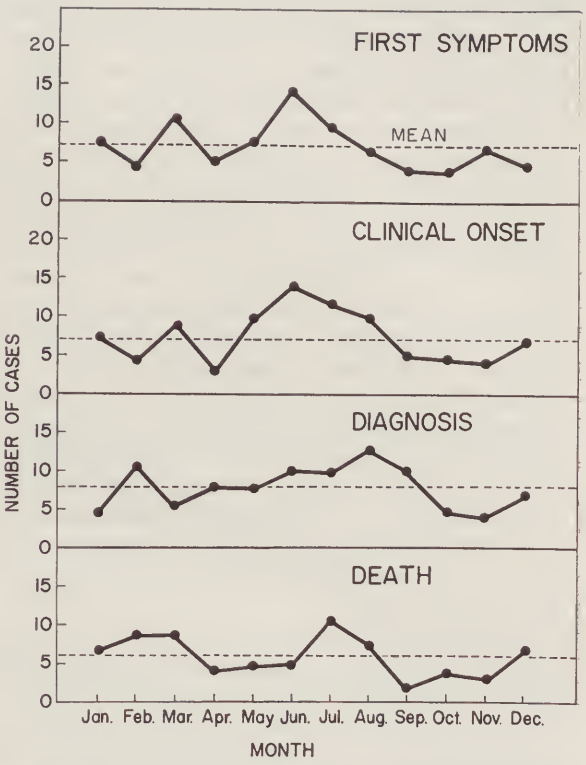

FIGURE 1: Monthly incidence of leukemia according to the four events studied. Data are adjusted to 30 day months.

TABLE 1: Seasonal Variation in the Onset of Leukemia

Month	Criteria Used to Determine Onset							
	First Symptoms		Clinical Onset		Diagnosis		Death	
	No.	%	No.	%	No.	%	No.	%
January	8	9.5	7	7.8	5	5.2	6	9.2
February	4	4.8	4	4.4	10	10.4	8	12.3
March	11	13.1	9	10.0	6	6.3	8	12.3
April	5	6.0	3	3.3	8	8.3	3	4.6
May	7	8.3	10	11.1	8	8.3	3	4.6
June	14	16.7	14	15.6	10	10.4	4	6.2
July	9	10.7	12	13.3	10	10.4	10	15.4
August	6	7.1	10	11.1	13	13.5	7	10.8
September	4	4.8	5	5.6	10	10.4	2	3.1
October	4	4.8	5	5.6	5	5.2	4	6.2
November	7	8.3	5	5.6	4	4.16	3	4.6
December	5	6.0	7	7.8	7	7.3	7	10.8
TOTAL	84		91		96		65	

This analysis suggested three things. First, acute childhood leukemia seemed to have a seasonal variation in its occurrence, with late spring and early summer being the peak period. Second, the seasonal variation was most pronounced the closer one got in the analysis to the true beginning of the disease. Third, variable and conflicting results were seen when later events (death) were studied. These results were

surprising to the authors, since we had expected to find a peak of clinical onset in the winter which might be related artifactually to the effects of seasonal respiratory infections calling attention to mild, early leukemia. Therefore, an attempt was made to further characterize and explain the summer peak.

The mean age (between 5 and 6 years) of the group of patients with clinical onset between May and August did not differ significantly from the entire group. The peak was seen from May to July with children less than 6 years of age; with children 6 or more years of age, June to August was the period of greatest incidence. The seasonal variation was seen with boys (51 patients), but especially with girls (40 patients). It was noted predominantly with white children (76 patients). The summer peak was noted for children residing in Baltimore city (39 patients) or in Maryland outside of Baltimore (24 patients), but not in those children who were referred from outside of Maryland. It was difficult to single out years in which the summer peak was most notable, but only 1951, 1954, 1957, 1958 and 1960 clearly showed the trend.

When cases were plotted by date of birth, no seasonal or temporal trends were seen. Fourteen cases were born in October (eight expected), but September and November births were fewer than expected, and the October births were distributed over ten different years.

There was no association between the summer peak, and the parents' age at the birth of the patient, or blood type. However, if those patients whose parents were 35 or more at the time of birth are disregarded, the seasonal pattern becomes exaggerated.

The clinical features of the onset of the leukemic illness in the summer was compared with those of the rest of the year (Table 2). According to the major manifestations leading to the recognition of the illness, there were no striking differences. It was true, however, that upper respiratory infections and adenopathy were more frequent during the winter. Patients presenting from May to August had a mean of 1.4 manifestations of the disease as presenting complaints; this figure was 1.6 for the rest of the year. Forty-eight cases were classified as acute lymphocytic leukemia and thirty-two as stem-cell leukemia. The summer peak was seen with both of these, but not with the remaining 11 monocytic or myelogenous leukemia patients.

The mean interval between the clinical onset and diagnosis for all cases was 2.3 months. The *mean* was 2.5 months in the summer, 2.0 for the rest of the year, 2.3 for whites, and 1.7 for Negroes. These differences are not statistically significant. In all of these groups, the *median* interval between onset and diagnosis was one month. The duration of the illness after diagnosis did not differ significantly according to season. The mean total duration of the illness with onset in summer was 7.1 months, and with onset in the winter 6.5 months (Table 3). The mean interval between diagnosis and death was 4.6 months in the summer, and 4.5 months in the winter. The mean initial hematocrit (28%) and total leukocyte count (28,000) did not differ significantly according to season of onset. These observations are summarized in Table 3 and suggest that the summer peak was not attributable to the influence of school schedules on the time of seeking medical care or to the stress of summer activities.

TABLE 2: Primary Factors in the Recognition of Acute Leukemia in Children

Manifestation	Frequency at Onset (% Patients)	
	May-August	September-April
Anemia and weakness	44	50
Infection	30	29
Bleeding	28	29
Pain (bone, muscle)	21	29
Fever	19	13
Adenopathy	2	11

The prevalence of cases under observation during the interval 1950 to 1962 ranged from 4.0 to 5.4 cases per month, with a mean of 4.7. No seasonal variation in prevalence was noted.

TABLE 3: Character of the Illness According to Season of Onset

Time of Onset	Interval in Months Mean and (Median)			Initial Hematocrit (Mean)	Initial Leukocyte Count (Mean)
	Onset to Diagnosis	Diagnosis to Death	Onset to Death		
May-August	2.5 (1)	4.6 (4.5)	7.1 (5.5)	29	28,000
Sept.-April	2.0 (1)	5.0 (4.5)	7.0 (5.5)	27	28,000

Discussion

These studies have demonstrated a seasonal variation in the onset of acute lymphocytic or stem-cell leukemia in children living in Maryland and presenting at The Johns Hopkins Hospital from 1950 to 1962. The phenomenon was especially notable in white girls, and in children whose parents were less than 35 years old. More cases seemed to begin in the late spring and early summer than can be accounted for on the basis of chance alone. They further suggest this variation is a true character of the disease not attributable to bias or artifacts in the selection presentation, or referral cases. That the observation is not an artifact related to the school schedule is suggested by the fact that it was observed in pre-schoolers, and by the fact that the illness did

not seem to be detected at different stages in the summer. The interval between clinical onset and diagnosis did not differ according to season. That the disease was not detected earlier or later in the course of the illness, because of the influence of climate or physical activity, was suggested by the data showing that the symptoms and laboratory findings at onset, and the total duration of the illness did not vary according to season. The phenomenon seems to be a true character of leukemia in this region.

When the reported studies on seasonal variations in the onset of leukemia in children are compared with ours, several observations are apparent. First, three of the nine studies are in agreement with ours. Second, those in disagreement are subject to certain statistical and methodological, as well as geographic criticisms. The early summer peak is in agreement with the data of Lec [7] and Knox,[8] and the young subgroup of undifferentiated cases reported by Fraumeni.[6] Lanzkowsky[5] and Hayes[4] found winter peaks. The cases in children under 12 reported by Scanu are suggestive of a summer peak, but he felt no trend could be seen.[10]

The significance of the seasonal variation is not clear. Certain speculations may be made concerning the implications of our results. First, there is no evidence they are related to radioactive exposure. The available evidence suggests that radioactivity is associated primarily with myelogenous leukemia and has a latent interval which is too long for a seasonal effect to be noticed.[1] While our data bear certain superficial resemblances to data on the seasonal onset of pellagra, the association of higher leukemia rates with a higher standard of living makes it unlikely that leukemia is a nutritional deficiency disease. Like pellagra, however, it may be that leukemia in some way is potentiated or accelerated by sunlight. We were unable to relate our data to any genetic factors (maternal age at birth, mongolism, blood type), but elimination of those patients whose parents were 35 years of age or older at the time of giving birth exaggerated the seasonal pattern. This is an important observation, and needs confirmation in larger studies. One of our patients had mongolism. A random sample seven times larger would ordinarily have been required for inclusion of one case of mongolism by chance alone.

One exception to the summer peak we noted involves those cases referred from south of Virginia. This tends to coincide with the data of Hayes [4] in which South Carolina patients under ten years of age were shown to have an increased incidence of *diagnosed* leukemia during February and March.

Another possible explanation for the seasonal pattern is that it is the result of seasonal variations in metabolic or hormonal activity. Blood cholesterol levels, thyroid and adrenal activity, and height- and weight-gain patterns are reported to show seasonal variation.[13] Thyroid and adrenal activity is increased during cold weather, and it may be that suppression of leukemia in its early stages occurs under these conditions, only to appear with the onset of warm weather and the decline in hormonal output. Brown showed that laboratory mice undergo seasonal variations in the growth of internal organs, including the thymus and lymphatic tissue.[14] Relative thymus weight was greatest from April to September in his mice. Susceptibility to experimental infection and tumorogenesis was highest in February and March, and lowest in June and July in his animals. We attempted to obtain evidence of seasonal variation in growth of internal organs in humans by reviewing the weights of internal organs in groups of children autopsied by the Medical Examiner in Baltimore because of accidental death. Our data were not sufficient to answer the question, however, and we have been unable to obtain evidence on this fundamental question elsewhere.

Lee has recently reported that neuroblastomas also appear in a seasonal pattern, with a summer peak similar to the one observed for leukemia.[15] If his observations are confirmed, it suggests either that numerous neoplasms are caused by infectious agents and have a similar latent period, or that the observed seasonal phenomenon represents a fundamental host process which influences the rate of tumor growth. Of the two hypotheses, the latter seems more plausible.

From the foregoing discussion, it is obvious that our data do not lend themselves solely to the conclusion that leukemia is a disease caused by an infectious agent. The most likely explanation for the seasonal variation is that it is related to infections, possibly in the winter, or to fundamental metabolic or hormonal influences upon tumor growth rates. Whatever the explanation, and there are undoubtedly others we have not considered, it would appear that the seasonal variation is a true character of childhood leukemia in Baltimore, and not an analytical artifact. As such, it is worthy of more intensive study, preferably in prospective studies, in carefully defined populations, in different regions and climates, and in different years. Such studies, if carefully controlled, may help to determine whether leukemogenesis is related to known, common infectious agents, or they may help define the epidemiology of still obscure, causative agents of leukemia. The possibility that metabolic hormonal, and even immunological factors are operative in humans to seasonally retard or accelerate the growth of malignant tissue is also obviously worthy of further study.

your medical faculty at work

by John Sargeant
Executive Secretary

The Executive Committee met on Thursday, October 9, 1969, and took the following actions:

1. Heard that the Internal Revenue Service has notified the Faculty its tax returns are in order;
2. Agreed to establish specific dates and to meet biennially with the Hospital Council Executive Committee to discuss mutual areas of concern—this is subject to Hospital Council approval;
3. Agreed to add the name of the Secretary of Health and Mental Hygiene to the mailing list of the Faculty's House of Delegates;
4. Endorsed a proposal from the U.S. Pharmacopeia for a commemorative stamp on the occasion of the 150th anniversary of this publication;
5. Endorsed the principles enumerated by the Consumer Credit Counseling Service, a nonprofit organization, on the basis that cooperation on the part of physicians is voluntary;
6. Agreed to cooperate with the Department of Health and Mental Hygiene in connection with an "in-depth" study of the physician manpower shortage;
7. Agreed to establish an Advisory Council on Human Trials that would advise the Secretary of Health and Mental Hygiene in connection with human trial projects;
8. Discussed, at considerable length, specific cases of alleged professional liability, authorized legal defense and employment of additional legal counsel in certain cases; and requested the President to call a special meeting of the Faculty's House of Delegates to consider bylaw changes in this connection and discuss the general problem of malpractice actions in Maryland;
9. Authorized designation of a representative to attend an all-day session dealing with the future role of the U.S. Pharmacopeia;
10. Authorized the Faculty's auxiliary to receive credit for collection of AMA-ERF funds through the Faculty;
11. Renamed several physicians to the Medical Advisory Board of the Red Cross Blood Program;
12. Endorsed a project request for Tuberculosis control as requested by the Baltimore City Health Department;
13. Authorized appointment of a special group of physicians to serve on a continuing committee to involve Peer Review;
14. Endorsed a request that a nonprofit group be established for the operation of the Preschool Hearing and Vision Screening Survey with the Faculty to name four members of the seven member board; and the Maryland Society for Prevention of Blindness to name the remaining three members. The Executive Committee also made the sum of $5,000 available for this group to initiate the project and get the program underway.

ETHICS CORNER

In regard to the recent proliferation of charge cards, particularly as they apply to the medical field, it is important that physicians fully understand the ethics involved in the acceptance and use of such charge cards in their practice.

As early as 1963, the Medical and Chirurgical Faculty frowned upon the use of charge cards that lumped medical bills with other services or items purchased by an individual. The Faculty stressed the importance of keeping such charges completely separate from medical fees; and the need to ensure that the fee charged the patient was not increased by the use of such charge services. The Faculty has, in some instances, ruled that the use of specific charge cards or services is unethical. In other instances, it has found that the use of such services is ethical. Each case is decided on the individual arrangement between the patient, the physician, and the charge service. In the latest issue of AMA's Judicial Council opinions, which the Faculty's Bylaws require physicians to abide by, the following summary is provided:

In connection with physician participation in bank card programs, the Judicial Council recommends the following principles to be implemented and applied as necessary by the county medical society for the guidance of physicians as these programs develop.

(1) The county medical society should be satisfied as to the financial and professional integrity of the plan. It should negotiate with the plan sponsors to insure that service charges to the physician are reasonable. It should insist that the plan be open to all physicians on the same terms and that it not exploit or capitalize on physicians' participation in the plan. It should advise the plan that the listing of physicians in directories of participating members is contrary to the ethics of the medical profession.

(2) The individual physician may not, because of his participation, increase his fee for medical service rendered the patient. He may not use the plan to solicit patients. He may not encourage patients to use the plan. His position must be that he accepts the plan as a convenience to patients who desire to use it. Plaques or other devices indicating participation in the plan within the physician's office shall be kept to a discreet and dignified minimum. Plaques, signs, or other devices indicating such participation visible outside the physician's office are unacceptable.

(3) The use of a bank card in connection with the payment of larger fees—which might normally be paid to the physician in installments—is not to be encouraged. All members of the Association are expected to continue the traditional practice of permitting patients of limited means to pay relatively large fees in installments without interest or carrying charges. Out of respect for the dignity and traditions of the medical profession, the physician may not relieve himself of his obligations "to render service to humanity, reward or financial gain being a subordinate consideration."

For elderly patients in need of a mild tranquilizer consider **Tybatran**®

brand of tybamate

(When you consult the Prescribing Information you may agree it makes good sense)

PRESCRIBING INFORMATION

Indications: Tybatran (tybamate) has afforded symptomatic improvement in a variety of psychoneurotic disorders, especially in the treatment of the anxiety and tension components of psychoneuroses. Anxiety states manifested somatically have responded to Tybatran (tybamate).

Tybatran (tybamate) has been useful in the control of agitation in the aged and in the alleviation of some of the adverse emotional accompaniments of senility.

Tybatran (tybamate) has been used with benefit in the treatment of depressive symptoms associated with anxiety and other symptoms of psychoneuroses. However, it is not indicated for primary treatment of depressive states. It is not an antipsychotic agent, although it has been used as adjunctive therapy in some psychotic patients.

Dosage: One 350 mg. capsule, 3 times daily and two at bedtime is suggested as the adult starting dose. Adjust to suit individual requirements. Daily doses above 3000 mg. are not recommended.

Contraindications: Known hypersensitivity to tybamate. Since no studies have been done with this drug in human pregnancy, it should not be used in pregnancy unless the potential benefit outweighs the risk.

Warnings: Administer cautiously to patients receiving phenothiazines or other CNS depressants or having history of convulsive seizures (See Adverse Reactions). Consider possibility of additive actions with alcohol or other psychotropic agents, particularly phenothiazines or MAO inhibitors.

Precautions: Avoid abrupt withdrawal after prolonged use, although withdrawal symptoms have not been reported to date. Exercise caution in addiction-prone individuals. If symptoms of hypersensitivity occur, discontinue at once and initiate appropriate symptomatic treatment. Avoid activities requiring optimal mental alertness if drowsiness or vertigo are present. As with any new drug, use cautiously in patients with history of drug allergies, blood dyscrasias, and hepatic or renal disease; periodic measurements of hepatic, hematopoietic and renal function should accompany prolonged and/or high doses.

Adverse Reactions: Most frequent reactions, rarely requiring discontinuation of tybamate, include drowsiness, dizziness, nausea, insomnia, and euphoria. There have been a few reports of skin rash, urticaria, and pruritus. Rare side effects include hyperactivity, fidgetiness, flushing, and tachycardia, suggesting excessive stimulation; also ataxia, unsteadiness, confusion, feeling of unreality, "panic reaction," fatigue, headache, paresthesias, vertigo, gastrointestinal disturbances, glossitis, and dry mouth. Grand mal or petit mal seizures have been reported in a few hospitalized psychotic patients receiving tybamate (up to 6000 mg. daily) together with phenothiazines and other psychotropic agents, but not with tybamate alone. Consider the possibility of rare, serious adverse reactions such as may occur with the related drug, meprobamate. If excessive amounts are ingested, gastric lavage and symptomatic therapy, including central stimulants as necessary, are recommended. Before prescribing, consult package circular.

Supply: Tybatran (tybamate) is available in green, sealed capsules of three strengths: 350 mg., 250 mg., and 125 mg. Each strength is supplied in bottles of 100 and 500.

Roniacol® Timespan®

(nicotinyl alcohol tartrate)

Because peripheral vasodilation is needed now... and must often be continued

Roniacol Timespan (nicotinyl alcohol tartrate) can make a significant contribution to effective treatment of peripheral vascular disorders. It is directed specifically toward improvement of peripheral blood flow, relief of ischemic symptoms, and the long-term management of these conditions.

Specific pharmacologic action—Roniacol (nicotinyl alcohol) acts selectively by relaxing smooth muscle of peripheral blood vessels. Onset of action is smooth and gradual, rarely causing severe flushing.

Relative freedom from side effects—Side effects that may occur occasionally with Roniacol seldom require discontinuation of therapy.

Prolonged, continuous drug release—Prolonged peripheral vasodilation is provided sustained-release Roniacol Timespan (nicotinyl alcohol tartrate) Tablets. Part of the drug becomes available immediately, the remainder continuously over a period of up to 12 hours and dilation of constricted peripheral vessels usually maintained. Thus, with a single dose of medication, patients can enjoy the benefits of increased peripheral blood flow in ischemic extremities for up to 12 hours.

Smooth peripheral vasodilation from initial dosage...extended with simple, well-tolerated, b.i.d. dosage

...ne prolonged action of Roniacol Timespan ...nicotinyl alcohol tartrate) together with its ...the benefits offer a therapeutically practical ...ea re in the long-term management of ...eripheral vascular disease–advantages ...pecially important for older patients.

...efo prescribing, please consult complete ...odct information, a summary of which ...llows:

...dications: Conditions associated with ...efficient circulation; *e.g.*, peripheral vascular ...sease, vascular spasm, varicose ulcers, ...ecutal ulcers, chilblains, Meniere's syn...om and vertigo.

Caution: Roche Laboratories endorses caution in the administration of any therapeutic agent to pregnant patients.

Side Effects: Transient flushing, gastric disturbances, minor skin rashes and allergies may occur in some patients, seldom requiring discontinuation of the drug.

Dosage: 1 or 2 Timespan Tablets—150 mg nicotinyl alcohol in the form of the tartrate salt—bottles of 50 and 500.

Food 'n mouth disease

reludin® phenmetrazine hydrochloride
reludin is indicated only as an anorexigenic agent in the treatment of obesity. It may be used in simple obesity and in obesity complicated by diabetes, moderate hypertension (see Precautions), or pregnancy (see Warning).

ontraindications: Severe coronary artery disease, hyperthyroidism, severe hypertension, nervous instability, and agitated prepsychotic states. Do not use with other CNS stimulants, including MAO inhibitors.

arning: Do not use during the first trimester of pregnancy unless potential benefits outweigh possible risks. There have been clinical reports of congenital malformation, but causal relationship has not been proved. Animal teratogenic studies have been inconclusive.

Precautions: Use with caution in moderate hypertension and cardiac decompensation. Cases involving abuse of or dependence on phenmetrazine hydrochloride have been reported. In general, these cases were characterized by excessive consumption of the drug for its central stimulant effect, and have resulted in a psychotic illness manifested by restlessness, mood or behavior changes, hallucinations or delusions. Do not exceed recommended dosage.

Adverse Reactions: Dryness or unpleasant taste in the mouth, urticaria, overstimulation, insomnia, urinary frequency or nocturia, dizziness, nausea, or headache.

Dosage: One 25 mg. tablet b.i.d. or t.i.d. Or one 75 mg. Endurets tablet a day, taken by midmorning.

Availability: Pink, square, scored tablets of 25 mg. for b.i.d. or t.i.d. administration, in bottles of 100 and 1000.
Pink, round Endurets® prolonged-action tablets of 75 mg. for once-a-day administration, in bottles of 100 and 1000.
(B)R3-46-560-B

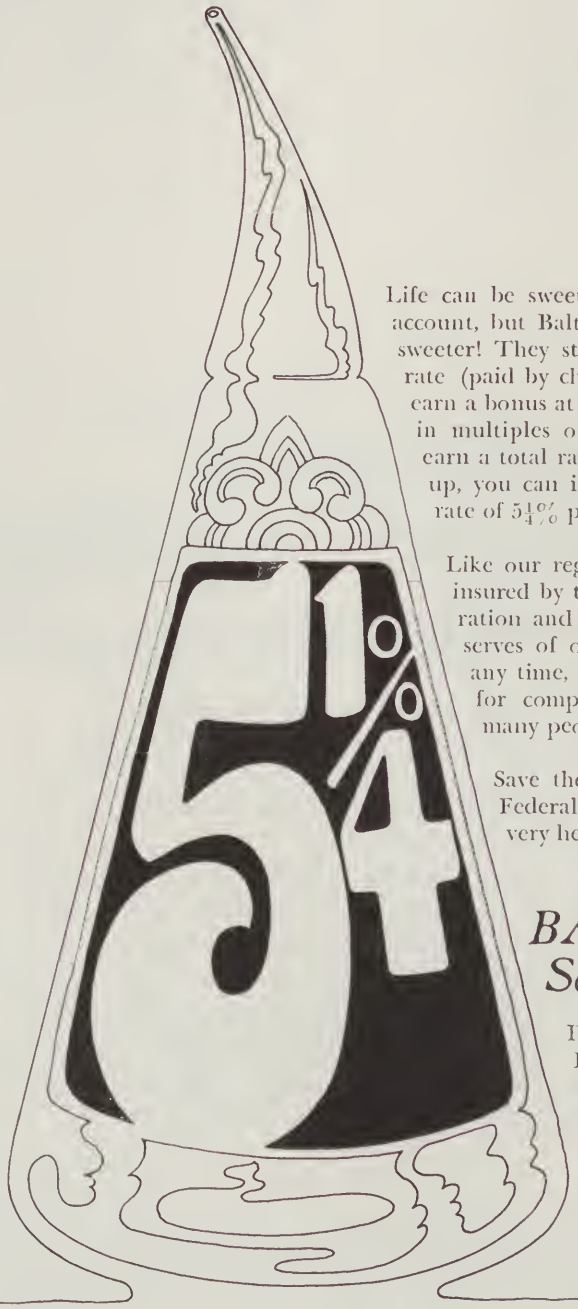
Under license from Boehringer Ingelheim G.m.b.H.

For complete details, please see full prescribing information.

Geigy Pharmaceuticals
Division of Geigy Chemical Corporation
Ardsley, New York 10502

For some, obesity can be a serious complication of moderate hypertension, diabetes, or pregnancy.

Preludin may be used to curb appetite in obesity associated with such conditions.



For use during pregnancy, please consult Warning paragraph. The use of Preludin in moderate hypertension should be accompanied by caution. In diabetes, the drug does not increase insulin requirements (requirements may be reduced as weight is lost).

One 75-mg. Endurets tablet taken between breakfast and midmorning will usually provide daylong and early-evening suppression of appetite.

Preludin® phenmetrazine hydrochloride **Endurets®** prolonged–action tablets

THE SWEETENER

Life can be sweet when you have a Baltimore Federal savings account, but Baltimore Federal Savings Certificates can be even sweeter! They start by earning interest at our current interest rate (paid by check at regular quarterly interest periods), then earn a bonus at maturity. You can invest from $1,000 to $11,000 in multiples of $1,000 for either six months or a year and earn a total rate of 5% per annum guaranteed! From $12,000 up, you can invest for either period and earn a guaranteed rate of 5¼% per annum.

Like our regular passbook savings account, your money is insured by the Federal Savings and Loan Insurance Corporation and further backed by Baltimore Federal's own reserves of over $25,000,000. Certificates may be cashed at any time, earning interest at our regular rates. Of course, for complete flexibility combined with high interest, many people still prefer our passbook accounts.

Save the way it suits you best . . . any of Baltimore Federal's five plans sweetens your savings with some very heavy sugar.

*Maryland falls in this area.

Since Maryland is located in the Middle Atlantic region, ranking sixth in the number of hospitals in the country, the need for an increased hospital library staff and expanded facilities in our region becomes evident.

Because of federal libraries and other medical and paramedical institutions found in the region, Maryland fortunately possesses resource facilities not available to many other areas. The great disadvantage of our proximity to Bethesda, however, is the lack of a regional medical library for this area. Smaller libraries are hampered by not having a central intermediary source specifically designed to handle interlibrary loans, and the National Library of Medicine is reluctant to process requests for material available in the state.

Lost Book

One book must have wandered away from the library exhibit taken to Hershey for the semiannual meeting. If, by any chance, the following title shows up on your shelves, please return it to the Med/Chi Library:

Cardiac diagnosis, by Noble O. Fowler. 1968

Regional Medical Library Association Meeting

The MLA regional meeting will be held on Saturday, November 22, at NIH in Bethesda. Notices will be forthcoming. If you have any news of Maryland medical libraries, please send a notice to Elizabeth Sanford, Librarian, Medical and Chirurgical Faculty of Maryland, 1211 Cathedral St., Baltimore, Maryland 21201.

Want Any Old Books?

Again, a collection of duplicate copies of books being withdrawn from the library holdings is offered to any member of the Faculty who is interested in scanning the titles and selecting items he might want to add to his own library.

We ask that any physician choosing to take books from this collection, please refrain from selling them to book stores or dealers.

ROBERT E. FARBER, MD, MPH, COMMISSIONER

Baltimore City health department

New Appointments

Dr. Carr—Local Health Services

James D. Carr, MD, has been appointed Assistant Commissioner of Health for local health services in the Baltimore City Health Department, effective August 18. Formerly Director of Medical Education at Provident Hospital, Dr. Carr will administer the activities of the city's health districts, coordinating, evaluating, and programming the preventive and treatment services available to residents on a neighborhood basis.

As a native Baltimorean and a lifetime resident of the city, Dr. Carr has been associated with the City Health Department since 1941 as a part-time clinic physician in the division of venereal diseases, and more recently as a school physician examining children and directing their treatment and care.

Dr. Carr attended the public schools of Baltimore and graduated from Douglass High School. He received his BS degree from Morgan State College in 1929 and the MD degree from Howard University Medical School in 1935. Following internship and residency at Provident Hospital, Dr. Carr entered private practice and assumed part-time medical and administrative duties at the hospital. In 1964, he was named Provident's Chief of Staff, and in 1966 became Director of Medical Education.

Dr. Carr is a member of the Monumental Medical Association, the Medical and Chirurgical Faculty of Maryland, the National Medical Association, the American Heart Association, the American Association for Continuing Hospital Medical Education, the Omega Psi Phi Fraternity, and the American Association of Health, Physical Education and Recreation.

Dr. Berzon—Veterinarian

David R. Berzon, DVM, has been appointed Public Health Veterinarian, a new post in the Baltimore City Health Department. Formerly Director of the Bureau of Meat Inspection, Dr. Berzon will supervise the enforcement of municipal ordinances and regulations governing animal diseases transmissible to man, as well as those laws dealing with the humane treatment of animals. In addition, he will serve as a consultant in the investigation of illnesses suspected to be of animal origin, and will maintain a close liaison with state and federal veterinary regulatory agencies and organizations.

Dr. Berzon has been with the Baltimore City Health Department since 1961, and has been Director of the Bureau of Meat Inspection since 1965. On July 1, the work of this bureau was integrated with the State Board of Agriculture through the enactment of the Maryland Wholesome Meat Act, whereby staff members were transferred to other posts in the department or to the Meat Inspection Service of the State Board of Agriculture.

In 1966, Dr. Berzon was coordinator of the Baltimore Anti-Rabies Campaign, and was highly instrumental in the success of this program in which over 6,000 dogs were protected with anti-rabies vaccine in a two-day period.

Dr. Berzon received his DVM degree from the University of Georgia in 1954 and the Master of Public Health degree from The Johns Hopkins School of Hygiene and Public Health in 1968. He has been in private practice, and for three years was a veterinarian with the United States Department of Agriculture. During the Korean emergency, he served as officer-in-charge of preventive medicine programs at four United States Air Force bases overseas. Dr. Berzon attended the St. Louis University School of Law. He is a member of the American and Maryland State Veterinary Medical Associations.

Survival of Acute Respiratory Failure

A study was made of 239 episodes of acute respiratory failure in 146 patients with chronic respiratory insufficiency. Twenty percent of the patients survived at least 30 months. Survival rates were lowest for patients with diffuse infiltrative disease.

A study was undertaken to determine the survival time of chronic lung disease patients after an episode of acute respiratory failure, and to ascertain whether clinical and physiological findings correlated with survival.

Accordingly, 146 men treated at the Veterans Administration Hospital, Durham, N.C., for 239 episodes of acute respiratory failure were studied prospectively over a four-year period.

Each patient was classified as belonging to one of six groups on the basis of clinical and roentgenographic characteristics of his disease. The groups and the number of patients and episodes, respectively, in each category were: I, Chronic diffuse infiltrative disease—13, 22; II, Hyperinflated lungs (emphysema) without hypercapnia—33, 43; III, Hyperinflated lungs with hypercapnia—36, 44; IV, Hyperinflated lungs with hypercapnia and bronchitis—31, 63; V, Chronic bronchitis with hypercapnia but without hyperinflated lungs—20, 33; and VI, obese bronchitis—13, 34.

Calculations were made of vital capacity, forced vital capacity (FVC), forced expiratory volume in 0.5 and in 1.0 second ($FEV_{0.5}$ and FEV_1), maximal inspiratory flow rate (MIFR), maximal expiratory flow rate (MEFR), and maximal midexpiratory flow rate (MMEF).

Measurements were made of arterial blood carbon dioxide and oxygen tensions and pH within ten minutes of obtaining samples, which often was at the time the patient arrived at the hospital.

Respirator Assistance

Pressure-cycled respirators were used to control ventilation in 64 episodes, to assist ventilation in 54, and intermittently to assist it in all other episodes. Patients requiring controlled ventilation had more severe respiratory failure than the others. However, no general conclusions on survival prognosis of the individual patient should be drawn from this. For a few patients with severe bronchitis, the high pressures of a volume-cycled respirator were needed to maintain adequate ventilation.

The 100 patients in groups II, III, and IV had X-ray evidence of emphysema. One third of these had P_aco_2 below 50 mm Hg while the others had sustained P_aco_2 elevations during respiratory failure.

In age, the patients ranged from 35 to 88 years, with a mean of 61. Mean ages at onset of acute respiratory failure were highest (63 and 64 years, respectively) in groups II and III (emphysema without clinical chronic bronchitis).

Pulmonary emphysema patients without clinical bronchitis (groups II and III) had a mean weight of 120 lb in contrast to a mean of 169 lb in those with chronic bronchitis without emphysema (group V). The mean weight of patients with emphysema

Tryggvi Asmundsson, MD, and Kaye H. Kilburn, MD, *Annals of Internal Medicine,* March, 1969.

and bronchitis (group IV) was midway between that of groups II and III and of group V. The obese patients (group VI) had a mean weight of 277 lb.

The obese patients had been dyspneic for only 4.5 years before the onset of respiratory failure. Patients in all other groups had been dyspneic for a period of 9.8 to 12.8 years. There was no clear relationship between dyspnea and objective evidence of ventilatory insufficiency.

Although vital capacity was reduced in all patients, the greatest reduction was in those with pulmonary emphysema and hypercapnia. The obese patients had the greatest number of recurrent episodes.

Of 146 patients, 135 smoked cigarettes. Most had smoked 20 or more cigarettes a day for 20 years. Two patients had smoked a pipe. Only nine had never smoked.

Survival Rates

Patients survived 162 (68%) of the 239 episodes. Eighty-seven survived the initial episode and 81 of these were alive six months later. After two and a half years, the survival rate had fallen to about 20% and remained constant for patients followed for four years. This was in contrast to the expected four-year survival rate of 89% for unselected men of 61 years of age in this country, an indication of the excessive mortality of patients in acute respiratory failure.

Only 15% of the patients with diffuse infiltrative disease survived six months or longer, compared with 30% of those with emphysema without hypercapnia; 39% of those with emphysema and hypercapnia; 23% of those with chronic bronchitis and emphysema; 55% of those with chronic bronchitis; and 69% of the obese-bronchitic group.

Three of the 13 patients with diffuse chronic infiltrative disease had a short, fatal course and had the Hamman-Rich syndrome. The other ten had a more protracted illness. Survival of the group was uniformly poor after onset of acute respiratory failure.

All patients with pulmonary emphysema had a serious prognosis. The chronic bronchitis patients without emphysema had a significantly better chance of survival than those without significant hypercapnia. The chronic bronchitis patients without emphysema had a significantly better survival than the three groups of patients with emphysema. This would be expected because exacerbations of bronchitis are potentially reversible, but the destruction of alveoli in emphysema is permanent.

Several factors may have influenced survival of the obese patients. Their average age was ten years less than the average age of patients in other groups and pulmonary function impairment was less severe than among the other groups. Obese patients who did not regain lost weight had no recurrence of respiratory failure.

Preservation of airflow and vital capacity correlated with survival and, conversely, airway obstruction as measured by decreased MMEF rates correlated with poor long-term survival. Severe impairment of gas exchange suggested a poor prognosis after an episode of respiratory failure.

Anemia and, to a lesser degree, edema, were also predictive of poor survival. Loss of hemoglobin reduces the oxygen-carrying capacity of the blood and low arterial oxygen tension is therefore less well tolerated. Edematous patients had a shorter survival after the initial episode than the nonedematous patients, but the difference was not statistically significant.

Patients who survived for 30 months appeared to have a death rate comparable to that of the normal male population of the same age. In this study no factor was identified as common to patients with long survival. Therefore, each patient must be treated as if he were among the 20% who will survive 30 months.

One of these disposables comes prefilled.
Its unit dose – in nonreactive glass
cartridge – is premeasured.
The cartridge is clearly labeled:
drug name, strength, control number.
Even expiration date where appropriate.

You're more confident that the patient gets...

. . . just what the doctor ordered with the Tubex Closed Injection System.

Injections with the Tubex system are as easy as 1, 2, 3,

1. Select—from an extensive variety of prefilled Tubex sterile cartridge-needle units.* No multi-dose vials to bother with; no unlabeled syringes to cause confusion.

2. Inject—with a minimum of pain. Thanks to the single-use, stainless-steel needle that's both ultra-sharpened and siliconized. Aspirate simply and conveniently.

3. Throw away—empty cartridge-needle unit. Never used again, it can't transmit infection. And there's no clean-up job.

*For injectables not yet in the ever-expanding prefilled Tubex line, empty sterile cartridge-needle units are available.

WILLIAM J. PEEPLES, MD, MPH, COMMISSIONER

Maryland State department of health

Medical Assistance Advisory Committee

Neil Solomon, MD, Secretary of Health and Mental Hygiene, recently announced the appointment of 24 members to the newly constituted Medical Assistance Advisory Committee.

The Committee, required by Federal Legislation, will advise the Secretary on broad policy matters relating to the administration of the state's Medicaid program.

Dr. Solomon said that Medicaid has been budgeted with over $74 million for fiscal 1970 which probably represents the largest investment by the State of Maryland in the health of its citizens.

He noted that the members of the Committee were selected from a wide variety of health professions including medicine, pharmacy, dentistry, nursing, hospitals, and public health services.

Named Chairman of the Medical Assistance Advisory Committee was Louis L. Randall, MD, President of the Monumental City Medical Society. Others appointed were: William L. Stewart, MD, President, Maryland Academy of General Practice; Howard E. Hall, MD, of Sykesville, Md.; Robert W. Gibson, MD, Medical Director, the Sheppard-Enoch Pratt Hospital; Emerson C. Walden, MD, John T. Chissell, MD, Raymond L. Gray, DDS, Mr. Bernard B. Lachman of Baltimore; Richard Hollander, MD, of Silver Spring, and Mr. Denwood Kelly, President, Blue Shield.

Hospital officials appointed to the Committee were: Reginald H. Dabney, President, Maryland Hospital Services; Harry W. Penn, Jr., Administrator, Prince George's General Hospital; J. Emmett Queen, MD, Director of Medical Education, Bon Secours Hospital; and Henry J. Whyte, Administrator, Provident Hospital.

Government and public health officials named were: William J. Peeples, MD, Commissioner, State Health Department; Robert E. Farber, MD, Commissioner, Baltimore City Health Department; Raleigh C. Hobson, Director, State Department of Social Services; Maurice A. Harmon, Director, Baltimore City Department of Social Services; Alice B. Tobler, MD, Director of Mental Health Planning, State Department of Mental Hygiene; and Benjamin D. White, MD, Director, Bureau of Preventive Medicine, State Health Department.

Also appointed were: Walter Granruth, MD, Baltimore County; William J. Kinnard, Jr., MD, Dean of the School of Pharmacy, University of Maryland; James P. Cragg, Jr., Baltimore; Miss Patricia Lusk, Prince George's County Health Department; Mrs. Vivian Pendleton, Baltimore City Health Department; Roger C. Lipitz, and Mrs. Elsie E. Bumbry.

The Apprehensive Hypertensive

Regroton® to lower blood pressure

chlorthalidone 50 mg.
reserpine U.S.P. 0.25 mg.

Regroton®: chlorthalidone 50 mg., reserpine U.S.P. 0.25 mg.
Indications: Hypertension. *Contraindications:* History of mental depression, hypersensitivity, and most cases of severe renal or hepatic diseases. *Warning:* With the administration of enteric-coated potassium supplements, which should be used only when adequate dietary supplementation is not practical, the possibility of small-bowel lesions (obstruction, hemorrhage, and perforation) should be kept in mind. Surgery for these lesions has frequently been required and deaths have occurred. Discontinue coated potassium-containing formulations immediately if abdominal pain, distention, nausea, vomiting, or gastrointestinal bleeding occur. Discontinue one week before electroshock therapy, and if depression or peptic ulcer occurs. *Use in pregnancy:* Because chlorthalidone may cross the placental barrier and appear in cord blood and thiazides may appear in breast milk, this drug should be used with care in pregnant patients and nursing mothers. When used in women of childbearing age, the potential benefits of the drug should be weighed against the possible hazards to the fetus. Use of chlorthalidone may result in fetal or neonatal jaundice, thrombocytopenia, and possibly other adverse reactions which have occurred in the adult. Increase respiratory secretions, nasal congestion, cyanosis and anorexia m occur in infants born to reserpine-treated mothers. *Precautions:* Antih pertensive therapy with this drug should always be initiated cautious in postsympathectomy patients and in patients receiving ganglion blocking agents, other potent antihypertensive drugs, or curare. Reduc dosage of concomitant antihypertensive agents by at least one-half. T avoid hypotension during surgery, discontinue therapy with this age two weeks prior to elective surgical procedures. In emergency surger use, if needed, anticholinergic or adrenergic drugs or other supporti measures as indicated. Because of the possibility of progression renal damage, periodic kidney function tests are indicated. Discontinu if the BUN rises or liver dysfunction is aggravated. Hepatic coma ma be precipitated. Electrolyte imbalance, sodium and/or potassium de pletion may occur. If potassium depletion should occur during therap the drug should be discontinued and potassium supplements given provided the patient does not have marked oliguria. Take particular care in cirrhosis or severe ischemic heart disease and in patients receiving

and allay anxiety in hypertension

orticosteroids, ACTH, or digitalis. Severe salt restriction is not recom-ended. Use cautiously in patients with ulcerative colitis or gallstones iliary colic may be precipitated). Bronchial asthma may occur in usceptible patients. *Adverse Reactions:* The drug is generally well lerated. The most frequent side effects are nausea, gastric irritation, miting, diarrhea, constipation, muscle cramps, headache, dizziness d acute gout. Other potential side effects include angina pectoris, xiety, depression, bradycardia and ectopic cardiac rhythms (espe-ally when used with digitalis), drowsiness, dull sensorium, hypergly-emia and glycosuria, hyperuricemia, lassitude, restlessness, transient yopia, impotence or dysuria, orthostatic hypotension which may be otentiated when chlorthalidone is combined with alcohol, barbiturates narcotics, leukopenia, aplastic anemia, skin rashes, thrombocyto-enia, agranulocytosis, nasal stuffiness, increased gastric secretions, ghtmare, purpura, urticaria, ecchymosis, weakness, uveitis, optic rophy and glaucoma, and pruritus. Eruptions and/or flushing of the in, a reversible paralysis agitans-like syndrome, blurred vision, con-nctival injection, increased susceptibility to colds, dyspnea, weight gain, decreased libido, dryness of the mouth, deafness, anorexia, and pancreatitis when epigastric pain or unexplained G.I. symptoms de-velop after prolonged administration. Jaundice, xanthopsia, paresthesia, photosensitization and necrotizing angiitis are possible. *Average Dosage:* One tablet daily with breakfast. *Availability:* Pink, single-scored tablets in bottles of 100 and 1000. (B)46-600-C

For details, please see complete prescribing information.

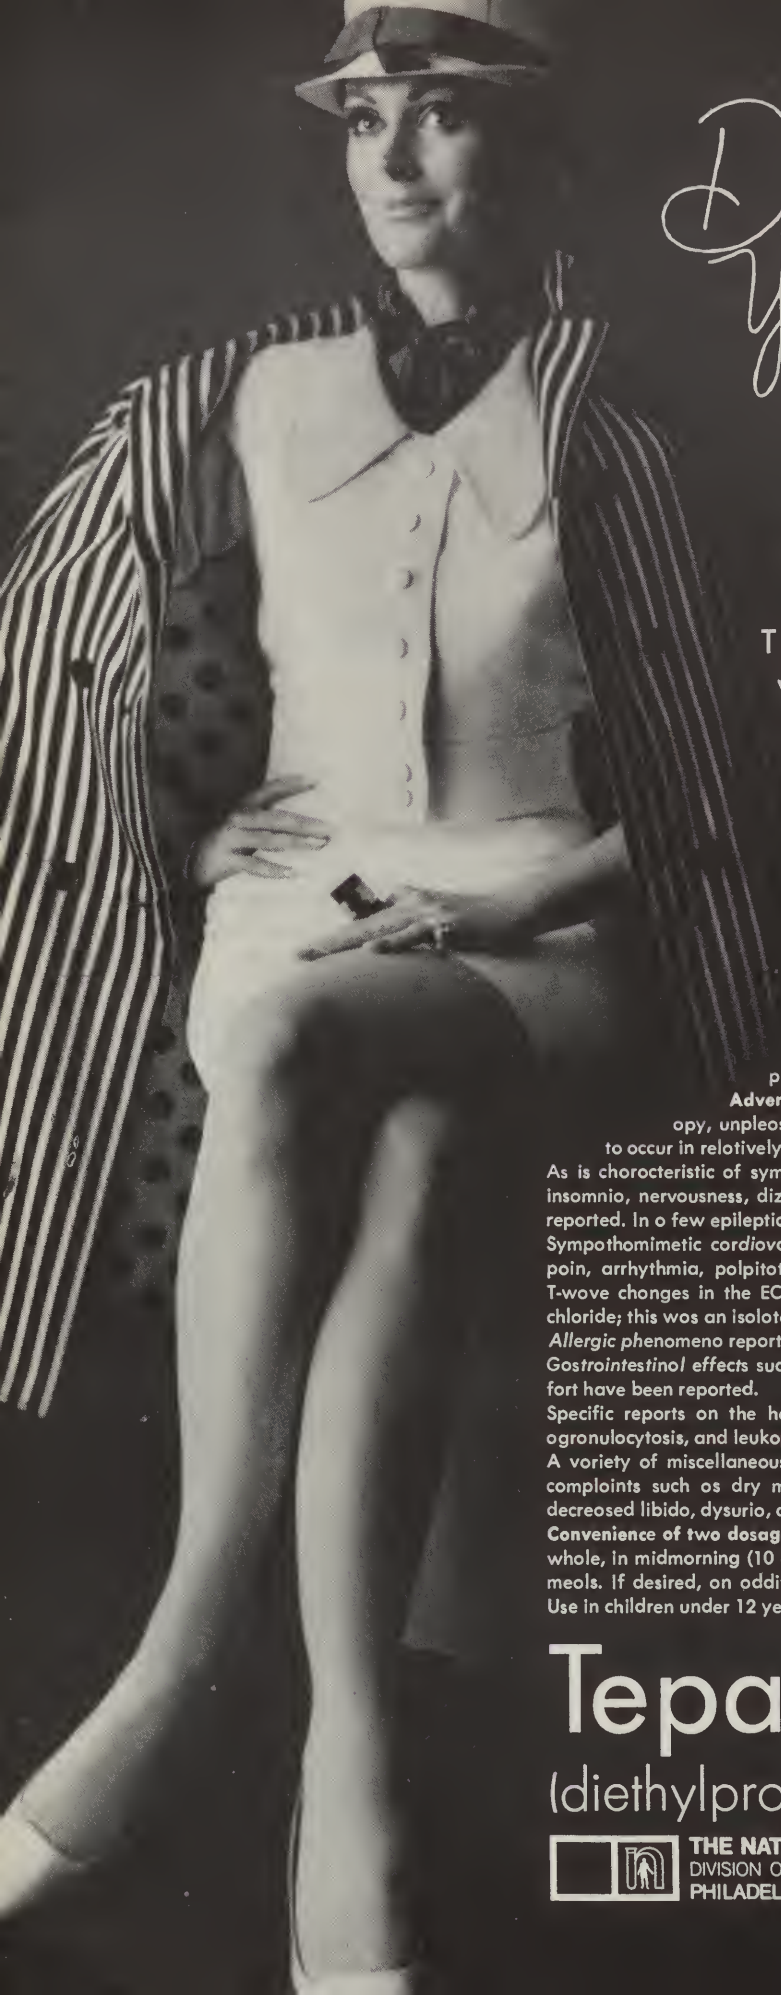
JAMES E. CARSON, MD, COMMISSIONER
KURT GORWITZ, ScD, STATISTICS DIRECTOR

Maryland State department of mental hygiene

Capacity, Patient Population Size and Occupancy Rates



Maryland's mental hospitals last year operated at an average 104.9% capacity, while institutions for the retarded were at a 116.9% level. Comparable data based on each hospital's highest daily patient figure during the year indicate an effective overcrowding of 10.7% and 20.1%, respectively, for the two types of facilities. Statistics for the year ending June 30, 1969, are summarized in the following table.

	TOTAL	PSYCHIATRIC HOSPITALS	INSTITUTIONS FOR RETARDED
AVERAGE PATIENT POPULATION	10,541	7,451	3,090
MAXIMUM PATIENT POPULATION	11,038	7,863	3,175
CAPACITY *	9,745	7,102	2,643
OCCUPANCY RATE			
BASED ON AVERAGE POPULATION	108.2	104.9	116.9
BASED ON MAXIMUM POPULATION	113.3	110.7	120.1

** Based on American Psychiatric Association recommended 80 square feet per bed in single rooms and 70 square feet per bed in dormitory areas.*

Occupancy rates varied between hospitals and within units of the same facility. While Springfield, the state's largest hospital, continued to be most overcrowded (18.3%), virtually all operated in excess of available capacity. Only the Eastern Shore hospital at Cambridge, where the number of patients has decreased by more than one-third, had an occupancy rate of less than 90%. Maryland's psychiatric hospitals have experienced a gradual reduction in occupancy rates averaging one percent per year, primarily resulting from a decreasing patient population. However, comparable data for the two institutions for the retarded have remained virtually unchanged in recent years since new construction has barely kept pace with the increasing number of patients.

Nearly 20 years have elapsed since a series of newspaper articles on "Maryland's Shame" produced a commitment to extensive, continuing remedial actions. The current existence of substantial overcrowding, often in open wards of old and nonfunctional buildings, despite large scale construction and a decline of more than 20% in the average number of patients, should be a matter of grave concern to all state residents. It should be recognized that this chronic situation is neither conducive to effective patient treatment nor to employee morale. The Department of Health and Mental Hygiene, in order to resolve this problem and meet treatment needs most effectively, is developing a program based on the establishment and expansion of a coordinated network of community based facilities and services providing appropriate alternatives to hospitalization.

Dear Doctor, You made me what I am today— a whole lot slimmer!

TEPANIL—the right start in support of t weight-control program *you* recommend. reduces the appetite. Doesn't kill it. Weig loss is significant—gradual—yet there is relatively low incidence of CNS stimul tion. Because TEPANIL works on t appetite, not on the "nerves."

Contraindications: Concurrently with MAO inhibitors, in patie hypersensitive to this drug; in emotionolly unstoble patie susceptible to drug obuse.

Warning: Although generolly sofer than the omphetomin use with greot coution in potients with severe hypertension severe cardiovosculor diseose. Do not use during first trimester pregnoncy unless potentiol benefits outweigh potentiol risks.

Adverse Reactions: Rorely severe enough to require discontinuotion of th opy, unpleosont symptoms with diethylpropion hydrochloride hove been repor to occur in relotively low incidence.

As is chorocteristic of sympothomimetic ogents, it moy occosionolly couse *CNS effects* such insomnio, nervousness, dizziness, onxiety, ond jitteriness. In contrast, CNS depression hos b reported. In o few epileptics on increose in convulsive episodes hos been reported.

Sympothomimetic *cordiovosculor effects* reported include ones such os tochycordio, precor poin, arrhythmia, polpitotion, ond increased blood pressure. One published report descril T-wove chonges in the ECG of o healthy young mole after ingestion of diethylpropion hyc chloride; this wos an isoloted experience, which hos not been reported by others.

Allergic phenomeno reported include such conditions as rosh, urticorio, ecchymosis, ond erythen *Gostrointestinol effects* such os diarrhea, constipotion, nauseo, vomiting, ond obdominal disc fort have been reported.

Specific reports on the hemotopoietic system include two eoch of bone morrow depressi ogronulocytosis, and leukopenio.

A voriety of miscellaneous odverse reoctions hove been reported by physicions. These inclu complaints such os dry mouth, heodoche, dyspnea, menstrual upset, hoir loss, muscle po decreosed libido, dysurio, and polyuria.

Convenience of two dosage forms: TEPANIL Ten-tob tablets: One 75 mg. toblet doily, swallow whole, in midmorning (10 a.m.); TEPANIL: One 25 mg. tablet three times doily, one hour bef meols. If desired, on odditionol toblet moy be given in midevening to overcome night hung Use in children under 12 years of oge is not recommended.

Tepanil® Ten-tab®

MRS. FRANK A. FARAINO, EDITOR

woman's auxiliary

Panel on "Drug Abuse" and Surprise Auxiliary Talent Highlight Semiannual Meeting

Mrs. Wallace H. Sadowsky, president, convened the semiannual meeting of the Woman's Auxiliary to the Medical and Chirurgical Faculty of the State of Maryland on September 5, 1969, in the lovely surroundings of the Hotel Hershey in Chocolate Town, USA. A silent prayer and the reading of the state auxiliary pledge set the mood for the meeting.

Greetings were extended to the ladies by John F. Schaefer, MD, Chairman of the Council of the Medical and Chirurgical Faculty of the State of Maryland. A roll call of officers, board members, and delegates followed. The minutes of the annual meeting, having been read by a reading committee, were approved and a treasurer's report heard.

The President, Mrs. Sadowsky, reported on her very busy schedule since taking office in April. She has held two meetings of the Executive Board; has attended the annual meetings and installed officers for seven of the component auxiliaries (Baltimore city, Montgomery, Prince Georges, Cecil, Harford, Washington, and Wicomico counties); has attended the annual meeting of the Woman's Auxiliary to the Student AMA and assisted in the reception following the pre-Commencement exercises of the University of Maryland Medical School; extended greetings from the Auxiliary to the Maryland Health Careers Clubs at their annual statewide meeting in Westminster; represented the Auxiliary at the Maryland Medical Association meeting in Columbia; attended the Maryland State Mental Health luncheon and meeting in Baltimore in June; attended two meetings of the Program and Planning Committee of the Med-Chi Faculty; attended out-of-state medical auxiliary meetings of the Pennsylvania Auxiliary in Hershey, Pennsylvania, New Jersey Medical Auxiliary in Atlantic City, N. J., and West Virginia Medical Auxiliary in White Sulphur Springs, W. Virginia; and attended all meetings of the 46th Annual Convention of the National Auxiliary in New York City. She has prepared and distributed workbooks for all board members, which include a calendar of events for the 1969-70 year and a directory of all component auxiliary officers and committee chairmen. She has plans to visit the Four-County Auxiliary in Oxford, the Baltimore County Auxiliary, and the Allegany County Auxiliary in the next few months. In October, she will attend the Fall Conference for presidents and presidents-elect in Chicago and the Eastern Region Workshops in Washington, D. C.

Each county president reported on her local program for the year, and reports on the progress of AMA-ERF and Community Service projects were heard. Mrs. Elmer G. Linhardt, chairman for AMA-ERF, announced that AMA-ERF Fun(d) Day at the Races would be held again at Laurel Race Track on November 12, 1969. Mrs. G. Allen Moulton distributed brochures she had prepared on the resources for community service available through the ten package programs supplied by the Woman's Auxiliary to the American Medical Association.

A nominating committee, consisting of the following members, was elected: Mrs. George S. Malouf, chairman; Mrs. Charles Bagley, Mrs. Ferdinand Kadan, Mrs. William Holbrook, and Mrs. James Banks.

Following adjournment of the business meeting, the auxiliary membership joined the Faculty at an excellent panel on "Drug Abuse," highlighted by the

facts presented by Harvey Gollance, MD, of New York City, Administrator of the Methadone Maintenance Treatment Program, and Steven V. Sklar, Delegate to the General Assembly of Maryland from the 5th Legislative District, Baltimore city.

During the next two days, members of the Auxiliary joined the Faculty on tours of the new and fabulous Hershey Medical Center, the Amish country, or the Chocolate Factory.

The final dinner on Saturday evening concluded with a surprise talent show presented by Auxiliary members. Mrs. Richard Bauer was mistress of ceremonies and presented Mrs. Elmer Linhardt and Miss Angela Linhardt, pianist, in a "Musical Salute to the Medical Profession." This was followed by a "Salute to Hershey," written and portrayed by Richard Bauer, MD, who received audience assistance in musically bemoaning "Doctor O'Donnell's falling into the chocolate vat." The "Wicomico Kickers," Mrs. Raymond Yow, Mrs. Connie Galton, and Miss Barbara Laughlin, gave a Can-Can performance to rival the best. Vocal honors went to the "Washington Warblers" and the "Harmonizing Honeydrops": Mrs. Howard Weeks, Mrs. H. Leonard Warres, Mrs. Henry P. Laughlin, and Misses Phyllis and Barbara Bauer. The evening concluded with a hilarious "Knobby Knees Contest," won by Dr. Bauer, whose prize was a three-pound Hershey chocolate bar!!!

Reasons for Renal Allograft Success As Compared To Heart Transplants

Robert M. Ollodart, MD
Assistant Professor of Surgery
University of Maryland School of Medicine

Clinical renal allografting has become a complicated, yet successful treatment for end stage kidney failure, while cardiac transplantation remains a clinical experiment. Although renal allografts have been performed for over 12 years, the experience gained fails to fully explain the difference in results with the two types of transplants. Renal transplants are more often successful because they have several advantages over cardiac transplants. In renal transplants, tissue typing can be used to select donors, artificial supportive techniques (dialysis) can substitute for the kidney's functions while a donor is being selected and during rejection crises, and rejection is more easily diagnosed at a time when reversal with immunosuppressive drugs is still possible.

Tissue Typing

There are two major histocompatibility systems in the human: the HLA (Human Lymphocyte Antigen) system and the ABO blood group system. HLA antigens are found on virtually all nucleated cells as well as platelets, and A and B antigens are found not only on red cells, but essentially all other body cells. ABO matching is accomplished by red cell typing. HLA matching involves identification of HLA antigens (at least ten of which are well defined and another eight poorly defined) on the surface of lymphocytes by the cytotoxic or agglutinating effect of typing sera. These sera are obtained from multiparous women who become sensitized to fetal HLA antigens they do not possess, patients who have become sensitized by multiple transfusions (containing lymphocytes), and patients who have rejected allografts and have not been re-transplanted.

HLA antigens are inherited through closely linked genes on a single chromosome. This arrangement allows family genotyping to be made. Parents (genotype AB and CD) give one chromosome to each child so that four sibling genotypes (AC, AD, BC, BD) occur equally. A child who needs a kidney may be any one of these and has a 25% chance of sharing both parental chromosomes with another sibling (HLA identical), a 50% chance to share one (one allele difference), and a 25% chance to share none (two allele difference). Parents must be one allele different than their children. Grafts between an HLA identical donor and recipient have an excellent prognosis since only minor histocompatibility loci difference must be dealt with by immunosuppression.

Such matches usually have no major rejection crises, usually require lower drug dosage, and have four-year survival rates of close to 90% in some series. One allele difference grafts show a 70%-80% four-year survival and two allele difference grafts are comparable to unrelated cadaveric transplants (20%-50% survival). Paired organs and dialysis allow the best living related donor to be chosen and prepared for transplantation. Cardiac donors are non-related.

Cadaveric donor selection for both renal and cardiac transplants relies on choosing the donor with the least number of mismatches. While this is definitely advantageous, the individual case may belie the typing outcome. Not all antigens are measured and serious mismatches may go undetected, contributing to irreversible rejection in the face of "a good match." In cardiac patients, the inability to keep patients alive while a poor match is refused and a better one awaited further restricts advantages available through typing.

Diagnosing Rejection

Reversal of organ rejection depends in part on early diagnosis. Rejection symptoms such as enlargement and tenderness of the easily palpated renal transplant, fever, leukocytosis, decreased urinary output, rise in blood pressure, elevated BUN and creatinine usually occur in time to increase the steroids or antilymphocyte globulin or both, and save the graft. Cardiac rejection often goes undetected until the resulting functional impairment eventually causes the patient's death. Voltage changes on the EKG have not been reliable indicators of rejection in man or animals. Better methods of diagnosing rejection are needed for all organ transplantation, but most particularly for cardiac transplantation.

Functional Support of the Patient

Many renal rejection crises are accompanied by anuria for a certain period, during which hemodialysis supports the patient. Such crises may last many days before reversal occurs. Cardiac patients have no adequate support during this period. While nephrologists have witnessed the successful use of "artificial kidneys" and organ transplants in treating their patients, cardiologists await the development of circulatory assist devices for similar success.

The development of specific immunological tolerance to histocompatibility antigens is needed to produce further advances in all organ transplantation. Recent isolation of such antigens and some success in producing their specific tolerance indicate a rapidly approaching era when the dangerous immunosuppressive drugs now used will not be necessary. Organs capable of being transplanted but usually rejected (heart, lung, and liver), will then remain while their new host may still repulse infectious organisms.

SKIN PROBLEMS

For Safe, Sure, Speedy Relief — — Get RESINOL GREASELESS!

Medical Scientists have conquered 6 dread diseases in the past decade, but they are largely in the dark, they admit, in finding relief for one age-old ailment—itching

New remedies containing antibiotics have been tested, but have often caused side effects which are worse than itching skin. After many years of research and testing, Resinol Greaseless Cream was developed. . . . A doctor's formula containing safe yet powerful ingredients, Resinol Greaseless contains an amazing, proven "anti-itch" medication called Resorcin, which quickly and effectively relieves most any kind of itching. Try Resinol Greaseless . . . You'll be delighted to find that it really works! At all drug stores. Buy a tube today.

A Man Named Tufti

Some Thoughts on Police Officers, Diabetics, and Alcoholics

IRVING B. ZEICHNER
Chief, Legal Research
Administrative Office of the Courts in New Jersey
Former Judge of the Atlantic Highlands Municipal Court

This is the text of a talk presented by Judge Zeichner before the Monmouth County Safety Council at The Ferry, Brielle, N.J., on January 16, 1969. Reprinted by permission of Public Health News, *New Jersey State Department of Health, March 1969.*

I welcome this opportunity to talk to public-spirited people who find time for the kind of community service that usually attracts little attention. What I want to discuss is something most unusual that happened to a man nobody knows—a man named Tufti.[1]

Mr. Tufti was a diabetic who required medication to control that disability. Moreover, he was required to eat at scheduled intervals to attain a balance between medication and food. One day he went fishing. He took his boat for a spin in Puget Sound near Tacoma, Washington. He had his medication and he had eaten breakfast. The time was 9 AM, and it was necessary that he eat again promptly at noon. So he fished until 11 AM, and secured the boat. This is the last thing he remembered until he awoke much later in the drunk tank at the Tacoma city jail. What had happened?

At 2:24 PM, the police, in response to a call, found Mr. Tufti slumped over the wheel of a small foreign automobile, facing the wrong direction on a one-way street. The officers checked the man's pulse, shook him awake, and helped him out of the car. They thought that he smelled of alcohol, and his eyes were bloodshot. His walk was unsteady and his speech slurred. Thus satisfied, the officers placed him in the back of the patrol car where he answered their questions, but failed to tell them of his diabetic condition. However, after considerable effort, he did produce a wallet containing his driver's license. It also contained a card which stated: "I am a diabetic. I am not intoxicated." Since the officers did not see the card, they concluded that Mr. Tufti was drunk and impounded his vehicle. He was taken to the city jail where he was charged with being drunk in an auto.

At the jail, Mr. Tufti was booked and searched. The contents of his pockets were removed, as was the money from his wallet. The time was approximately 3 PM. Mr. Tufti, apparently asleep, was left on the drunk tank floor.

Meanwhile, back at home, Mrs. Tufti became alarmed when her husband failed to return for lunch. She checked at the boat mooring and contacted the police. She informed them that she feared her husband was in insulin shock and gave them a description of the car and its license number. Mrs. Tufti also called the family physician. He in turn notified the police to watch for Mr. Tufti, who could be slumped over the wheel of his car in a state of shock.

Back at the drunk tank in the city jail, Mr. Tufti remained unconscious until about 3 AM the following morning. When he regained consciousness and discovered where he was, he called the officers. He

1. Plaintiff in Tufti v. City of Tacoma, 431 P.2d 183 (1968). The sequence of events is taken almost verbatim from the opinion.

was allowed to bail himself out for $35. He was released and given a bag containing his possessions, including his sugar, saccharine tablets, billfold, and driver's license. It also contained his diabetic card. Mr. Tufti ate some sugar lumps and called his wife.

Mrs. Tufti found her husband on the street in a dazed condition. She complained to the chief of police and, after an investigation, the drunk charge was dropped. A charge of negligent driving was substituted and later dismissed. Mr. Tufti immediately sued the city of Tacoma and its police chief for false arrest and imprisonment.

At the trial, the chief testified that all officers are trained to detect the symptoms of a diabetic and to check for such signs when a person is arrested on drunken charges. He stated that the department followed the established policy of holding all intoxicated persons for four hours. The jailer testified that if someone who is jailed appears to be ill —"even so much as a bad cold," the jail is obligated to send him to a facility for care. The suit against the chief of police was dismissed. But a judgment was entered against the city, and in favor of Mr. Tufti.

The Supreme Court of Washington affirmed the liability of the city on the grounds that even though Mr. Tufti appeared to be drunk, there was no justification for holding him. In fact, he should have been released and given immediate care.

Courts seldom fail to blame the city for negligence resulting from lack of police training. In the leading case of McAndrew v. Mularchuk,[2] a reserve policeman who had been assigned to special duty at a tavern accidentally shot a minor who was either coming toward him or running from him—depending on whose testimony you believed. The New Jersey Supreme Court held that the Borough of Keansburg was subject to damages for the minor's injuries if the police chief had assigned an officer to duty without giving him proper training in the use of firearms.

If lawsuits are to be avoided and, more important, if lives are to be saved, it is incumbent upon municipalities to train all officers to distinguish between a diabetic and an alcoholic. Those not trained to detect the signs of insulin shock can easily label the diabetic as a drunk. There is the same staggered walk, slurred speech, dilation of pupils, disorientation, and even loss of memory.

The diabetic should wear the Medic Alert bracelet identifying his condition. This is a wise precaution for anyone with a hidden medical problem that should be known in case of an emergency.

But what if Mr. Tufti had indeed been alcoholic instead of diabetic? There is little disagreement that alcoholism, as a chronic disease or behavior disorder, is a major public health problem in this nation.

Some studies show that there are as many as 7 million alcoholics and half as many additional problem drinkers in this country. In fact, the use of alcohol is so widespread that it is extremely difficult to enact or enforce effective laws governing its use and abuse. One result is that alcohol contributes to, or is associated with, at least half of our fatal traffic accidents. Many other crimes, such as homicide, are usually alcohol-related.

Even more startling, perhaps, is the report of the President's Crime Commission [3] stating that one of every three arrests in the United States is for public drunkenness. Two million annual arrests for this offense clog the courts, crowd the jails, and overburden the police department.

Of the two million annual drunk arrests, many of those arrested are chronic offenders. Despite the fact that drunkenness is not a crime, a substantial number of alcoholics with histories of prior arrests have served long terms behind bars. Most repeaters live and die on "skid row," well described as the dilapidated urban area where "substandard hotels and rooming houses are intermingled with numerous taverns, pawn shops, cheap cafeterias, employment agencies that specialize in jobs for the unskilled, and religious missions that provide free meals after services."

The police do not arrest all drunken persons: some are assisted to their houses. Only when he appears to have no home or family is a person most likely to be arrested and taken to jail. Perhaps he will be permitted to sleep it off in the tank, a barren cell holding one or two prisoners, or as many as 200. Sometimes there is not room to sit or lie down. Although the tank is certainly not a hospital, perhaps it should be, since a chronic alcoholic generally suffers from a variety of ailments and is often in danger of contracting serious medical complications.

As long as a defendant is serving his sentence, he is fed and sheltered. When his time is up, he is likely to return to his former environment, with no job, no money, and no plans. He is frequently arrested again within a matter of days or even hours. This seems to indicate that our criminal justice system is ineffectual in deterring drunkenness, or in meeting the problems of the chronic alcoholic. However, the system does remove the drunk from public view and provides him with a brief period of forced sobriety. But the system cannot meet his underlying medical and social problems.

If, as some people suggest, alcoholism is not a crime but a disease, why are so many people being needless-

2. 162 A.2d 820 (1960).

3. The Challenge of Crime in a Free Society (1967).

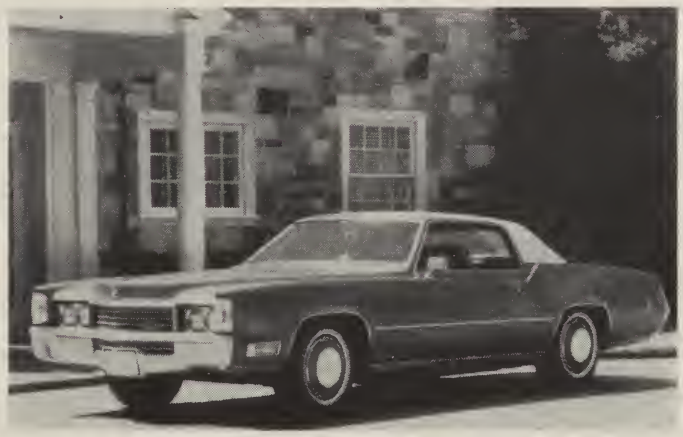
ly jailed? The United States Supreme Court recently faced this question in a test case.

A 67-year-old bootblack named Powell was charged with public intoxication, thus violating the Texas penal code. Psychiatrists testified that the defendant, who had been jailed on intoxication charges at least 73 times over a period of years, was a chronic alcoholic. The defense maintained that to convict a chronic alcoholic and sentence him to such cruel punishment as jail violated the Eighth Amendment to the Constitution.

The Supreme Court upheld the conviction of the chronic alcoholic: ". . . Facilities for the attempted treatment of indigent alcoholics are woefully lacking throughout this country. It would be tragic to release large numbers of helpless, sometimes dangerous and frequently unsanitary inebriates to the streets of our cities, without even the opportunity to sober up adequatcly which a brief jail term provides . . . Yet the medical profession cannot and does not tell us with any assurance that, even if the building, equipment and trained personnel were made available, it could provide anything more than slightly higher class jails for our indigent habitual inebriates." [4]

In inferior jails, the term served for drunkenness is short. But with a civil commitment, the term is "until cured," giving the prisoner no hope of receiving effective treatment and with no prospect of periodic freedom. What should be done to improve the present situation? Perhaps the drunkenness statutes should be repealed. But the President's Crime Commission recommended that disorderly and other criminal conduct accompanied by drunkenness should remain punishable as separate crimes. The Commission also suggested that there ought to be detoxification stations, as part of comprehensive treatment programs with extended after-care facilities. It was also suggested that there be routine medical evaluation of all individuals suspected of intoxication and taken into custody by the police, and routine training of police officers in handling public intoxication cases.

Research into alcoholism, the problems of alcoholics, and methods of treatment, would save $2 billion lost to industry each year due to the alcoholic problems of employees. Such research would save lives—not only the lives of alcoholics, but of the non-alcoholics, such as Mr. Tufti. It might even avoid lawsuits. These recommendations ought to be argued, debated, and discussed. The public cannot be expected to respect a system of public health or criminal justice that discards people or deposits them in jail because they are sick, whether diabetic or alcoholic.



4. Powell vs. Texas, 392 U.S. 514 (1968).

DOUGLAS G. CARROLL, MD, EDITOR

Part II: Spinal Cord Injuries

In no medical condition is the gap between theoretical and applied knowledge greater than in the treatment of cord injuries. We know how these patients should be treated; we are generally unable to apply what we know.

1. We know, for example, that the patient must be turned frequently and kept dry to prevent decubitus ulcers. The facts are that few patients complete their first month without developing major ulcers.

2. We know that a coordinated program integrating the efforts of the neurosurgeon, orthopedic surgeon, urologist, physiatrist, and psychiatrist is essential in the early care of the patient. It is rare indeed that an ideal program is carried through without a breakdown or delay in the coordination of these specialists.

3. We know that continuity of care under a single doctor is the best plan for long term care. Rarely is a patient with complete cord severance able to find a single doctor or even a single hospital to turn to throughout his life.

The following case was presented at a student conference held at the Baltimore City Hospital (BCH) to focus attention on some of the management problems of patients with chronic diseases. The conference was held six months after the patient's admission to the BCH for an epidural abscess.

Student: This is the first BCH admission for Mr. S. (BCH # 452934), 24 year-old mechanic, who complained of having weakness of the lower extremities for 12 hours. One year prior to admission he suffered a "whip-lash" injury to his neck, and wore a brace for several months. Eighteen days prior to admission, he noticed a boil on his right elbow. His wife put some black "drawing" salve on it, and it drained. However, his arm became sore, and 16 days prior to admission to BCH, he reported to that hospital's emergency room. At this time the boil was debrided and cultured (staphylococcus aureus, coagulase positive). The patient was given penicillin and streptomycin and told to return for further examination. He reported back twice, and the lesion healed completely.

Ten days before admission to the hospital he began to have continuous dizziness, and pain in the chest and back. He received some pills for pain from his doctor, who recommended that he go to the emergency room of a local hospital. He did not follow his doctor's suggestion. On the day of admission, the pain in his chest and arms returned, his legs became numb, and by afternoon he had total paralysis of both legs.

Doctor: Could you tell us something about the pain in your chest?

Mr. S.: It was like a sharp pulling, someone sticking me in the back.

Doctor: Did it stay in one place?

Mr. S.: It came around the sides when I moved my arms.

Doctor: How come you didn't go to the hospital after your doctor suggested that you go?

Mr. S.: Well, I told my wife I would wait. It didn't really bother me because I didn't have any pain. I told my wife I couldn't move my legs, and she didn't believe me at first.

Student: Admitted to the hospital, the patient was examined. His rectal temperature was 102°, the pulse 90, respiration 20, and the B.P. 110/70. He was able to move only his arms and head. On the neurological examination, the patient was well oriented. The cranial nerves were intact. The neck was stiff. He had dysesthesia below T8 and hypesthesia from L1 to S3. Vibration sense was intact in the lower extremities. Temperature and position sense were lost in the lower extremities. A diagnosis of epidural abscess was made.

Laboratory findings were normal except a white cell count of 36,000. On the lumbar puncture, the opening pressure was 130, closing pressure 80. The fluid was slightly xanthochromic; Pandy 3+. There were no cells, and glucose was 22 mg%.

A myelogram was done which did show complete block at the level of T6-7. He was taken to the operating room, and a laminectomy was performed. Five cc of yellow pus grew coagulase positive staphylococcus aureus. The organism was sensitive to penicillin and the patient was started on a high dose of that drug. Over the next few days there was gradual return of sensation.

Doctor: Can you tell how he has been in the six months since surgery?

Student: He has had quite a bit of trouble with urinary tract infections. Now he is very much better. He has been on physical therapy for six months, and he is coming along quite well. He has returned home three weekends now, and he is able to walk on crutches and walk a little without crutches. He had leg weakness, increased tone, and mild knee flexion contractures.

Doctor: Let's take a look at him now. His arms are all right. He has a little clonus when he stands or puts weight on his legs. Let's have him walk. Keep your head up when you walk. Can you tell where your feet are?

Mr. S.: They feel a little stiff and swollen.

Doctor: He is using a four point gait with crutches. He can also walk with a walker, but he prefers crutches. I would like to ask you just a few questions before you go. How do you think this difficulty you have walking is going to effect what you do in the future?

Mr. S.: Well, the type of work I am doing, it is going to be hard to say. If I can get to where I can bend over again and get my legs straightened out, I'll be all right.

Doctor: Is there any other kind of work you could do?

Mr. S.: Well, I fooled with radios and stuff like that. I never really had any training for it.

Doctor: Your possibility might be some kind of radio repair, TV repair if you couldn't do automobile mechanical work. That's what you've been doing.

Mr. S.: That's what I've been doing, yes.

Doctor: What bothers you most now?

Mr. S.: Well, right now it is the shaking in this leg.

Question from audience: What do you do when you get discouraged?

Mr. S.: Just keep going. There for awhile I was ready to give up. Then I found I could get on crutches and now I am all right.

Doctor: Why were you ready to give up?

Mr. S.: Well, I just didn't think I had it in me, you know, to keep going.

Question from audience: Mr. S., has your social worker helped you?

Mr. S.: She has helped me a good bit, but they changed them around, different ones.

Question from audience: What is she doing for you now?

Mr. S.: Well, she helped my wife get straightened out on a lot of things for me as far as that goes.

Doctor: O.K., thank you for talking with us. (Patient leaves.)

Student: Well, he did have some financial problems. This bothered him somewhat. I think this may have contributed to his depression. His wife and three children, aged 8 months to 4 years old, are here in Baltimore and living with her mother. Evidently they didn't have any support, and so it was necessary to contact the welfare to see if they could be taken care of somehow. And they also hadn't been able to come in to visit him. I think there was a transportation problem, and I think that was taken care of through the social worker. So that helped quite a bit. I also think that his trips home on weekends did help to lift his spirits a little bit.

Doctor: So this patient, besides the physical problem, did have very significant emotional and social problems, which hopefully, at least for the time being, have been solved to some extent.

Student: I think so. He carries on an industry here in the hospital. I noticed last night he had a set of tools he had been carrying around in the wheelchair, and he has also been carrying around a radio for someone that needs repairing.

Doctor: We have shown this patient for several reasons. The first is to stress the importance of making an early diagnosis of epidural abscess. There are four stages to this disease that are well illustrated in this patient. First, he had a documented staphylococcus furunculosis. This was treated very well. It was drained, and he was given high doses of penicillin and streptomycin. He then developed back pain, was seen by a doctor, and given more penicillin. If the patient is examined at this second stage, an area of tenderness or swelling over the back where there is an abscess may be found. Next, if not treated then, the patient may develop pain around the chest or in the abdomen where the abscess is pressing on a root. Finally, the cord itself is affected, and the patient develops paralysis. In the management of this patient, a number of things went wrong. First, he went from doctor, to emergency room, to doctor, and no single physician knew just exactly what was going on. Secondly, he delayed coming to the hospital after he developed paralysis of the legs, and one wonders just what this means in terms of his intellectual and emotional pattern. Was he just so stupid that he didn't know that paralysis of the legs is a bad thing, or was he so scared that he was afraid to come to the hospital?

When he got into the hospital, an immediate diagnosis was made. Every minute counts with an epidural abscess. It is not a common condition, but it is one any doctor may see; it is curable if recognized early enough.

This man has been extremely fortunate. Three weeks after admission, he was completely paralyzed in his legs, and furthermore, he developed ulcers over his trochanter. Since three weeks had gone by with no return of function, the outlook was poor. However, since then he has gradually improved.

Psychiatrist: Another important feature is the patient's emotional reaction to his disease. It was very important for him to maintain his role as father. Social Service has been helpful in allowing him to make decisions about caring for his family while in the hospital. It would have been much simpler to have worked with the wife and for her to do all this herself than to bring him in on the decisions about family problems. However, involvement in decision making for his family helped to maintain his feeling of importance.

The other interrelated area is his sexual function. This man's sexual function is normal and extremely important to him.

Doctor: Could you tell us anything about his social background?

Student: He is married, has three children and has supported them as a garage mechanic. He was born in Virginia, went through the eighth grade, became interested in cars, and taught himself to be a garage mechanic. He has wandered between his family in West Virginia and his wife's family in Baltimore during his married life. For one year prior to admission, he and his family lived with his wife's mother in Baltimore.

Social Worker: I think this case illustrates what a Department of Social Service can do in a hospital. We have attempted to preserve this man's role as husband and father and at the same time have attempted to give him a helping hand with important decisions for his family. He is only 25 years old himself and his wife is 22. There are three small children. This man represents the problem of Appalachia brought to Baltimore.

On the one hand, he is self-taught, has developed his own skills, and has been able to support his family with what he has taught himself. He has a very strong will and this, with his motivation, has carried him through much of the present situation.

On the other hand, both he and his family are ignorant about the resources of the community which might be of help to them and do not know how to go after what they need. He has been in a kind of slump because he is a boy from the country and really doesn't know what to do in the city. When he first became ill, his family separated. They went to relatives, but this was a very unsatisfactory solution since the wife and children didn't like where they were and were very crowded. The Baltimore County Welfare Board picked the family up, but the patient lost contact with his wife for awhile and became very anxious about the family's welfare. He very nearly signed out of the hospital in an attempt to go and find them himself. This, of course, was not a realistic solution to his problem and the Social Service Department was brought into the picture at this time, was able to locate the family and to place it in a situation which was acceptable to the wife, children and husband.

The patient was allowed to go home on weekends to play with his children and to reassure himself that they were getting along well and that he was the father and husband in the family.

Comment

There are sudden catastrophic disruptions in the psychosocial life of a patient suffering a spinal cord injury. The final adjustment of the patient to his disability will depend on the severity of the injury, the past pattern of life, and how he accepts the new roles imposed on him. The final outcome of the patient with a spinal cord injury, assuming good medical care is given, basically depends on the patient himself. The doctor can serve only as advisor and supporter.

This can be better understood by considering the roles that the patient played at different stages in the course of the disease.

1. *Pre-morbid Roles:* The patient was, in a number of ways, a typical product of Appalachia. He was poorly educated and fiercely independent. He had educated himself as an automobile mechanic and had started a family to which he was extremely loyal. His wife's parents lived in Baltimore; his own in West Virginia. Employment opportunities were greater in a large city, but his roots were in West Virginia. He saw himself as undisputed family decision maker, a successful self-made man and provider for his family.

2. *Early Hospital Course:* He played the passive role of patient during the early course of his disease, accepting without question the technical decisions made by the physicians.

3. *Recovery:* As he progressed beyond the acute stage, demands were placed on him for an active part in his rehabilitation program. He became depressed at his slow recovery and began to think that he was not going to make it. Fortunately he suffered few of the major complications of severe spinal cord injuries and began to recover muscle function. He then reasserted his role as decision maker for the family, and with the help of the Social Service Department, was actually helped to play this role.

4. *Post-hospital Roles:* Although inspired for a brief period to take advantage of vocational training opportunities, he did not follow through. His present role in life appears to be much the same prior to hospitalization.

Summary

Successful rehabilitation of a patient with a spinal cord injury requires meticulous attention to the psychosocial dimension as the patient's role changes from that of a passive patient to that of a participant in his re-entry into the community.

Information for Authors

MANUSCRIPTS: Manuscripts will be accepted for consideration for publication with the understanding that they are original, have never before been published, and are contributed solely to the Maryland State Medical Journal.

All manuscripts are acknowledged upon receipt and are followed up by notification of either acceptance or rejection. Rejected manuscripts are returned by regular mail. Accepted manuscripts become the property of the Journal and are not returned. The Journal is not responsible for loss of manuscripts through circumstances that are beyond its control.

Manuscripts should be addressed to: Editor, Maryland State Medical Journal, 1211 Cathedral St., Baltimore, Md. 21201.

SPECIFICATIONS: Manuscripts must be original typed copy, doublespaced throughout (Including text, case reports, legends, tables and references) with margins of at least 1½ inches. Pages should be numbered consecutively.

The manuscript should include the title (brief and concise), the full name of the author (or authors) with degrees, academic and professional titles, affiliations, and any institutional or other credits. Please include a complete address where the author may receive proofs of his article for his approval and corrections.

All manuscripts should be accompanied by a carbon or Xerox copy and the author should retain another copy for his records.

TABLES: Each table should be typed on a separate sheet of paper, be numbered, have a brief descriptive title, and its position in the text should be indicated.

Be sure that statistics are consistent in both tables and text.

REFERENCES: References should be limited to those citations noted in the text, and kept to a minimum of 18. (A complete review of the literature is rarely desirable.) The references must be typed, doublespaced, and are to be numbered consecutively as they appear in the text, with their positions in the text indicated. An alphabetized bibliography is used only when the listing is of books suggested for supplementary reading.

All references must be checked for absolute accuracy. Each journal reference must include author(s) and initials, complete title of article, name of publication, volume, first page of article, and date. Complete dates (month, day, and year) are to be included with all references that have appeared within the last three years. Include with book references name of author(s) and/or editor(s) with initials, title of book, edition, location, publisher, year, volume (if given), and page. If reference is to a chapter within a book, include the author of the chapter (if different from author of the book), and the title of the chapter, if any.

ILLUSTRATIONS: Authors are urged to use the services of professional illustrators and photographers when possible. Drawings and charts should always be done in black ink on white paper. Clear, glossy photographs, black on white, should be submitted and such illustrations numbered consecutively and their positions indicated in the text.

Magnifications will be modified in proportion to the amount of reduction necessary to fit the pages of the Journal. Please do not deface an illustration by writing on the front or the back, nor should it be taped or pasted to paper. The illustration may be pasted onto a piece of cardboard. Attached to the back of each illustration, chart or photograph should be the figure number, the author's name and the title of the article.

Legends for illustrations should be typewritten on a separate page with numbers corresponding to those on the photographs and drawings.

Recognizable photographs of patients are to be masked and should carry with them written permission for publication.

EDITORIAL RESPONSIBILITY: Manuscripts are subject to editorial modification and such revisions as are necessary to bring them into conformity with Journal style.

Statements made or opinions expressed by any contributor in any article or feature published in the Journal are the sole responsibility of the author.

PERMISSIONS: When material is reproduced from other sources, full credit must be given to both the author and publisher and written permission from these sources must be included when the material is submitted.

COPYRIGHT: Material that is published in the Maryland State Medical Journal is protected by copyright and may not be reproduced without the written permission of both the author and the Journal.

from the discord of anxiety...

to emotional harmony

with the aid of antianxiety

Librium®
(chlordiazepoxide HCl)
5-mg, 10-mg and 25-mg capsules

In an age of swift change and challenge, susceptible individuals may experience varying degrees of excessive anxiety. The resulting emotional stress may precipitate significant functional disorders or complicate existing organic disease. In properly individualized maintenance dosage, Librium (chlordiazepoxide HCl) quickly helps relieve anxiety and apprehension, provides useful adjunctive therapy in psychophysiologic disorders—yet seldom impairs mental acuity or ability to function. Librium has demonstrated a wide margin of safety in short- and long-term therapy.

Also available:

Libritabs®
(chlordiazepoxide)

ROCHE

LABORATORIES
Division of Hoffmann-La Roche Inc.
Nutley, New Jersey 07110

Before prescribing, please consult complete product information, a summary of which follows:

Indications: Indicated when anxiety, tension and apprehension are significant components of the clinical profile.

Contraindications: Patients with known hypersensitivity to the drug.

Warnings: Caution patients about possible combined effects with alcoho and other CNS depressants. As with all CNS-acting drugs, caution patien against hazardous occupations requiring complete mental alertness (e.g., operating machinery, driving). Though physical and psychological dependence have rarely been reported on recommended doses, use caution administering to addiction-prone individuals or those who might increase dosage; withdrawal symptoms (including convulsions), following discontinuation of the drug and similar to those seen with barbiturates, have been reported. Use of any drug in pregnancy, lactation, or in women of childbearing age requires that its potential benefits be weighed again its possible hazards.

Precautions: In the elderly and debilitated, and in children over six, limit t smallest effective dosage (initially 10 mg or less per day) to preclude ato or oversedation, increasing gradually as needed and tolerated. Not recommended in children under six. Though generally not recommended, combination therapy with other psychotropics seems indicated, carefully consider individual pharmacologic effects, particularly in use of potentiat drugs such as MAO inhibitors and phenothiazines. Observe usual precautions in presence of impaired renal or hepatic function. Paradoxical reactions (e.g., excitement, stimulation and acute rage) have been reported in psychiatric patients and hyperactive aggressive children. Emp usual precautions in treatment of anxiety states with evidence of impending depression; suicidal tendencies may be present and protective measure necessary. Variable effects on blood coagulation have been reported very rarely in patients receiving the drug and oral anticoagulants; causal relationship has not been established clinically.

Adverse Reactions: Drowsiness, ataxia and confusion may occur, especially in the elderly and debilitated. These are reversible in most instances by proper dosage adjustment, but are also occasionally observed at the lower dosage ranges. In a few instances syncope has been reported. Also encountered are isolated instances of skin eruptions, edema, minor menstrual irregularities, nausea and constipation, extrapyramidal symptoms, increase and decreased libido—all infrequent and generally controlled with dosage reduction; changes in EEG patterns (low-voltage fast activity) may appear during and after treatment; blood dyscrasias (including agranulocytosis), jaundice and hepatic dysfunction have been reported occasionally, making periodic blood counts and liver function tests advisable during protracted therapy.

the right attitude:

The right attitude has earned us an enviable reputation in Baltimore's wide spectrum of health care establishments. We feel that our approach to the problems of the elderly, chronically ill, and convalescent patient makes us different.

Our *people* are not only doing a job but also giving of themselves beyond the call of duty to provide our guests with more than the average amount of service expected.

If the right attitude is what you're looking for . . . concerning a day & night vigil by professional nurses . . . individually programmed meals under the control of our staff dietician — physical, occupational, recreational therapy designed to reach a goal in the patient's care and well-being . . . a pleasant home-away-from-home atmosphere . . . Edgewood Nursing Home should be your first preference.

WATCH FOR OUR GRAND OPENING:

By the first of the year — our completely new 100 bed facility will be finished — we are Baltimore's most centrally located nursing home. Minutes from Towson. Roland Park, Homeland and all of Northern Baltimore's hospitals.

HYNSON, WESTCOTT & DUNNING, INC. BALTIMORE, MARYLAND 21201

(LTR23)

He is a diabetic.
He is middle-aged.
When he needs an antibiotic he may be a candidate for

DECLOSTATIN® 300

Demethylchlortetracycline HCl 300 mg and Nystatin 500,000 units CAPSULE-SHAPED TABLETS Lederle

b.i.d.

To guard susceptible patients against intestinal monilial overgrowth during broad-spectrum therapy—the protection of nystatin is combined with demethylchlortetracycline in DECLOSTATIN.

For your susceptible candidates, prescribe DECLOSTATIN —the broad-spectrum therapy that prevents monilial overgrowth.

Effectiveness: Because its antibacterial component is DECLOMYCIN Demethylchlortetracycline, DECLOSTATIN should be equally or more effective therapeutically than other tetracyclines in infections caused by tetracycline-sensitive organisms. The antifungal component, Nystatin, protects against superinfection by antibiotic-resistant fungal overgrowth (particularly monilia) in the intestinal tract.

Contraindication: History of hypersensitivity to demethylchlortetracycline or nystatin.

Warning: In renal impairment, usual doses may lead to excessive accumulation and liver toxicity. Under such conditions, lower than usual doses are indicated, and, if therapy is prolonged, serum level determinations may be advisable. A photodynamic reaction to natural or artificial sunlight has been observed. Small amounts of drug and short exposure may produce an exaggerated sunburn reaction which may range from erythema to severe skin manifestations. In a smaller proportion, photoallergic reactions have been reported. Patients should avoid direct exposure to sunlight and discontinue drug at the first evidence of skin discomfort. Necessary subsequent courses of treatment with tetracyclines should be carefully observed.

Precautions: Overgrowth of nonsusceptible organisms may occur stant observation is essential. If new infections appear, appro measures should be taken. In infants, increased intracranial pr with bulging fontanels has been observed. All signs and symptom disappeared rapidly upon cessation of treatment.

Side Effects: Gastrointestinal system—anorexia, nausea, vomiting, rhea, stomatitis, glossitis, enterocolitis, pruritus ani. Skin—macul ular and erythematous rashes; a rare case of exfoliative dermatit been reported. Photosensitivity; onycholysis and discoloration nails (rare). Kidney—rise in BUN, apparently dose related. Tra increase in urinary output, sometimes accompanied by thirst (Hypersensitivity reactions—urticaria, angioneurotic edema, anaphy Teeth—dental staining (yellow-brown) in children of mothers give drug during the latter half of pregnancy, and in children given the during the neonatal period, infancy and early childhood. Enamel plasia has been seen in a few children. If adverse reaction or idi crasy occurs, discontinue medication and institute appropriate the Demethylchlortetracycline may form a stable calcium complex ir bone-forming tissue with no serious harmful effects reported thu in humans.

Average Adult Daily Dosage: 150 mg q.i.d. or 300 mg b.i.d. Shoul given 1 hour before or 2 hours after meals, since absorption is imp by the concomitant administration of high calcium content drugs, f and some dairy products. Treatment of streptococcal infections sh continue for 10 days, even though symptoms have subsided.

LEDERLE LABORATORIES

Maryland State Medical Journal

VOLUME 18 DECEMBER 1969 NUMBER 12

CONTENTS:

Editorial—Senate Bill 404: A Working Solution to the State's Health Problems, John Sargeant 68

Electrodes for Cardiac Monitoring in the Coronary Care Unit: Description of the Disposable Daisy Electrode, John J. Curry, MD 69

"Cardiac monitoring experience in the Holy Cross Hospital Coronary Care Unit, over a three-year period, is reviewed in respect to the various types of monitoring electrodes employed."

Clinical Uses of Central Venous Pressure, Neil A. Robinson, MD ... 73

"Central venous pressure monitoring (CVP) has become a routine procedure on the wards of most hospitals. Its simplicity and reliability recommend its use in a variety of clinical situations."

Sickle Cell Disease in Pregnancy—A Report on Exchange Transfusions, Norman Levin, MD, Desideria Tabanao-Mahusay, MD 75

"Sickle cell disease is a most serious hemoglobinopathy, complicating pregnancy and causing alarming rates of fetal wastage and maternal mortality. The purpose of this report is to present two recent cases of sickle cell anemia in pregnancy. Both patients were treated with lifesaving transfusions in the obstetrical department of a small community hospital."

Phlebography in Leg Complaints, Salvatore J. DeMarco, III, MD ... 78

"The first phlebograms were performed in man by Berberich and Hirsch in 1923, using Strontium bromide as the contrast material. In 1931, Sgalitzer, Kolbert and Demel described a more acceptable technique. Classic monographs on phlebography of the lower extremities were produced by Bauer and Hellsten in 1940, concerning their study of the effects of heparin therapy in thrombophlebitis. Accepted enthusiastically at first, the technique was soon abandoned due to difficulty with the radiologic technique, contrast material, injection sites, and equipment.

The Mercy Hospital series of 100 phlebograms, begun in 1964 and continued through March 1968, is an attempt to find a more logical approach to the treatment of varicose veins than those that have been reported in the literature."

The Nutritional Status of C/Y Center Children, Alexander J. Schaffer, MD 83

"In February of 1968 the Baltimore City Health Department was asked to participate in a nutritional survey of all children in the Comprehensive Care Clinics across the country. This was to be a cross-sectional study of all the infants and children who appeared for any reason at each center during the months of March and April of 1968. It presented us with a good opportunity to study our own population in Baltimore."

Attending Annual Meeting of the Medical and Chirurgical Faculty.
All requests subject to confirmation.

We recommend **CAMP**

SACRO-ILIAC SUPPORTS

Scientific block and tackle lacings cause the durable Camp material to firmly encircle the bony pelvis, in conservative treatment of sacro-iliac conditions. This basic Camp model also provides upper adjustment to balance the support or to ease spasm and pain, depending on the needs of the wearer. Effective for relief of effects of disease and moderate low back injury.

CAUTION ON NARCOTICS

The Bureau of Narcotics and Dangerous Drugs, of the U.S. Department of Justice, has brought to the Faculty's attention the Federal law stating that Class A Narcotics prescriptions may not be telephoned to a pharmacist, except in dire emergencies.

While this may create hardships for some patients, they should recognize that such requests place the physician in jeopardy for violation of the Federal law.

PLASTIC TONGUE DEPRESSORS

A recent Congressional inquiry into a statement circulated by a midwestern hospital supply company revealed the necessity of verifying statements made by companies and individuals.

The supply company distributed a circular stating that wooden tongue depressors had been declared unsafe and unfit for human use by the U.S. Food and Drug Administration.

One institution disposed of its entire supply of wooden tongue depressors and purchased the higher cost plastic ones for replacement.

The hospital supply company is no longer in business.

AMERICAN MEDICAL ASSOCIATION HOUSE MEETS

The Clinical Meeting of the Americal Medical Association House of Delegates met on November 30 of this year. Items under discussion included the controversial report of the Committee on Planning and Development. Because of this report, the House of Delegates established a special Reference Committee to hear comments and remarks on the recommendations contained in the report. Included are:

1. AMA adoption of the World Health Organization definition of Health;

2. Data on the adequacy of health services and the manner in which they are being provided throughout the country should be obtained by the AMA and its components;

AMERICAN MEDICAL ASSOCICATION HOUSE MEETS (cont'd)

3. That the AMA, in conjunction with other heal agencies, continue to explore and develop expedients to overcome health manpower shortgages;

4. That the AMA and its components become mor active in medical economics;

5. That medical representatives to local Blue Pl be currently active in local and national socit affairs and be familiar with society policies.

OTHER NEWS OF INTEREST

At a recent meeting attended by local state society executives it was learned that the National Health Program envisioned by Walter Reuther and being actively promoted through this new "alliance", is not being readily accepted by many of the groups involved in such an "alliance".

Interestingly, the majority of these representatives are opposed to "more government control" as they are disenchanted with the operations of Medicaid and Medicare.

Perhaps it is now being recognized that what can be given by the Government with one hand can be taken away with the other.

ADDITIONAL WARNING TO PHYSICIANS

Physicians throughout Maryland are being deluged with "bills" for listing in the U.S. MEDICAL DIRECTO

Individuals are cautioned about sending in $82 per yea for the cost of such a listing. This is similar to the listings mailed to physicians from California and this group has no connection whatsoever with any official organization.

Physicians are also cautioned that purchase of such a listing would constitute advertising under the Medica Practice Act of Maryland.

very interesting!

Baltimore Federal's savings certificates are a very attractive investment, indeed. They earn interest at our current rate (paid by check at regular quarterly interest periods), then earn a bonus at maturity. You can invest from $1,000 to $11,000 in multiples of $1,000 for either six months or a year and earn a total rate of 5% per annum, guaranteed. From $12,000 up, you can invest for either period and earn a guaranteed 5¼% per annum.

Select the savings plan that best suits your needs, not forgetting our flexible, popular, and convenient passbook account. Of course, your money is insured by the Federal Savings and Loan Insurance Corporation.

Open or add to your account by the tenth and you'll earn our undivided interest for the entire month!

213 West Saratoga St. 727-7011

The concert was just underway,
When to the conductor's dismay
Cramps and diarrhea,
Did so quickly appear,
The maestro no longer could stay.

Because diarrhea with cramping, nausea, and painful straining can
at the most inopportune time, it takes a comprehensive agent to treat the
iarrheal syndrome and help get the patient back on the job. That's why
ny physicians rely on Donnagel, especially during the fall and winter
s when "flu" and viral gastroenteritis usually hit their peak.

Donnagel is much more than just a simple kaolin-pectin combination.
contains the belladonna alkaloids to calm GI hypermotility and help
the distressing discomforts which so often accompany diarrhea. Certainly
s expensive and more convenient than taking two medications. And the
is lower too. Available in the handy 4-oz. plastic bottle at pharmacies
here on your prescription or recommendation.

arrhea and its Discomforts

Donnagel®

uid ounce contains: Kaolin, 6 Gm.; Pectin, 142.8 mg.; Hyoscyamine sulfate,
mg.; Atropine sulfate, 0.0194 mg.; Hyoscine hydrobromide, 0.0065 mg.;
benzoate (preservative), 60 mg.; Alcohol, 3.8%.

CLEAR THE TRACT!

THERE'S A ROBITUSSIN FOR EVERY COUGHING NEED

All the Robitussins contain gylceryl guaiacolate, an outstanding expectorant agent that greatly increases the output of lower respiratory tract fluid. Increased RTF volume exerts a demulcent effect on the tracheobronchial mucosa, promotes ciliary action, and makes thick, inspissated mucus less viscid and easier to raise.

For coughs of colds and "flu"
ROBITUSSIN®
Each 5 cc. contains:
Glyceryl guaiacolate . . 100.0 mg.
Alcohol, 3.5%

Non-narcotic for 6-8 hr. cough control
ROBITUSSIN-DM®
Each 5 cc. contains:
Glyceryl guaiacolate . . 100.0 mg.
Dextromethorphan hydrobromide . . . . 15.0 mg.
Alcohol, 1.4%

For unproductive allergic coughs
ROBITUSSIN A-C®
Each 5 cc. contains:
Glyceryl guaiacolate . . 100.0 mg.
Pheniramine maleate . . 7.5 mg.
Codeine phosphate . . . 10.0 mg.
(warning: may be habit forming)
Alcohol, 3.5%

Clears sinuses and nasal stuffiness as it relieves cough
ROBITUSSIN-PE®
Each 5 cc. contains:
Glyceryl guaiacolate . . 100.0 mg.
Phenylephrine hydrochloride. . . . . 10.0 mg.
Alcohol, 1.4%

Robitussin-DM in solid form for "coughs on the go"
COUGH CALMERS™
Each Cough Calmer contains:
Glyceryl guaiacolate . . 50.0 mg.
Dextromethorphan hydrobromide . . . . 7.5 mg.

Use this handy guide to pick the right formulation for each coughing need

A·H·ROBINS A. H. Robins Company, Richmond, Va. 23220

Patient Referral Requested

The Immunology Branch of the National Cancer Institute is engaged in a broad program of hematopoietic cell transplantation in an effort to correct bone marrow failure and immune deficiencies. A corollary effort is an evaluation of the anti-tumor effects of immune competent cell transplantation into patients with a malignancy. Thus we are considering for admission to this study a limited number of patients with 1) bone marrow failure or malfunction due to a nonmalignant cause, 2) malignancy, 3) an immune deficiency syndrome. Patients should fulfill the following criteria:

a. the disease process will lead to a fatal outcome within three to six months based on best available clinical judgment;
b. no further effective treatment exists for the disease;
c. the patient has one or more relatives available as potential donors of bone marrow or hematopoietic cells;
d. the patient and family have appropriate motivation for the transplant.

We would appreciate an opportunity to evaluate such patients for inclusion in the program. Evaluation of the patient would involve a visit to the outpatient department at the Clinical Center and the obtaining of blood from the patient and his relatives for histocompatibility testing which will be done in the Immunology Branch laboratories. If the patient is hospitalized and too ill to come to the Clinical Center, one of our staff will visit the hospital and arrange to get the requisite blood samples. Patients who qualify for hematopoietic cell transplantation will be admitted to the National Institutes of Health Clinical Center.

If you know of any such patients or if such patients come to your attention in the future, you may call Dr. G. N. Rogentine at AC 301, 496-2454 or Dr. John L. Fahey at AC 301, 496-5461.

Annual Meeting of the Medical and Chirurgical Faculty

APRIL 1, 2, 3, 1970

The Alcazar, Baltimore

An Arts and Hobby Exhibit will be held during the 172nd Annual Meeting of the Medical and Chirurgical Faculty. Physicians, their wives and families are asked to help make this exhibit an outstanding one with many interests on display. Anything made by the exhibitor is eligible. Entries will be accepted until all exhibit space is allotted. Please have exhibits framed or mounted.

Entries should be delivered to The Alcazar, Cathedral and Madison Streets, Baltimore, between 9:00 AM and 4:30 PM on Tuesday, March 31. They must be removed on Friday, April 3, between 1:30 and 4:30 PM. The Faculty cannot carry insurance on your exhibit, but utmost care will be taken of it. There will be a watchman on duty when the meeting is not in session. Probably the exhibitors' personal policies will cover the exhibit.

Certificates will be awarded to the prize-winning exhibits. The names of exhibitors received by February 1, 1970, will be listed in the printed Annual Meeting program. However, all entries should be submitted as early as possible.

Committee for Arts and Hobby Exhibits:

Mrs. Charles H. Williams, *Chairman*
Mrs. George H. Yeager, *Chairman, Judging*
Mrs. Kurt Lederer
Mrs. Marvin I. Mones

"All Interns are Alike"

It stands to reason. They all go through the same training; they all have to pass the same tests; they all have to measure up to the same standards; they all are underpaid, too. Therefore, all interns are alike.

That's utter nonsense, of course. But it's no more nonsensical than what some people say about aspirin. Namely: since all aspirin is at least supposed to come up to certain required standards, then all aspirin tablets must be alike.

Bayer's standards are far more demanding. In fact, there are at least *nine specific differences* involving purity, potency and speed of tablet disintegration. These Bayer® standards result in significant product benefits including gentleness to the stomach, and product stability that enables Bayer tablets to *stay* strong and gentle until they are taken.

So next time you hear someone say that all aspirin tablets are alike, you can say, with confidence, that it just isn't so.

You might also say that all interns aren't alike, either.

Mild ulcerative colitis may be triggered here...

In mild ulcerative colitis, a number of factors can precipitate an attack: for instance, dietary indiscretion, such as eating raw foods, or emotional overreaction, such as that aroused by financial difficulties. No matter what causes the patient's sensitive colon to "act up," he soon suffers from acute discomfort...and often, from anxiety and apprehension as well. Such patients frequently respond well to adjunctive dual-action Librax® therapy.

Librax combines, in a single convenient capsule, the well-known antianxiety effect of Librium® (chlordiazepoxide HCl) and the dependable anticholinergic/antispasmodic effect of Quarzan® (clidinium Br). Therefore, as Librax helps to relieve the patient's excessive anxiety and reduce his overreaction to stress, it also, at the same time, helps to control hypersecretion and hypermotility, thus relieving spasm and abdominal discomfort.

With Librax, the dosage schedule is simple: 1 or 2 capsules, t.i.d. or q.i.d., will in most cases bring the patient significant relief of both the emotional and physical elements that contribute to his psychovisceral disorder.

Before prescribing, please consult complete product information, a summary of which follows.

INDICATIONS: Indicated as adjunctive therapy to control emotional and somatic factors in gastrointestinal disorders.

CONTRAINDICATIONS: Patients with glaucoma; prostatic hypertrophy and benign bladder neck obstruction; known hypersensitivity to chlordiazepoxide HCl and/or clidinium bromide.

WARNINGS: Caution patients about possible combined effects with alcohol and other C depressants. As with all CNS-acting drugs, c tion patients against hazardous occupations quiring complete mental alertness (*e.g.*, operat machinery, driving). Though physical and p chological dependence have rarely been repor on recommended doses, use caution in ministering Librium (chlordiazepoxide hyd chloride) to known addiction-prone individu or those who might increase dosage; withdraw symptoms (including convulsions), followi discontinuation of the drug and similar to th seen with barbiturates, have been reported. U of any drug in pregnancy, lactation, or in wom of childbearing age requires that its potent benefits be weighed against its possible hazar As with all anticholinergic drugs, an inhibiti effect on lactation may occur.

PRECAUTIONS: In elderly and debilitate limit dosage to smallest effective amount to p clude development of ataxia, oversedation confusion (not more than two capsules per d initially; increase gradually as needed and tol

or here.

Though generally not recommended, if ination therapy with other psychotropics ees indicated, carefully consider individual harmacologic effects, particularly in use of po- erating drugs such as MAO inhibitors and hothiazines. Observe usual precautions in rence of impaired renal or hepatic function. Paradoxical reactions (*e.g.*, excitement, stimula- ion and acute rage) have been reported in psy- hotic patients. Employ usual precautions in reatment of anxiety states with evidence of im- ending depression; suicidal tendencies may be present and protective measures necessary. Vari- able effects on blood coagulation have been reported very rarely in patients receiving the ug and oral anticoagulants; causal relation- ship has not been established clinically.

ADVERSE REACTIONS: No side effects or manifestations not seen with either compound ave been reported with Librax. When hlordiazepoxide hydrochloride is used alone, drowsiness, ataxia and confusion may occur, especially in the elderly and debilitated. These are reversible in most instances by proper dosage adjustment, but are also occasionally observed at the lower dosage ranges. In a few instances syncope has been reported. Also encountered are isolated instances of skin eruptions, edema, minor menstrual irregularities, nausea and constipation, extrapyramidal symptoms, increased and decreased libido—all infrequent and generally controlled with dosage reduction; changes in EEG patterns (low-voltage fast activity) may appear during and after treatment; blood dyscrasias (including agranulocytosis), jaundice and hepatic dysfunction have been reported occasionally with chlordiazepoxide hydrochloride, making periodic blood counts and liver-function tests advisable during protracted therapy. Adverse effects reported with Librax are typical of anticholinergic agents, *i.e.*, dryness of mouth, blurring of vision, urinary hesitancy and constipation. Constipation has occurred most often when Librax therapy is combined with other spasmolytics and/or low residue diet.

two good reasons for prescribing LIBRAX®

Each capsule contains 5 mg chlordiazepoxide HCl and 2.5 mg clidinium Br.

ROCHE LABORATORIES
Division of Hoffmann-La Roche Inc.
Nutley, New Jersey 07110

No place for beginners

Terramycin®
(oxytetracycline)

An infection of rapid onset requiring prompt attention. Teenage girl with chills, fever, abdominal pain, backache and nausea. Frequent and urgent urination with burning. On examination—tenderness over kidney. Blood count and urinalysis confirm the diagnosis: acute pyelonephritis. Treatment is initiated with Terramycin. Within a few days of follow-up therapy, the patient is markedly improved. The pretreatment urine culture shows a strain of *E. coli* highly susceptible to Terramycin.

Experience has shown that Terramycin offers special advantages in treating urinary tract infections when strains of causative bacteria are susceptible. Broad-spectrum coverage unaffected by penicillinase. Effective tissue levels to help reach foci of infection in renal parenchyma. High urine levels—excreted by kidney in *active* form.

With Terramycin, you have the assurance that comes with choosing an agent physicians have depended on for over 18 years. In difficult as well as routine cases, when tests reveal susceptible organisms, consider Terramycin. One of the world's most widely used broad-spectrums.

Contraindicated: In individuals hypersensitive to oxytetracycline.

Warnings: Reduce usual oral dosage and consider antibiotic serum level determinations in patients with impaired renal function.

Use of oxytetracycline during the last trimester of pregnancy, neonatal period and early childhood may cause discoloration of developing teeth. This effect occurs mostly during long-term use of the drug, but it has also been observed in usual short-treatment courses.

During treatment with tetracyclines, individuals susceptible to photodynamic reactions should avoid direct sunlight; if such reactions occur, discontinue therapy.

Note: With oxytetracycline, phototoxicity is unknown and photoallergy very rare.

Precautions: Use of broad-spectrum antibiotics occasionally may result in overgrowth of nonsusceptible organisms. Where such infections occur, discontinue oxytetracycline and institute specific therapy. Increased intracranial pressure in infants is a possibility. Symptoms disappear upon discontinuation of therapy.

Adverse Reactions: Nausea, diarrhea, glossitis, stomatitis, proctitis, vaginitis and dermatitis, as well as reactions of an allergic nature, may occur but are rare.

Supply:* Terramycin Capsules: oxytetracycline HCl, 250 mg. and 125 mg. Terramycin Syrup: calcium oxytetracycline, 125 mg. per 5 cc. Terramycin Pediatric Drops: calcium oxytetracycline, 100 mg. per cc.

*All potencies listed are in terms of the standard, oxytetracycline.

More detailed professional information available on request.

172nd ANNUAL MEETING

Medical and Chirurgical Faculty of the State of Maryland

APRIL 1, 2, 3, 1970

The scientific sessions of the 1970 Annual Meeting will be held at the Alcazar in Baltimore. Scheduled to present papers are

Daniel M. Gordon, MD
Associate Professor of Ophthalmology
Cornell University Medical College
New York

George James, MD, Dean
Mount Sinai School of Medicine
New York

Roy W. Menninger, MD, President
The Menninger Foundation
Topeka, Kansas

William H. Moretz, MD, Chairman
Department of Surgery
Medical College of Georgia

John Rock, MD
Clinical Professor Emeritus of Gynecology
Harvard Medical School
Director, Rock Reproductive Clinic, Inc.
Cambridge, Massachusetts

Felix Wroblewski, MD
Associate Professor of Clinical Medicine
Cornell University Medical College
New York

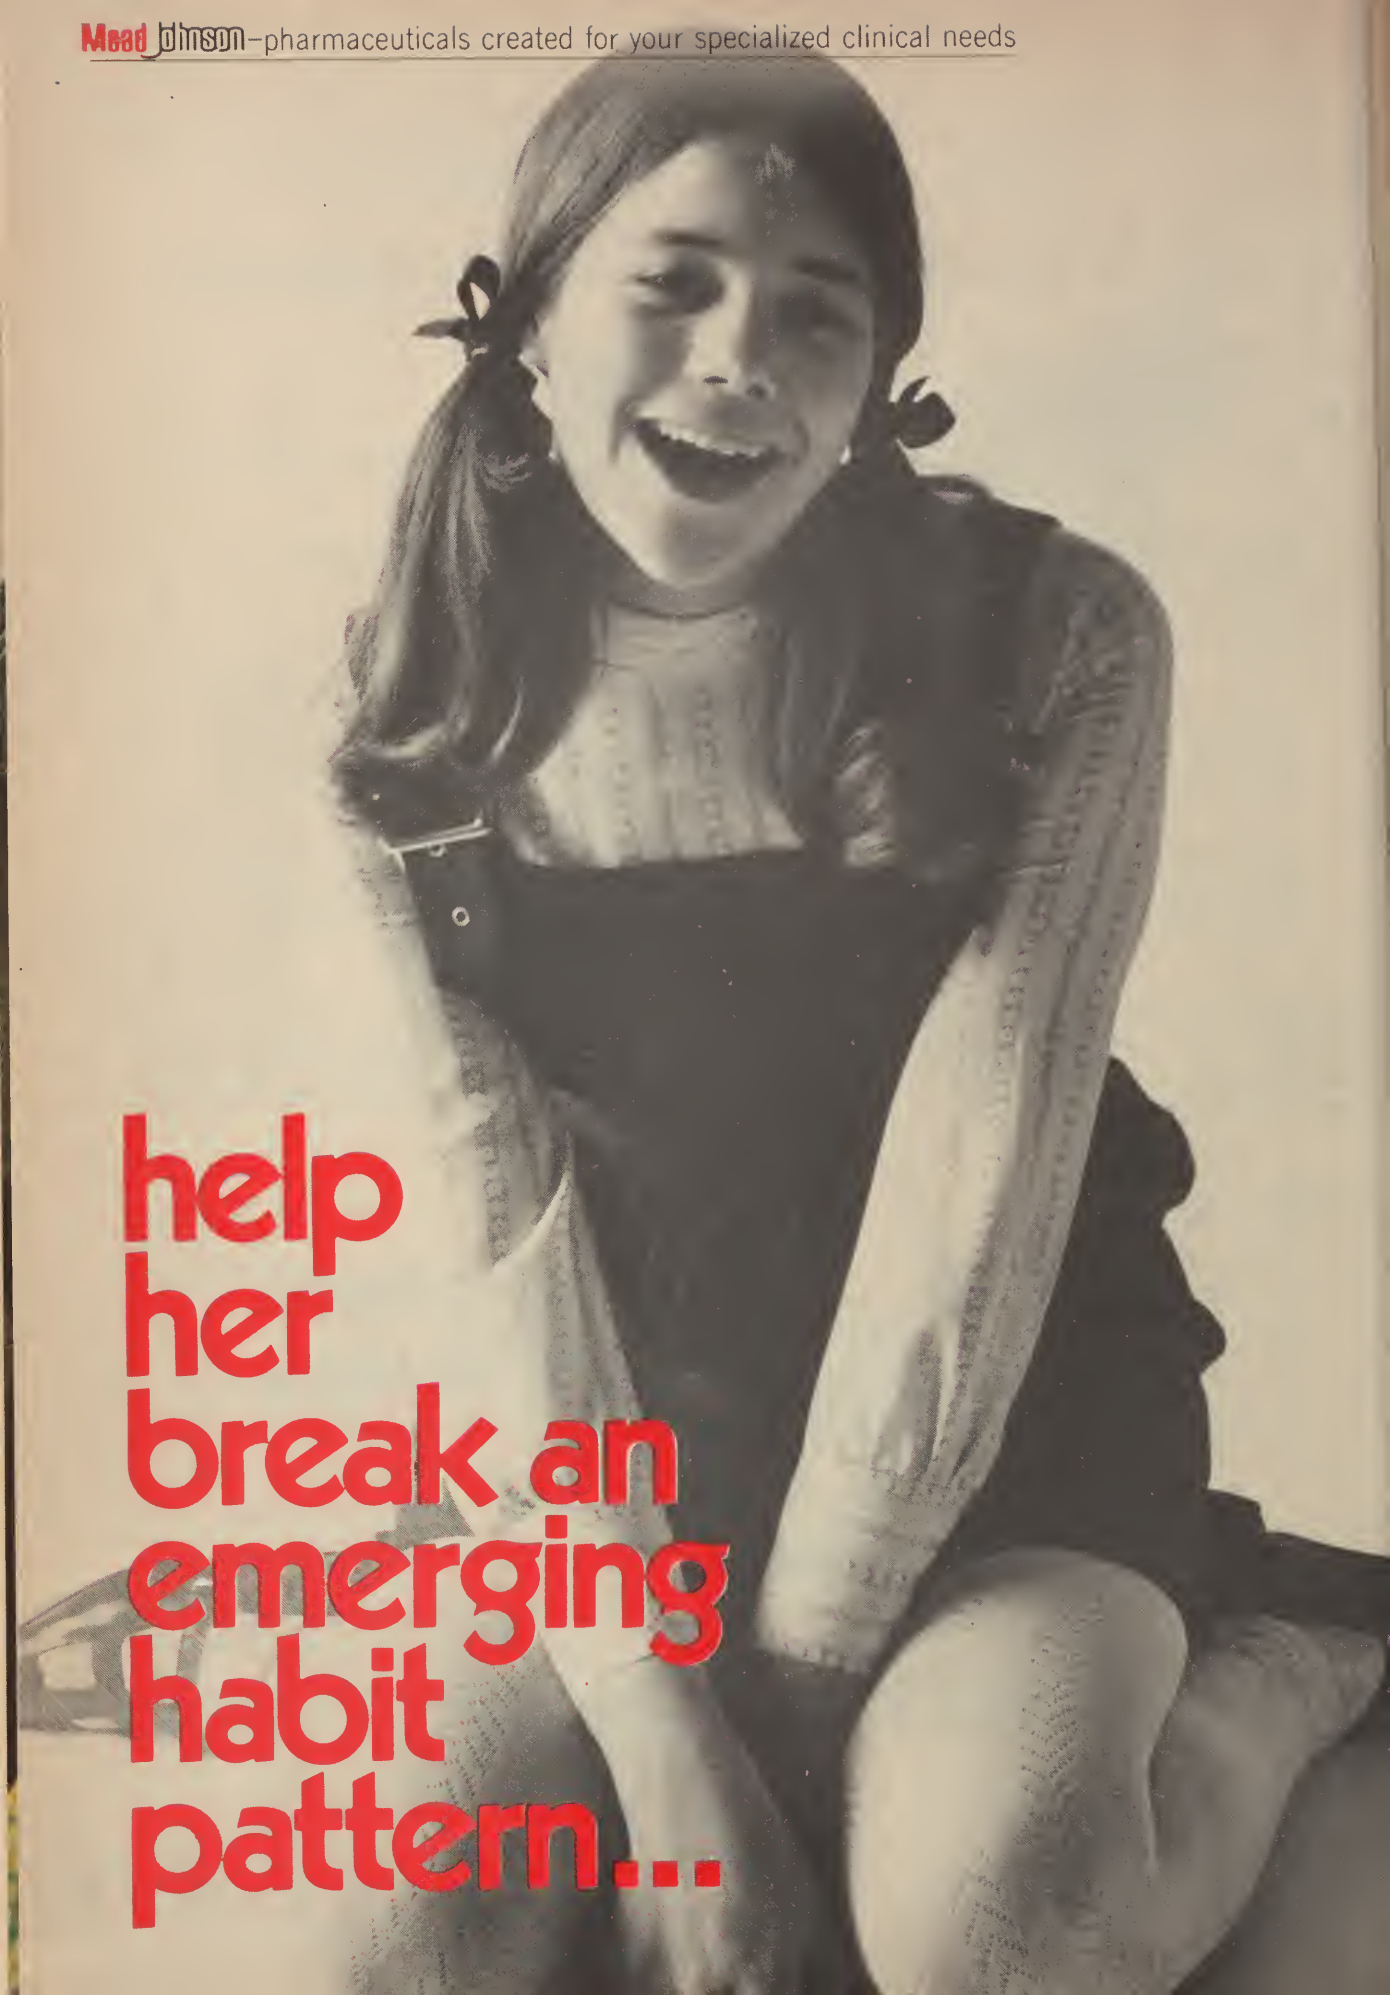
Medical Grand Rounds will be presented by A. McGehee Harvey, MD, and staff members of the Department of Medicine of The Johns Hopkins University. Surgical Grand Rounds will be presented by Robert W. Buxton, MD, and staff members of the Department of Surgery of the University of Maryland.

Other activities scheduled are

Annual Round-Table Luncheon, at the Belvedere Hotel, will include luncheon meetings of the alumni associations of several medical schools, and informal scientific discussions

Hospitality Night—this proved so very popular at the 1969 Meeting, that it will be repeated in 1970 at the Belvedere Hotel—vocal and instrumental entertainment will be provided

Annual Presidential Reception and Banquet—at the Blue Crest North, well known for its delectable cuisine, hors d'oeuvres, and cocktails—in a delightful atmosphere with professional entertainment, and dancing for everyone to the music of Rivers Chambers' Orchestra



Arts and Hobby Exhibit—at the Alcazar—a chance for you to put your unusual talents on display (see page 19 for the application form)

Health Evaluation Tests—at the Alcazar—an easy way to get your semiannual checkup

Scientific and technical exhibits will be on display each day of Annual Meeting at the Alcazar—the exhibits constitute a symposium on therapeutic progress

Committee on Program and Arrangements
DeWitt E. DeLawter, MD, *Chairman*

Mead Johnson–pharmaceuticals created for your specialized clinical needs

help her break an emerging habit pattern...

GYNOREST®
(DYDROGESTERONE)

helps break the emerging habit pattern of nonorganic primary dysmenorrhea.

Early relief of primary dysmenorrhea in the adolescent may lessen its tendency to become a habit pattern "which is very difficult to interrupt."* Dydrogesterone proves to be "...an extremely satisfactory drug...the most conservative type of progestational agent..."* for relief of severe and incapacitating dysmenorrhea in adolescents.

Gynorest provides these distinct advantages

normal cycles usually undisturbed... no inhibition of ovulation...occasional breakthrough bleeding can usually be controlled by dosage adjustment

mild, infrequent side effects... withdrawal is seldom required

freedom from estrogenic and androgenic effects... progestational in action

Mead Johnson
LABORATORIES

ontraindications No serious untoward reactions to Gynorest have been reported and there are no known contraindications to its use. here have been no adverse effects observed clinically on the hepatic, renal, or hemopoietic systems. **Precautions** Before hormonal treatment considered in patients with excessive or abnormal uterine bleeding, the cause of such bleeding should be determined on an individual asis. Appropriate procedures should be used to determine whether an organic lesion or systemic disease is the cause of the bleeding. lthough never reported for Gynorest, it should be borne in mind that other progestogens have been observed to cause fluid retention hich on occasion may result in exacerbated attacks of epilepsy, migraine or asthma. **Adverse Reactions** Gynorest appears to be nontoxic. ild gastrointestinal complaints such as nausea, diarrhea, or constipation have rarely been reported, but have not necessitated withdrawal the drug. There have been no endocrinologic side effects such as masculinization of a female fetus, virilization of a female patient, or y corticosteroid activity reported from the use of Gynorest. Breakthrough bleeding can usually be controlled by increasing the dosage by giving the drug in smaller doses at more frequent intervals to maintain a more constant blood level. **Dosage and Administration** Complete details are included in the package insert. Additional information may be obtained from Mead Johnson Laboratories. **Supplied** 10 mg. hite Scored Tablets, bottles of 100, or 5 mg. White Scored Tablets, bottles of 50.

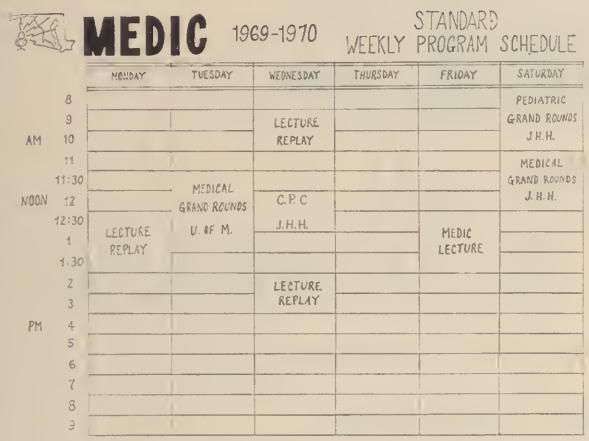
STERILIZATION, PREP AND ISOLATION TECHNIQUES



John J. White, MD
Assistant Professor of Pediatric Surgery
The Johns Hopkins University School of Medicine

It is becoming apparent that infections are more frequently due to organisms endogenous to the patient himself than to contamination from his surroundings. Current aseptic methods range from those based on established evidence, through those that lack good evidence but appear rational, to those that seem to be based on ritual. Prepping solutions and techniques, isolation and protection systems and sterilization will be discussed.

ANNOUNCING THAT

The GUNDRY SANITARIUM

*Established 1900 * * * Continually Growing and Modernizing*

(1) . . . HAS BEEN ACCREDITED FOR 3 YEARS BY THE JOINT COMMISSION ON ACCREDITATION OF HOSPITALS

(2) . . . HAS BEEN CERTIFIED AS A PARTICIPATING HOSPITAL FOR HEALTH INSURANCE UNDER SOCIAL SECURITY (MEDICARE)

The GUNDRY SANITARIUM, a complete psychiatric community, includes a 33-bed Inpatient Hospital for female patients, a Night Hospital for female patients, a Day Hospital for male and female patients, and an Outpatient Department for patients of all ages.

Wouldn't you feel satisfied knowing that your patient is receiving care in a hospital with all these advantages:

- **Treatment is based upon intensive individual and group psychotherapy combined with drug therapy when indicated**
- **All the Doctors are highly trained Psychiatrists**
- **Highly trained Nursing and Medical staff is available 24 hours a day**
- **Environment is warm and homelike.**
- **Protected against fire by approved sprinkler system**
- **Competent medical consultation in all fields is available**
- **Close liaison with the referring physician is maintained**
- **All forms of occupational and recreational activities are offered**
- **Follow-up care in the Day, Night or Outpatient Service**
- **RATES are reasonable; outpatient fees on a sliding scale.**

MRS. FRANK A. FARAINO, EDITOR

The *Slant* on Mini Workshops

Mini workshops were a new feature of the 1969 Fall Conference of the Woman's Auxiliary to the American Medical Association, which was attended by Mrs. Wallace Sadowsky, president, and Mrs. Raymond Yow, president-elect. The 26th annual conference of state presidents, presidents-elect, national officers and chairmen was held at Chicago's Drake Hotel, October 5-8.

The conference opened Sunday evening with four regional dinners chaired by Mrs. G. Prentiss Lee, Portland, Oregon, first vice president. Our Eastern Region Dinner was presided over by our regional Vice President, Mrs. Herbert J. Ulrich from Snyder, N. Y. This was a get-acquainted and renew-old-friendships meeting plus a bird's eye view of what to expect at the conference.

Mrs. John M. Chenault, president, opened the Monday, October 6 session. Gerald D. Dorman, MD, President of the AMA, delivered the keynote address. Dr. Dorman congratulated the auxiliary on its anti-violence campaign and encouraged everyone to continue the auxiliary involvement with youth. He reminded us of the AMA and auxiliary's main objective—"best health care for all the people."

Headlining the morning program was Howard A. Schneider, MD, Head of the Experimental Medical Ecology Department of AMA's Institute for Biomedical Research. Dr. Schneider referred to the auxiliary as the "Institute's staunchest and greatest support."

Next, A. Brooks Parker, Jr., director of Tennessee Health Careers, offered a dynamic health careers presentation especially designed to reach the "now generation." Mr. Parker talked about the successful health careers campaign being conducted throughout Tennessee and showed a slide presentation called "The Health Teams," which is being used as a part of the recruiting program. His informative talk made us want to get involved in all sorts of career programs right now!

The morning program concluded with discussions by Mrs. Carl Welch, president, and Mrs. G. Edward Kappler, president-elect, of the Woman's Auxiliary to the Student American Medical Association.

Ernest B. Howard, MD, AMA executive vice president, was the guest speaker at the Monday luncheon. Dr. Howard commented on the quantity and quality of health care today. He added that the AMA's major need is to identify itself as a national group with concerns of the nation in health care and "do something about it."

The afternoon session centered around "The Auxiliary at Work in the Community." Eight auxiliary women participated in a skit titled "How to Present a Package Program," which offered some practical applications of the auxiliary's package program on alcoholism. Our own Mrs. Wallace Sadowsky was one of the eight actresses. The program concluded with the film, "A New Look at the Old Sauce," from the Texas Commission on Alcoholism.

The Monday session ended with a dinner sponsored by the AMA Public Affairs Division and The American Medical Political Action Committee. Mrs. Frank Gastineau, secretary-treasurer of AMPAC, introduced the guest speaker, the Hon. Robert Packwood, (R), U.S. Senator from Oregon.

Senator Packwood discussed "You, Too, Can Be a Leader," focusing his presentation on women in politics. He referred to the qualities of leadership which can be learned or taught as purpose, integrity, tolerance, discipline, and imagination. However, he added there is a sixth quality called zeal which cannot be learned or taught. "If you master zeal," Packwood remarked, "you will have all the qualities of good leadership."

The Tuesday session began with mini workshops. The group was divided into five sections according to size of state membership, while five program extension committee chairmen rotated from room to room and presented ideas for implementation on the state level. The workshops held were Community Health, International Health, Mental Health, and Safety-Disaster Preparedness. The Community Health Chairman, Mrs. Linus Hewitt, told of rural as well as urban health needs, pointed out similarities, and showed how health careers recruitment, especially in rural health is so much a part of community health. We were also told that January has been designated blood donor month.

Mrs. Jacob Ripp, our Eastern Regional Director

of International Health, told of the continuing need for books and teaching material, as well as medical supplies and clothing. Different agencies that handle this and ways of shipping were also discussed. We were shown items that are made of leftovers and throw aways. A sleeping mat crocheted from bread wrappers was very unique and seemed very practical.

Mrs. Willard C. Serivner, chairman of Home Centered Health Care, explained the three different areas of home center care: homemaker services, meal service, and volunteer friendly visitors. The three areas require enthusiastic volunteers from all service organizations. The Pennsylvania Auxiliary works with home center care which is funded by assorted agencies of the state. We were given a short description of the agency and its work by our Eastern Regional Director, Mrs. M. A. Bergnes of Norristown, Pa. Mrs. J. J. Levin from Wisconsin told of meal service as it worked in her home town and also said how appreciative shut ins are of the Volunteer Friendly Visitors. She reminded us of a very important hint that we tend to forget, don't become discouraged, these projects are a long process of research, hope and recruitment.

The Mental Health Chairman, Mrs. Jonathan Williams, told us the stress was still on drugs and alcohol. We were advised that panel programs work well on drug abuse and we saw several interesting pamphlets on glue sniffing, LSD, amphetamines, and barbiturates.

Mrs. John Halseth, Safety-Disaster Preparedness Chairman, announced that Highway Safety will be emphasized this year. We were pleased to learn that the changes in state law being stressed concerning an implied consent law has been accomplished in Maryland. If you've renewed your driver's license recently you have discovered that you must sign a statement on the application giving your agreement to obey the implied consent law. We also have compulsory driver education in the high schools, and defensive driving courses are offered throughout the state by the state troopers. If you haven't taken advantage of this course you should—it really might mean the difference between "safe or sorry."

Following the "Table Talk" luncheon program, Donald L. Taylor, executive vice president of the Iowa Medical Society, recounted how "The Auxiliary Works With the Medical Society."

The afternoon concluded with a three-part program on "The Auxiliary Tells Its Story." Mrs. G. Prentiss Lee, membership committee chairman, Mrs. Sherman Arnold, and Mrs. Bernard Campbell discussed the auxiliary's contributions to its members. Mrs. Hartwell Dunn and Mrs. Josiah Fuller told of the auxiliary's work with other organizations while Mrs. J. Paul Sauvageot, communications committee chairman, Mrs. John M. Wagner, editor of *M.D.'s Wife,* and Mrs. Richard A. Sutter, editor of *Direct Line,* discussed the auxiliary's relationship to the public.

The Wednesday meeting began with a tour of AMA headquarters. The remainder of the morning was devoted to a film presentation in the AMA's 9th floor auditorium. Mrs. Paul E. Rauschenbach, chairman of the committee on children and youth, introduced the new film by the National Foundation called "More Than Love."

Rev. Paul B. McCleave, director of the AMA's Department of Medicine and Religion, presented "A Storm, A Strife," the new AMA medicine and religion film. Both of these films are excellent and I hope both can be used in Maryland.

Mrs. John Chenault gave a brief report on the action taken by the executive board at the morning meeting. It was unanimously decided to send a letter of condolence to Art Linkletter on the tragic loss of his daughter and offer him encouragement and support on his announced campaign against drugs.

The board also is recommending that members of WASAMA be asked to work with WAAMA on recruitment programs for health careers.

The meeting adjourned following the showing of the auxiliary's participation in closed circuit TV taped during the AMA annual convention in July, 1969, in which our own Show and Tell was seen.

We left the workshops motivated—now all we have to do is motivate everyone in Maryland.

ARTHUR E. COCCO, MD
Journal Representative

Baltimore City Medical Society

Meeting Minutes

Six of the Members of the Board of Directors of the Baltimore City Medical Society met at 1211 Cathedral St., Baltimore, Md., on Tuesday, October 14, 1969 at 4:30 PM for their monthly meeting.

The meeting was called to order by R.C.V. Robinson, MD, president. The minutes of the September 2, 1969 meeting were read and approved by the Board.

The first item on the agenda was a report by Robert B. Goldstein, MD, secretary, informing the Board that the minutes of the Board of Directors meetings of the Baltimore City Medical Society are presently in the process of being bound for preservation.

The next item on the agenda was the discussion of a letter addressed to Dr. Robinson from M. B. Levin, MD. Dr. Levin, in his letter, questions clarification of definitions of a legally constituted voting quorum. Dr. Levin offered several pertinent comments in his letter, pointing to specific deficits he believes are at present in existence. The comments offered by Dr. Levin provoked much discussion by the members of the Board and were finally referred to William Evans, Esq., Parliamentarian of the Baltimore City Medical Society, for further clarification and definition.

Dr. Robinson read a letter from Robert E. Farber, MD, Commissioner of Health, Baltimore City Health Department, announcing the recent availability of a new service through the Baltimore City Health Department. This project, known as the Geriatric Evaluation Service, is funded by a federal grant under Title III of the Older Americans Act, supplemented by a Community Mental Health Services grant from the State Department of Mental Hygiene. The goal of this program is to reduce admissions to state mental hospitals of city residents 65 years and older. This program is designed to provide medical, social, and psychiatric evaluation on elderly persons for whom mental hospital admission is pending and to assist relatives or agents in solving the problem of how best to care for aging, mentally impaired patients. It is hoped that the service can search out and use existing community resources in an attempt to prevent unnecessary hospitalization. Only those persons aged 65 or over, who are residents of Baltimore City, will be accepted. Prompt evaluation in the patient's home or present environment will follow. When a physician is known to be caring for the patient, project staff will be in touch with him before taking any further action. The project staff will appreciate the endorsement and cooperation of the Baltimore City Medical Society in this venture. The project director, Mrs. Mary Guth, will be glad to provide any further information necessary. She may be reached at the project offices located in the Good Samaritan Hospital, 5601 Loch Raven Boulevard, Baltimore, Md. 21212, telephone 323-2200, ext. 279 or 267. The Board of Directors greeted this announcement with enthusiasm and felt it indeed worthwhile and pledge the cooperation of the Society.

The next item on the agenda was a discussion of Medi-Card, Inc. This program is a medical finance service of a post-payment variety. This program is similar to that of Diner's Card, American Express, etc. and is soon to begin operation in the State of Maryland. The program was discussed in detail by the Board of Directors who chose to follow that stand presently assumed by the American Medical Association of neither approving nor disapproving of the Medi-Card concept.

Next, was a report from the Professional Relations Committee, concerning two society members against whom complaints have been filed. These cases were carefully evaluated and disposed of in appropriate manner.

The next item referred to the Board of Directors from the Professional Relations Committee was concerned with the administration of Methadone to narcotic addicts during their period of confinement to the City Jail. The Board of Directors felt that their support should be in agreement with that opinion offered by the governing board and responsible physician in charge of the present city penal program.

The discussion of utilization of extended care facilities, provoked by a letter from the Director of Medical Care Corps Agency of the Mutual of Omaha Corp., urging the Baltimore City Medical Society to sponsor a Utilization Committee for Nursing Homes, took place. After careful consideration, the Board of Directors felt that since this problem was of state-wide involvement, and since all nursing homes are licensed by the State Health Department, that agency should be responsible for utilization review.

The next item considered by the Board of Directors was the election of Harry B. Smith, MD, an active member of the Baltimore City Medical Society since 1944, to the status of Emeritus membership.

A request for support for the Tuberculosis Control Program in Baltimore City, on behalf of its effort to gain continued support of a federal grant was submitted. The Board agreed to continue its endorsement of this program.

Other new business included a discussion of a tentative buffet dinner in association with a future meeting of the Baltimore City Medical Society, the Board agreed that this possibility was worthy of further consideration and subsequent finalization of plans will be pursued.

The meeting was adjourned at 6:30 PM.

In Cystitis...Azo Gantanol® focuses analgesic-antibacterial activity where it counts

The mucosa: specific analgesia usually within 30 minutes

Azo (phenazopyridine HCl) effects specific mucosal analgesia, relieving the dysuria, discomfort and burning which are virtually always a part of acute urinary tract infections.

Interstitial fluids: ready diffusion of antibacterial

Gantanol (sulfamethoxazole) is readily diffused into interstitial fluids to provide efficient antibacterial activity at foci of infection. This distribution, plus continuous antibacterial levels in blood and urine, has afforded effectiveness in the majority of infections in which it has been used.

Blood and urine: therapeutic antibacterial levels within 2 hours for up to 12 hours

Gantanol (sulfamethoxazole) produces prompt and prolonged therapeutic levels, in both blood and urine, with convenient *b.i.d.* dosage. Clinical response is usually obtained within 24 to 48 hours. The wide antibacterial spectrum of Gantanol includes *E. coli* and a variety of other susceptible gram-negative and gram-positive pathogens in urinary tract infections.

Before prescribing, please consult complete product information, a summary of which follows:

Indications: Urinary tract infections with associated pain or discomfort when due to susceptible organisms; prophylactically in urologic surgery, catheterization and instrumentation.

Contraindicated in sulfonamide-sensitive patients, pregnant females at term, premature infants, newborn infants during the first three months of life, glomerular nephritis, severe hepatitis, uremia and pyelonephritis of pregnancy with gastrointestinal disturbances.

Warnings: Use only after critical appraisal in patients with liver damage, renal damage, urinary obstruction or blood dyscrasias. If toxic or hypersensitivity reactions or blood dyscrasias occur, discontinue therapy. In closely intermittent or prolonged therapy, blood counts and liver and kidney function tests should be performed.

Precautions: Observe usual sulfonamide therapy precautions including maintenance of an adequate fluid intake. Use with caution in patients with histories of allergies and/or asthma. Patients with impaired renal function should be followed closely since renal impairment may cause excessive drug accumulation. Occasional failures may occur due to resistant microorganisms. Not effective in virus and rickettsial infections.

Adverse Reactions: Headache, nausea, vomiting, urticaria, diarrhea, hepatitis, pancreatitis, blood dyscrasias, neuropathy, drug fever, skin rash, Stevens-Johnson syndrome, injection of the conjunctiva and sclera, petechiae, purpura, hematuria or crystalluria may occur, in which case the dosage should be decreased or the drug withdrawn.

Azo Gantanol®

(Each tablet contains 0.5 Gm sulfamethoxazole and 100 mg phenazopyridine HCl.)

Roniacol® Timespan®
(nicotinyl alcohol tartrate)

Because peripheral vasodilatio is needed now... and must often be continued

Roniacol Timespan (nicotinyl alcohol tartrate) can make a significant contribution to effective treatment of peripheral vascular disorders. It is directed specifically toward improvement of peripheral blood flow, relief of ischemic symptoms, and the long-term management of these conditions.

Specific pharmacologic action—Roniacol (nicotinyl alcohol) acts selectively by relaxing smooth muscle of peripheral blood vessels. Onset of action is smooth and gradual, rarely causing severe flushing.

Relative freedom from side effects—Side effects that may occur occasionally with Roniacol seldom require discontinuation of therapy

Prolonged, continuous drug release—Pro- s longed peripheral vasodilation is provided sustained-release Roniacol Timespan (nicc alcohol tartrate) Tablets. Part of the drug b comes available immediately, the remaind continuously over a period of up to 12 hou and dilation of constricted peripheral vess usually maintained. Thus, with a single dos medication, patients can enjoy the benefit increased peripheral blood flow in ischem extremities for up to 12 hours.

nooth peripheral vasodilation from initial osage...extended with inple, well-tolerated, b.i.d. dosage

e rolonged action of Roniacol Timespan c:inyl alcohol tartrate) together with its benefits offer a therapeutically practical ure in the long-term management of ineral vascular disease–advantages cially important for older patients.

ce prescribing, please consult complete uct information, a summary of which lows:

lations: Conditions associated with ient circulation; e.g., peripheral vascular e:e, vascular spasm, varicose ulcers, cbital ulcers, chilblains, Meniere's syn- e and vertigo.

Caution: Roche Laboratories endorses caution in the administration of any therapeutic agent to pregnant patients.

Side Effects: Transient flushing, gastric disturbances, minor skin rashes and allergies may occur in some patients, seldom requiring discontinuation of the drug.

Dosage: 1 or 2 Timespan Tablets—150 mg nicotinyl alcohol in the form of the tartrate salt—bottles of 50 and 500.

Art is a conception of peripheral vasodilation.

A once-popular treatment for back pains was to have the seventh son of a seventh son stand or walk on the patient's back.

The pain of earache was allegedly relie by holding a hot roasted onion to the ear

For headache, a sovereign remedy was to wear a snakeskin round one's head.

A realistic approach to pain relief

'Empirin'®

Compound with Codeine Phosphate gr. 1/2 No. 3

Each tablet contains:
Codeine Phosphate gr. 1/2 (Warning—May be habit forming), Phenacetin gr. 2 1/2, Aspirin gr. 3 1/2, Caffeine gr. 1/2.

keeps the promise of pain relief

'B.W. & Co.' narcotic products are Class "B", and as such are available on oral prescription, where State law permits.

NOW
A NEW CONCEPT
in
BOOKKEEPING
and
TAX SERVICES

This Service, used by hundreds of Professional men in Maryland, is proof that we save time and money for you.

WHAT YOU DO —

Maintain a checkbook—one which we have especially designed for Physicians

WHAT WE DO —

—we prepare MONTHLY STATEMENTS of Income and Expense

—we prepare QUARTERLY AND FINAL PAYROLL RETURNS

—we prepare and adjust QUARTERLY DECLARATIONS OF ESTIMATED TAXES

—we prepare STATE AND FEDERAL INCOME TAXES, ready for signature

—we prepare a CONFIDENTIAL COST ANALYSIS

—we relieve you of the burden of BOOKKEEPING AND TAXES and leave you free to practice medicine.

THE MONTH IN WASHINGTON

An American Medical Association spokesman outlined the **AMA's voluntary national health insurance plan, "Medicredit,"** for consideration by the House Ways and Means Committee.

Russell B. Roth, MD, speaker of the AMA's House of Delegates, and a practicing physician in Erie, Pa., said the plan which would be financed in part by federal income tax credits, is flexible and would assure all Americans —no matter how limited their financial resources—of adequate health care protection.

"Representing this country's physicians as we do," Dr. Roth said, "the AMA is on record in its belief that it is the basic right of every citizen to have available to him good health care.

"Today we want to put before this committee a plan which is universal in scope, voluntary in nature, and realistic in terms of total program cost."

Dr. Roth estimated the program would cost the federal government $8 billion to $9 billion a year, but about $3 billion a year of that would be offset by liquidation of the medicaid program. Medicare would continue.

"For those in low-income categories, this protection is theirs without expense or contribution on their part," Dr. Roth stated. "For those with moderate and higher levels of income, Medicredit provides a system of cash incentives to enable them to protect themselves against major health care costs. . . .

"Our proposal is the result of years of careful study of our existing mechanisms for delivering and financing health care, coupled with our close study of the federal government's ability to fund a universal health insurance program. . . .

"It would give to persons who have purchased comprehensive health insurance the option of receiving a tax credit on their annual federal income tax return, a credit based on their tax liability. That is, a taxpayer could take as a credit against the amount of income tax owed to the federal government, all or part of their personal cost for comprehensive health coverage. Persons or families with a lower tax liability (usually reflecting lower income or more dependents and allowable expenses) would receive a greater tax credit. And those families in the lower 30% income range, would, without cost to them, receive a certificate enabling them to purchase health coverage from qualified groups or plans."

The AMA plan calls for establishment of a "Health Insurance Advisory Board" to create Medicredit guidelines. It would be chaired by the Secretary of Health, Education, and Welfare and include the Commissioner of Internal Revenue and public members. It would review the effectiveness of the program and file annual reports with the President and the Congress.

Basic medical benefits of Medicredit would include:

—Up to 60 days of inpatient hospital services, including maternity services;

—All emergency room and outpatient services provided in the hospital;

—All physicians' services, whether performed in the hospital, home, office or elsewhere.

Supplemental benefits to basic coverage would also be eligible for tax credits.

Dr. Roth stressed the importance of utilizing private insurance carriers, thus taking maximum advantage of private sector competition to help hold costs down.

Rep. Durward G. Hall, MD (R., Mo.), a former member of the AMA House of Delegates, submitted to the committee another national health insurance plan. The first part of his two-part plan calls for the federal government to furnish persons eligible for medicaid with health insurance certificates covering certain specified basic health protection. The states would have the responsibility for the balance of health care for an eligible individual after his basic coverage had been exhausted. Thus, the Hall plan would replace medicaid.

The second part of the Hall proposal calls for the federal government helping, in cases of catastrophic illness, those persons who can afford normal health care insurance only.

Other national health insurance plans are being sponsored by Walter Reuther, head of the automobile workers' union; the AFL-CIO; Sen. Jacob K. Javits (R., N.Y.), and Gov. Nelson Rockefeller of New York. Indications are that the committee will not give serious consideration to such legislation before next year, at the earliest. However, it appears probable that the issue will come to a vote in Congress before the 1972 elections.

* * *

The AMA also submitted to the Ways and Means Committee a statement on the Nixon Administration's **"Health Cost Effectiveness Amendments of 1969" legislation.**

The AMA commended the Department of Health, Education and Welfare for its efforts to curtail the rising costs of medicaid and medicare, but said that the Association believes "there are better and more appropriate means of meeting this problem."

As for the provision prohibiting payment to physicians who have committed fraud, overcharged or otherwise abused the medicare program, the AMA said:

"It should be kept in mind that there presently exist remedies to reach the cases of abuse which may exist—certainly the cases of extreme abuses which HEW has asserted these proposed penalties are intended to reach. While it is true that the law does not provide authority to disqualify physicians as to prospective participation, a carrier may reject or review a physician's claims on an individual basis as each claim is presented.

"The apparent concern of the Congress regarding alleged abuses and increasing program costs may require some changes in the administration of federally financed health care programs. However, the proposed amendments appear to introduce more severe remedies than the problems require."

As for the provision that utilization review committees pass retroactively on the medical necessity of admission of medicare patients to hospitals, the AMA said:

"At the present time a utilization review plan of an institution must provide for review—on a sample basis or other basis—of admissions, duration of stays, and services furnished, and also must provide for review of each case of extended stay, and determine the medical necessity of further stay. The law provides for three additional days of benefit payments after a negative finding and notification.

"Where a finding has been made that the admission was unnecessary, no payment would be made. Thus the denial of payment would be retroactive to the date of admission. The three-day grace period is removed from existing law.

"The AMA previously objected to initial certification of the need for admission to a hospital, and this initial certification requirement was removed from the law. Under this bill, the utilization review committee would be required to review the attending physician's judgment as to the need for hospitalization. The present requirement of the committee under medicare is to review extended stay cases to determine the need for further stay; thus it does not review a great number of cases of hospitalization where the patient is discharged earlier. Requiring committees to review all cases of hospitalization would impose a tremendous burden on the committee, and create additional heavy demands on physicians' productive man hours.

"An adverse finding by a committee would subject the patient to individual liability for hospital charges. As a result, this provision could act as a restraint on patients receiving care, particularly in those cases where a physician recognizes the possibility of differing medical judgments concerning the admission."

Early in November, the Senate Subcommittee on Constitutional Rights heard **Mildred Mitchell-Bateman, MD, and John Donnelly, MD, members of the AMA's Council on Mental Health, present AMA information on the constitutional rights of the mentally ill.**

Dr. Bateman outlined many of the problems in preserving the civil rights of the mentally ill. Dr. Donnelly concluded the association's joint presentation with the statement, "The rationale for commitment is protection of the individual from himself, and protection of society from the individual. The consequences of commitment is, or should be, treatment—treatment of the mental illness which caused the individual to be harmful to himself and to others. . . . No man whose illness does not constitute a distinct threat to his welfare or to that of others should be forced to undergo treatment."

Appearing before the Select Subcommittee on Labor of the House Education and Labor

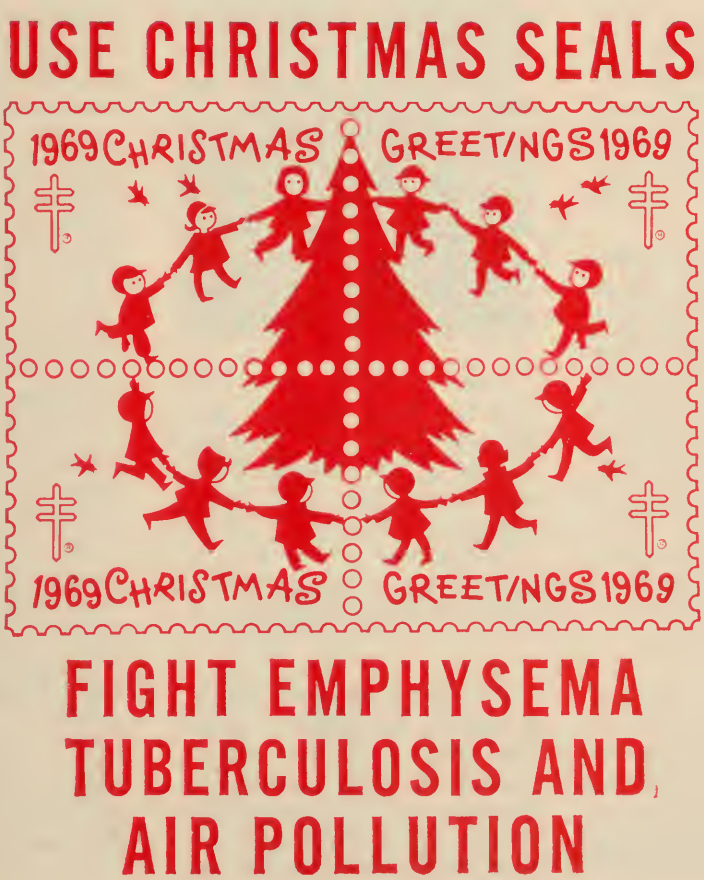
It's not too soon to make reservations for
Med-Chi's Annual Meeting
April 1, 2, 3, 1970
Call or write the Faculty office for information

Committee, **R. Lomax Wells, MD, a member of the AMA's Council on Occupational Health, offered the association's support of the Administration's Occupational Safety and Health Act, H.R. 13373.**

Dr. Wells, speaking for the AMA, supported the creation of the Presidentially appointed five-man National Occupational Safety and Health Board whose function it would be to set national occupational safety and health standards, and to create a National Advisory Committee which would permit active participation by the Department of HEW.

He also stated the AMA's support for increased federal funding of state occupational safety and health programs for the purposes of upgrading state programs, so that they might eventually take over the responsibility for the promulgation and enforcement of state standards in place of the federal program.

* * *



President Nixon, in his message to Congress on Consumer Affairs and Protection, stressed the need for "stronger efforts in the field of food and drug safety." He suggested a re-evaluation of the Food and Drug Administration, and a review of the products on the "generally regarded as safe" list.

In speaking of drugs, the President said that he would ". . . recommend that the Congress take action which would make possible, for the first time, the rapid identification of drugs and drug containers in a time of personal emergency." (The AMA has supported adequate labelling of prescription containers and has drafted a bill to that effect.)

The President went on to say, "Another important medical safety problem concerns medical devices—equipment ranging from contact lenses and hearing aids to artificial valves which are implanted in the body. Certain minimum standards should be established for such devices; the government should be given additional authority to require premarketing clearance in certain cases. The scope and nature of any legislation in this area must be carefully considered, and the Department of HEW is undertaking a thorough study of medical device legislation. I will receive the results of that study early in 1970. . . ."

As yet, no legislation implementing the President's recommendations has been introduced.

MEDICAL NEWS

Ernst Schmidhofer, MD, is now associated with the Ohio Department of Mental Hygiene and Correction, Division of Psychiatric Criminology, Chillicothe, Ohio as Assistant Commissioner, Research and Program Development.

* * *

George N. Austin, MD, has moved his orthopaedic practice to Gottsche Rehabilitation Center, P. O. Box 790, Thermopolis, Wyoming 82443.

* * *

Charmian Elkes, MD, psychiatrist, announces the removal of her office to Columbia Hospital and Clinics, Columbia, Maryland 21043.

* * *

The offices of **Frank F. Schuster, MD,** and **Howard Moses, MD,** are now located at 819 Park Avenue, Baltimore, Maryland 21201.

* * *

Frederick P. Pokrass, MD, has been named Superintendent of Springfield State Hospital. Making the appointment was **James E. Carson, MD,** Commissioner of the Department of Mental Hygiene.

Dr. Pokrass joined the staff of Springfield State Hospital in 1965 as Director of Psychiatric Community Services, and also served for three years as the hospital's clinical director. He has been serving as acting superintendent of the hospital since January 1, 1969. Dr. Pokrass received his BS degree from Cornell University and his medical training at the University of Maryland School of Medicine.

* * *

The newly appointed director of the department of nursing service at the University of Maryland Hospital is **Jean T. MacVicar.** The announcement was made jointly by **George H. Yeager, MD,** director of the hospital, and **Marion I. Murphy, MD,** dean of the University of Maryland School of Nursing, where Mrs. MacVicar is chairman of the graduate program in administration of nursing—a position she will continue to hold.

This kind of joint appointment —the administration of current nursing practice and the education of future nursing administrators within the same hospital —is unique in the country, and should help to unify the two programs which have previously been inappropriately divided.

* * *

Sponsored by the **Regional Medical Program for Maryland, Sinai Hospital** of Baltimore operates a comprehensive and team outpatient program for the rehabilitation of stroke patients, including physical and occupational therapy, speech and hearing therapy, vocational evaluation and counseling in the areas of social and emotional adjustment. Referrals are requested.

Further information is available by writing to: Stroke Program, Department of Rehabilitation Medicine, Sinai Hospital, Belvedere at Greenspring, Baltimore, Maryland 21215, or by calling the Stroke Program Office (301) 367-7800, Extension 8801.

* * *

A new handbook, *Home Care Programs in Arthritis,* is now available from the Maryland chapter of **The Arthritis Foundation,** 12 West 25th Street, Baltimore, Maryland 21218. This handbook will be given to patients only with the approval of the attending physician.

* * *

J. Sydney King, of WBAL-TV, Baltimore, has been awarded first prize in the 13th Annual Russell L. Cecil Awards for excellence in broadcasting about arthritis. His 90-minute program, "Arthritis: Questions and Answers," broadcast January 26, 1968, won him $500 and an engraved medallion.

* * *

A. Edward Maumenee, MD, professor and director of the department of ophthalmology at The Johns Hopkins University School of Medicine, has been named president-elect of the American Academy of Ophthalmology and Otolaryngology, and will assume his post January 1, 1970. On January 1, 1971, he will become president of the Academy.

Dr. Maumence served as first vice-president of the organization in 1964, and the following year was elected to the Academy's Board of Councilors and served a four-year term. At present, Dr. Maumenee is also ophthalmologist-in-chief at The Johns Hopkins Hospital.

* * *

An organization has recently been formed which is interested in halting the population explosion. **Zero Population Growth, Inc.** is a nationwide, nonprofit, volunteer organization geared to achieving zero population growth in the United States by 1980 and in the world by 1990. **Dr. Paul R. Ehrlich,** the author of the book *The Population Bomb,* and a biologist at Stanford University, is currently president of the group.

* * *

Reversing the position it had held since 1963, the **Internal Revenue Service** recently ruled that professionals (doctors,

lawyers, etc) can now incorporate to gain tax benefits. Although it had charged that professionals were incorporating to gain favorable tax treatment on funds allocated to pensions, retirement, profit-sharing, etc, courts repeatedly sided with the taxpayers and more states overruled the decision and passed appropriate legislation. The nation's independent business owners, voting through the National Federation of Independent Business, gave support to a bill introduced by Representative Ancher Nelsen of Minnesota to require IRS to recognize professional incorporations under state laws. The Internal Revenue Service's new position makes such legislation now unnecessary.

* * *

Richard S. Ross, MD, Clayton Professor of Cardiovascular Disease at The Johns Hopkins University School of Medicine, and director of the cardiovascular division of the department of medicine, recently delivered two major lectures in Great Britain, in which he reviewed his research of the past ten years. On November 13, 1969, Dr. Ross gave the Sir Thomas Lewis Lecture before the British Cardiac Society, at the Royal College of Physicians in London. He then traveled to Scotland for the Bronte-Stewart Memorial Lecture on November 20, 1969, at the University of Glasgow.

Dr. Ross has developed techniques for measuring blood flow to the heart, and has been studying the pressures developed within the heart during attacks of angina pectoris, as well as the biochemical changes that occur within the heart when it does not receive sufficient oxygen. He has been consultant to the National Heart Institute since 1961, and was president of the Maryland Heart Association in 1968.

* * *

Emile R. Mohler, Jr., MD, has been appointed Chairman of the Department of Medicine and Director of the Medical Services Laboratory at St. Agnes Hospital in Baltimore. Prior to assuming his new post, Dr. Mohler had been chief of St. Agnes' section of hematology since 1968.

A native of Baltimore, Dr. Mohler graduated from Loyola College and received his MD degree from Georgetown University, Washington, D. C. He served an internship at University Hospital in Baltimore, and completed his residency at St. Agnes Hospital, his last year as Chief Resident of Medicine. He has been awarded two fellowships and is a member of several national medical societies.

Dr. Mohler

* * *

The Upjohn Company has taken legal action to prevent the Federal Food and Drug Administration from enforcing an order that would remove seven of the company's combination antibiotic products from the market. R. T. Parfet, Jr., president and general manager of the drug company, feels that the FDA is in error and that their actions are certainly unjustified. The case is being heard before the U. S. Court of Appeals in Cincinnati, Ohio, this month.

* * *

At the October 19, 1969 meeting of the **Schizophrenia Foundation of Greater Washington, Inc.** held in Bethesda, Maryland, **David Hawkins, MD,** gave a talk which presented facts compiled from almost 1400 cases studied in a four-year period. A copy of the tape recording of Dr. Hawkins' talk will soon be added to the chapter library and may be reserved for group use.

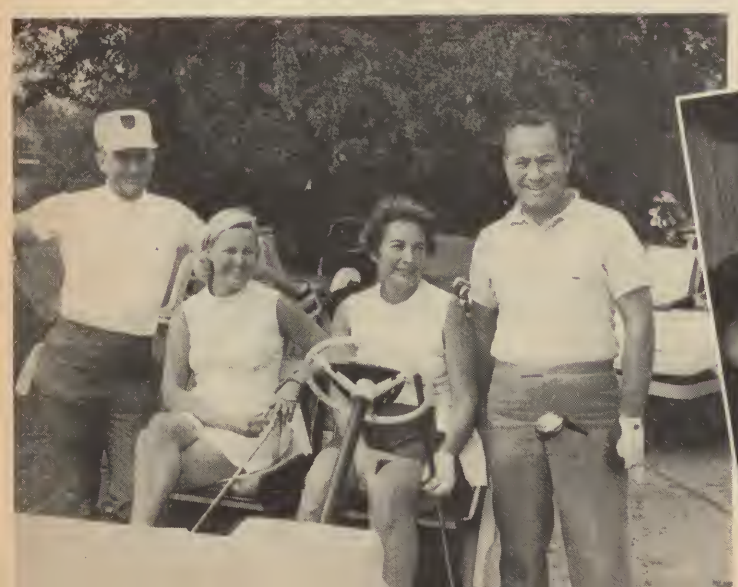
On November 20, 1969, **Albert A. Kurland, MD,** Assistant Commissioner for Research, Maryland Department of Mental Hygiene, and Director of the State of Maryland's Psychiatric Research Center, spoke before the Foundation on the topic "The Use of Psychotropic Drugs in Mental Health Research in Maryland State Hospitals."

* * *

The Senate Finance Committee has ruled that unrelated business income of tax exempt organizations is now taxable. Any income derived by a tax exempt organization which is not directly related to its tax exempt function would now be subject to taxation.

* * *

Share with Others—Give to
THE SALVATION ARMY



The Semiannual Meeting in Hershey in September appears to have been an out-and-out success. Witness (counter-clockwise) **the grins from the VIP table** (above)**: Dr. Elmer Linhardt, Mrs. Russell S. Fisher, Dr. DeWitt E. DeLawter, Dr. Fisher, Mrs. DeLawter, Dr. Wallace Sadowsky, Mrs. Linhardt and son, Bing. Even the small fry of the Chissell and Smoot clans enjoyed the festivities along with parents Dr. Roland Smoot, Dr. John Chissell and Mrs. Chissell.**

The frolicsome threesome at right are Barbara Laughlin, Mrs. Raymond Yow, and Faculty staff member, Mrs. Constance Galton (where there's fun there's Connie!). The golf course attracted Dr. and Mrs. William Dunsheath and Dr. and Mrs. William C. Ebeling. Then there was the knobby knees contest . . . won, of course, by Dr. Richard Bauer. Other identifiable contestants pictured are Dr. Sadowsky (with back? to camera), and Dr. Henry Laughlin. 1970's Semiannual, now in the works, sounds as though it's going to be even bigger and better.

Who sez the medical profession is stodgy?

The 1969 Med-Chi Semiannual Meeting in Retrospect

Hotel Hershey September 4, 5, 6

The Semiannual Meeting, under the chairmanship of DeWitt E. DeLawter, MD, was a complete success both socially and scientifically. Attendance at the scientific sessions and specialty society meetings was unusually good, and the panel discussion on drug abuse, sponsored by the Faculty, was attended by over 200 physicians and their wives.

In addition to the annual Friday evening banquet, the Woman's Auxiliary, under the direction of Mrs. Wallace H. Sadowsky, president, arranged a Fun Night. Mrs. Richard D. Bauer was mistress of ceremonies and cleverly introduced the entertainers.

One of the most ingenious acts was performed by Mrs. Elmer Linhardt and her daughter, Angie. Their tribute to "Our Men in Medicine" was musical and highly amusing. For the Welcome, Angie played "Hail! Hail! The Gang's all Here"; a general salute to our men in the field of medicine was "O Dear, What Can the Matter Be?"; surgeons rated "Mack the Knife"; pediatricians were greeted with "Ten Little Indians"; general practitioners were saluted with "Don't Fence Me In!"; gynecologists were heralded with "Keep Your Sunny Side Up"; obstetricians with "Mary Had a Little Lamb"; EENT's with "Look Down, Look Down, That Lonesome Road"; "I've Got You Under My Skin" was for the dermatologists; for the "heartbreakers", the cardiologists, Angie played "Heartaches"; urologists were saluted with "April Showers"; "Dem Bones" was aptly played for orthopedists; anesthesiologists were greeted with "I'm Forever Blowing Bubbles"; "Me and My Shadow" haunted the radiologists; proctologists with "There's a Long, Long Trail A-Winding"; pathologists listened to "Look for the Silver Lining"; and the "long-suffering psychiatrists" were saluted with "If You Knew Susie . . .". As a special salute to Dr. Russell S. Fisher, the whole assemblage joined in singing "For He's a Jolly Good Fellow", and then wound up the act with a salute to each other with "When the Saints Go Marching In."

Other features of Fun Night included the Washington County Auxiliary Warblers singing parodies; Mrs. Raymond Yow did a tap dance and led a Can-Can; Dr. Richard Bauer gave forth with some of his original recitations; and his daughters sang two lovely duets.

Another evening enjoyed by many members and their families was the "Monte Carlo Night" in the Game Room of the Hotel.

The first golf tournament held in connection with a Semiannual Meeting proved most successful with over 50 persons participating. First prize for low score went to Dr. William J. Peeples, Commissioner of Health for the State of Maryland.

The facilities and services at Hotel Hershey left nothing to be desired. The cooperation of the Hotel Staff was excellent.

Minutes

Semiannual Session, House of Delegates

(266th Meeting)

Medical and Chirurgical Faculty of the State of Maryland

Friday, September 5, 1969

Hershey Hotel, Hershey, Pa.

The 266th meeting, Semiannual Session, of the House of Delegates of the Medical and Chirurgical Faculty of the State of Maryland was called to order at 9:30 AM, Friday, September 5, 1969, at the Hershey Hotel, Hershey, Pa., the President and Secretary being present.

The following delegates (or alternates) were registered as being in attendance; an asterisk indicates an alternate delegate.

Doctors:

Robert G. Angle, Montgomery County; *Charles Bagley, III, Wicomico County; Timothy D. Baker, Baltimore city; John G. Ball, Council; James W. Banks, Washington County; Richard D. Bauer, Past President; M. McKendree Boyer, Past President; Henry A. Briele, Council; *D. Delmas Caples, Baltimore County; Douglas Gordon Carroll, Baltimore city; Katharine A. Chapman, Montgomery County; John T. Chissell, Council; John N. Classen, Baltimore city; Archie Robert Cohen, Washington County; Kenneth Cruze, Montgomery County; William B. Culwell, Carroll County; Worth B. Daniels, Jr., Baltimore city; Melvin B. Davis, Baltimore County; John B. DeHoff, Baltimore city; DeWitt E. DeLawter, Montgomery County; John M. Dennis, Council; J. Sheldon Eastland, Past President; Wm. Carl Ebeling, Council; Wolcott L. Etienne, Council; *Robert W. Farr, Kent County; James McC. Finney, Harford County; Vincent J. Fiocco, Carroll County; Russell S. Fisher, Council; Marvin Goldstein, Baltimore city; Paul F. Guerin, Council; William B. Hagan, Council; Louis E. Harmon, Baltimore city; Claude D. Hill, Baltimore city; Wm. A. Holbrook, Jr., Prince George's County; *Edward Hopf, Baltimore County; *John C. Hyle, Baltimore County; J. Parran Jarboe, Council; Frederick M. Johnson, Charles County; Ferd E. Kadan, Baltimore city; James R. Karns, Baltimore city; Seruch T. Kimble, Council; *John I. F. Knud-Hansen, Talbot County; *John M. Krager, Baltimore County; *Justinas Kudirka, Howard County; Henry P. Laughlin, Council; C. Rodney Layton, Queen Anne's County; Elmer G. Linhardt, State Board of Medical Examiners; Deonis M. Lupo, Baltimore city; *Francis C. Mayle, Jr., Montgomery County; Karl F. Mech, Council; B. Martin Middleton, Council; John E. Miller, Baltimore city; Donald W. Mintzer, Baltimore city; Marvin I. Mones, Council; *Howard T. Morse, Montgomery County; Frederick E. Musser, Prince George's County; Sidney Novenstein, Washington County; Chas. F. O'Donnell, Council; *J. Allan Offen, Montgomery County; Hilary T. O'Herlihy, Anne Arundel County; A. Austin Pearre, Past President; Wm. A. Pillsbury, Jr., Council; *Harold B. Plummer, Caroline County; J. Morris Reese, Council; Harry G. Reeves, Wicomico County; Thomas Reid, Frederick County; William F. Renner, Baltimore city; Philip L. Repetto, Jr., Prince George's County; Peter W. Rieckert, Dorchester County; Martin A. Robbins, Baltimore city; Raymond C. V. Robinson, Baltimore city; Donald J. Roop, Council; John F. Schaefer, Council; *J. Thomas Schnebly, Montgomery County; Arthur G. Siwinski, Council; R. Kennedy Skipton, Prince George's County; Roland T. Smoot, Baltimore city; Aaron C. Sollod, Baltimore city; Wm. G. Speed, III, Council; George R. Spence, Montgomery County; *Robert F. Spicer, Montgomery County; *William N. Thomas, Jr., Anne Arundel County; F. J. Townsend, Jr., Worcester County; Thos. E. Van Metre, Jr., Baltimore city; *Hugh W. Ward, Calvert County; Chas. H. Williams, Baltimore County; Charles E. Wright, Frederick County; Emerson C. Walden, Baltimore city; *N. Louise Young, Baltimore city; Raymond M. Yow, Council.

Present also were staff personnel.

Invocation

Donald W. Mintzer, MD, delivered the invocation.

Announcements

The President made certain announcements with regard to the conduct of business at the session.

Introduction of New Members

The President introduced the following new members of the House of Delegates:

Richard Y. Dalrymple, MD, Westminster (Council)

Marvin I. Mones, MD, Silver Spring, First Vice-President (Council)

Samuel Morrison, MD, Baltimore, Second Vice-President (Council)

Guy M. Reeser, Jr., MD, St. Michaels, Third Vice-President (Council)

Robert J. Thomas, MD, Frederick (Council)

Minutes

The minutes of the House of Delegates meetings of April 9, 1969 and April 11, 1969, having been distributed to the members and having been approved by the Executive Committee, were presented to the House for information.

Emeritus Membership

On motion of the Council Chairman, the following members who had received the recommendation of their respective societies and The Council, were elected to Emeritus Membership in the Faculty:

Baltimore City Medical Society:

Jerome J. Blumberg, MD
Warfield M. Firor, MD
R. Carmichael Tilghman, MD

all of Baltimore city

Honorary Membership

On motion of the Council Chairman, upon the Executive Committee's recommendations, the following individual was unanimously elected to Honorary Membership in the Faculty:

W. B. Kouwenhoven, Dr. Ingr., MD (Hon)

Adoption of Standing Rule

On motion of the Council Chairman, in accordance with previous notice, and on recommendation of the Council, the following Rule 4 of the Standing Rules was adopted by majority vote:

> A Committee chairman or the reporting member of a committee who is not a member of the House of Delegates shall have the privilege of making motions and speaking in debate in connection with the report of such committee. Others who are not members of the House of Delegates may, by a three-fourths vote, be extended the privilege of making a verbal report to the House for a time not to exceed five minutes. They may, by majority vote, be allowed to revise and extend their report for publication in the Transactions issue of the *Maryland State Medical Journal.*

Presentation of Viet Nam Plaque

The presentation of a plaque to **Wayne Foster, MD,** for voluntary service under the AMA Physician Volunteers for Service in Viet Nam was deferred because of his return to Viet Nam for continued service there.

Resolution Honoring John M. T. Finney, Jr., MD 1894-1969

Henry A. Briele, MD, President-elect, offered the following resolution honoring **John M. T. Finney, Jr., MD,** which was adopted unanimously by the House:

> Whereas, One of medicine's most illustrious and beloved persons was taken from this world on April 15, 1969; and,
>
> Whereas, **John M. T. Finney, Jr., MD,** is one of a long line of distinguished physicians known throughout Maryland, the United States and the entire world; and
>
> Whereas, To quote from an Editorial appearing in the Sunpapers shortly after his death:
>
> > "The lustre of his career is reflected in the lasting gratitude of the hundreds of patients who could never forget his warmth and understanding as well as his skill.";
>
> and,
>
> Whereas, He served with distinction in various organizations of physicians such as President of the Baltimore City Medical Society, Vice-president of the Southern Surgical Association, founder of the Eastern Surgical Society, and in many other medical and civic capacities; and
>
> Whereas, While he retired from active practice in 1953, he continued to evince an interest in all things medical; and
>
> Whereas, The characteristics, sympathies and compassion he showed to all with whom he came in contact were always self-evident and will always be remembered; be it
>
> *Resolved,* That the House of Delegates of the Medical and Chirurgical Faculty of the State of Maryland at its meeting held on September 5, 1969, take due notice of the death of **John M. T. Finney, Jr., MD;** and be it
>
> *Resolved,* That this resolution be spread upon the minutes of that meeting, with a copy to be sent to his nearest relatives together with this expression of regret on his death.

Resolution Honoring Bernard O. Thomas, Sr., MD 1882-1969

Dr. Briele presented the following resolution honoring **Bernard O. Thomas, Sr., MD,** which was adopted unanimously by the House and reads as follows:

> Whereas, **Bernard O. Thomas, Sr., MD,** was known as the dean of physicians in Frederick County; and
>
> Whereas, His death on April 15, 1969, creates a great void in the community and is a great loss to the medical profession; and
>
> Whereas, His unselfish devotion to the welfare of the people and the community he served was without peer; and
>
> Whereas, Words in themselves fail to express the high regard and esteem in which he is held by the profession in Maryland; and
>
> Whereas, Whatever is said can only begin to state the feelings of those persons who knew him and were in contact with him; be it
>
> *Resolved,* That the House of Delegates of the Medical and Chirurgical Faculty of the State of Maryland, on September 5, 1969, expresses itself as being deeply bereaved at the loss of **Bernard O. Thomas, Sr., MD;** and be it
>
> *Resolved,* That this expression of its sorrow and regret be spread upon the minutes of that meeting and a copy of this resolution be sent to the nearest relatives.

Treasurer's Report

Karl F. Mech, MD, Treasurer, presented the Auditor's Statement for the year ended 1968, and moved adoption of the certification statement that appears on this report. The statement was unanimously adopted.

Bylaws Committee Report

Charles F. O'Donnell, MD, Chairman of the Bylaws Committee, on its behalf, reported back to the House a substitute for Article IV, Section 3, which had been recommended at the Annual Meeting, April 9, 1969, and recommended rejection of the following amendment which was pending at the time of recommitment:

Pending Bylaws Amendment Not Adopted

A component society in the central and south central districts shall be entitled to be represented on the Council as nearly as may be possible by one Councilor for each 200 active and Forty-year members in good standing of such component society on December 31 of each year.

The foregoing amendment to the Bylaw amendment was rejected and Dr. O'Donnell moved adoption of certain amendments which, after debate, were adopted and the Bylaw amendment, as amended, was then adopted by more than the required two-thirds vote, as follows:

Substitute for Article IV, Section 3, the following new section which reads as follows:

Section 3. One third of the COUNCILORS provided below shall be elected annually by the House of Delegates from among the active and Forty-year members of component societies comprising the following districts:

(a) Western District: Allegany, Garrett, Carroll, Frederick and Washington Counties
(b) Eastern District: Caroline, Cecil, Dorchester, Kent, Queen Anne's, Somerset, Talbot, Wicomico and Worcester Counties
(c) Central District: Baltimore city, Baltimore and Harford Counties
(d) Southern District: Anne Arundel, Calvert, Charles, Howard and St. Mary's Counties
(e) South Central District: Montgomery and Prince George's Counties

Representation shall be on the basis of one Councilor from each district, plus one additional councilor for each 200 active and Forty-year, or major fraction thereof, members in good standing on the preceding December 31 each year.

Dr. O'Donnell on behalf of the Bylaws Committee moved adoption of the following Bylaw amendments all of which were enacted by the necessary two-thirds vote:

Amend Article IV, Section 1, by striking out the figures "22"

Amend Article XI, Section 11, by inserting the words, "and formulate guidelines" after the word "complaints."

Amend Article XI, Section 14, by adding an additional sentence which reads as follows:

"The tenure of office for this Committee shall be for one year and shall commence at a time that is mutually agreeable with the Maryland State Bar Association, so as to ensure that individual members shall serve conjointly with their respective counterpart members."

Amend Article XI, Section 15, by striking out the entire section.

Amend Article XI, Section 17, by substituting a proposed new section which reads as follows:

Section 17. *AN OCCUPATIONAL AND ENVIRONMENTAL HEALTH COMMITTEE* of at least five members shall study and report as it deems advisable upon occupational and environmental health matters. It shall consider such subjects as occupational health problems in industry; consumer protection matters such as food, drugs, etc.; hazardous substances, such as poisons, toys, devices, etc.; the quality of the health environment such as water and air pollution and land use, etc.; as well as traffic safety, such as warning devices, highway signs, automobile construction, accident evacuation, first aid training, etc.

Its chairman shall be appointed by the President and said chairman shall appoint the other members of the committee with the approval of the president.

The question as to what person or committee would arrange memorials or tributes to members or deceased members was referred to the Bylaws Committee for whatever action was deemed necessary.

(See page 105 for the complete report)

Information Committee Reports

The following reports were distributed in writing for the information of the meeting and an opportunity was afforded at this time to raise any questions:

Board of Medical Examiners—Elmer G. Linhardt, MD, *Secretary*

Medical Economics Committee—W. Kenneth Mansfield, MD, *Chairman*

Legislative Committee—B. Martin Middleton, MD, *Chairman*

Liaison Committee—W. Donald Mintzer, MD, *Chairman*

Mediation Committee—Lewis P. Gundry, MD, *Chairman*

Medicolegal Committee—Robert W. Johnson, III, MD, *Chairman*

Occupational Health Committee—Harold P. Biehl, MD, *Chairman*

Professional Medical Services Committee—George H. Greenstein, MD, *Chairman*

Representatives on the Medical Advisory Committee of the Red Cross Blood Bank Program

(These reports appeared in the June Journal)

Faculty's Delegates to the American Medical Association House of Delegates

Robert vL. Campbell, MD
J. Sheldon Eastland, MD
Russell S. Fisher, MD

(See page 108 for report)

Announcements

Various announcements were made for information of the House of Delegates.

Adjournment

The President, by general consent, declared the House adjourned *sine die,* at 10:30 AM.

WILLIAM A. PILLSBURY, MD, *SECRETARY*

Let's be specific about Campbell's Soups... and *reducing diets*

There are more than 30 million people in America who are overweight. During the next year, you probably will see more than 1,000 of them in your own practice.

One good way to help these patients is to give them a reducing diet based on ordinary eating patterns.

Campbell has prepared a sensible plan for weight control based on ordinary eating patterns. The plan consists of a patient instruction booklet and a set of menus which provide approximately 1,400 calories daily. The menus are balanced to provide the minimum daily requirements of nutrients.

To obtain a supply for your office write to:
Campbell Soup Company, Box 265, Camden, N. J. 08101

in acute and chronic diarrheas

LOMOTIL® SAVES...

TABLETS/LIQUID

Each tablet and each 5 cc. of liquid contain:
diphenoxylate hydrochloride .....2.5 mg.
(Warning: May be habit forming)
atropine sulfate, 0.025 mg. (1/2,400 grain)

body fluids... electrolytes... patients from exhaustion

Lomotil acts promptly and directly to lower the excessive intestinal motility of diarrhea. This therapeutic restraint on the overactive bowel allows a normal or more nearly normal reabsorption of water and electrolytes.

The proficiency of Lomotil in conserving body fluids and electrolytes often saves patients from the exhaustion that accompanies prolonged diarrhea.

Lomotil acts to control the intestinal mechanisms of diarrhea; therefore, it is highly useful in controlling diarrhea associated with:

gastroenteritis · acute infections · functional hypermotili
irritable bowel · ileostomy · drug-induced diarrhea

Warnings: Lomotil should be used with caution in patients taking barbiturates and with caution, if not contraindicated, in patients with cirrhosis, advanced liver disease or impaired liver function.

Precautions: Lomotil is a Federally exempt narcotic with theoretically possible addictive potential at high dosage; this is not ordinarily a clinical problem. Use Lomotil with considerable caution in patients receiving addicting drugs. Recommended dosages should not be exceeded, and medication should be kept out of reach of children. Should accidental overdosage occur, signs may include severe respiratory depression, flushing, lethargy or coma, hypotonic reflexes, nystagmus, pinpoint pupils, tachycardia; continuous observation is necessary. The subtherapeutic amount of atropine sulfate is added to discourage deliberate overdosage.

Adverse Reactions: Side effects reported with Lomotil therapy include nausea, sedation, dizziness, vomiting, pruritus, restlessness, abdominal discomfort, headache, angioneurotic edema, giant urticaria, lethargy, anorexia, numbness of the extremities, atropine effects, swelling of the gums, euphoria, depression and malaise. Respiratory depression and coma may occur with overdosage.

Dosage: The recommended initial daily dosages, given in divided doses until diarrhea is controlled, are as follows:

Children:	*Total Daily Dosage*
3-6 mo.	½ tsp.* t.i.d. (3 mg.)
6-12 mo.	½ tsp. q.i.d. (4 mg.)
1-2 yr.	½ tsp. 5 times daily (5 mg.)
2-5 yr.	1 tsp. t.i.d. (6 mg.)
5-8 yr.	1 tsp. q.i.d. (8 mg.)
8-12 yr.	1 tsp. 5 times daily (10 mg.)
Adults:	2 tsp. 5 times daily (20 mg.) or 2 tablets q.i.d.

*Based on 4 cc. per teaspoonful.

Maintenance dosage may be as low as one-fourth the initial daily dosage.

this ulcer did not heal...until its surface was cleared of dead tissue and debris

FIRST APPLICATION
ELASE Ointment is applied to a deep ulceration of a finger.

EIGHTEEN DAYS LATER
Healing has progressed rapidly without interruption or interference from any accumulated purulence or necrotic tissue. Greatly reduced size of lesion and minimal scar tissue indicate quality and vigor of healing which is almost complete.

to aid in debridement to facilitate healing in chronic cutaneous ulcers...

Elase® Ointment

(fibrinolysin and desoxyribonuclease, combined, [bovine] ointment)

PARKE-DAVIS

By helping to remove dead tissue and debris from the ulcer's surface, ELASE Ointment creates a better environment for the elimination of infection, for healthy granulation...*for healing.* Its lytic enzymes effectively break down DNA in dead leukocytes and other debris...the fibrin in blood clots, serum, and purulent exudates...and the denatured proteins in necrotic tissue. Protein elements of *living* tissue are relatively unaffected. ELASE Ointment is indicated in stasis ulcers and in other infected or inflamed ulcers caused by circulatory disturbances. In cases requiring skin grafting, it is used preoperatively for debridement. For ambulatory patients debridement with ELASE Ointment is a convenient therapy and a regimen likely to be followed. *Precautions:* Observe usual precautions against allergic reactions, particularly in persons with a history of sensitivity to materials of bovine origin or to mercury compounds. *Adverse Reactions:* Side effects attributable to the enzymes have not been a problem at the dose and for the indications recommended. *Discussion:* Successful use of enzymatic debridement depends on several factors: (1) dense, dry eschar, if present, should be removed surgically before enzymatic debridement is attempted; (2) the enzyme must be in constant contact with the substrate; (3) accumulated necrotic debris must be periodically removed; (4) the enzyme must be replenished at least once daily; and (5) secondary closure or skin grafting must be employed as soon as possible after optimal debridement has been attained. It is further essential that wound-dressing techniques be performed carefully under aseptic conditions and that appropriate systemically acting antibiotics be administered concomitantly if, in the opinion of the physician, they are indicated. *Available:* ELASE Ointment is supplied in 30-Gm. tubes containing 30 units (Loomis) of fibrinolysin and 20,000 units of desoxyribonuclease with 0.12 mg. thimerosal (mercury derivative); and in 10-Gm. tubes containing 10 units of fibrinolysin and 6,666 units of desoxyribonuclease with 0.04 mg. thimerosal. ELASE Ointment has a special base of liquid petrolatum and polyethylene; contains sodium chloride and sucrose used during manufacture; is stable at room temperature through the expiration date stated on the package.

For elderly patients in need of a mild tranquilizer consider **Tybatran**®

brand of tybamate

(When you consult the Prescribing Information you may agree it makes good sense)

PRESCRIBING INFORMATION

Indications: Tybatran (tybamate) has afforded symptomatic improvement in a variety of psychoneurotic disorders, especially in the treatment of the anxiety and tension components of psychoneuroses. Anxiety states manifested somatically have responded to Tybatran (tybamate).

Tybatran (tybamate) has been useful in the control of agitation in the aged and in the alleviation of some of the adverse emotional accompaniments of senility.

Tybatran (tybamate) has been used with benefit in the treatment of depressive symptoms associated with anxiety and other symptoms of psychoneuroses. However, it is not indicated for primary treatment of depressive states. It is not an antipsychotic agent, although it has been used as adjunctive therapy in some psychotic patients.

Dosage: One 350 mg. capsule, 3 times daily and two at bedtime is suggested as the adult starting dose. Adjust to suit individual requirements. Daily doses above 3000 mg. are not recommended.

Contraindications: Known hypersensitivity to tybamate. Since no studies have been done with this drug in human pregnancy, it should not be used in pregnancy unless the potential benefit outweighs the risk.

Warnings: Administer cautiously to patients receiving phenothiazines or other CNS depressants or having history of convulsive seizures (See Adverse Reactions). Consider possibility of additive actions with alcohol or other psychotropic agents, particularly phenothiazines or MAO inhibitors.

Precautions: Avoid abrupt withdrawal after prolonged use, although withdrawal symptoms have not been reported to date. Exercise caution in addiction-prone individuals. If symptoms of hypersensitivity occur, discontinue at once and initiate appropriate symptomatic treatment. Avoid activities requiring optimal mental alertness if drowsiness or vertigo are present. As with any new drug, use cautiously in patients with history of drug allergies, blood dyscrasias, and hepatic or renal disease; periodic measurements of hepatic, hematopoietic and renal function should accompany prolonged and/or high doses.

Adverse Reactions: Most frequent reactions, rarely requiring discontinuation of tybamate, include drowsiness, dizziness, nausea, insomnia, and euphoria. There have been a few reports of skin rash, urticaria, and pruritus. Rare side effects include hyperactivity, fidgetiness, flushing, and tachycardia, suggesting excessive stimulation; also ataxia, unsteadiness, confusion, feeling of unreality, "panic reaction," fatigue, headache, paresthesias, vertigo, gastrointestinal disturbances, glossitis, and dry mouth. Grand mal or petit mal seizures have been reported in a few hospitalized psychotic patients receiving tybamate (up to 6000 mg. daily) together with phenothiazines and other psychotropic agents, but not with tybamate alone. Consider the possibility of rare, serious adverse reactions such as may occur with the related drug, meprobamate. If excessive amounts are ingested, gastric lavage and symptomatic therapy, including central stimulants as necessary, are recommended. Before prescribing, consult package circular.

Supply: Tybatran (tybamate) is available in green, sealed capsules of three strengths: 350 mg., 250 mg., and 125 mg. Each strength is supplied in bottles of 100 and 500.

A·H·ROBINS

Senate Bill 404: A Working Solution to the State's Health Problems

Senate Bill 404, adopted by the 1969 General Assembly and signed into law by the Governor, became effective July 1, 1969. At that time, the newly created post of Secretary of Health and Mental Hygiene came into existence.

In 1960, the Committee of Medical Care of the State Planning Commission recommended that a "State Board of Health and Hospitals" be established to replace the former separate Boards of Health and Mental Hygiene. Under the new proposal, such a new Board would have had a Chief Executive Officer (probably a qualified physician) responsible for establishing policy and seeing that it was executed. Unfortunately, legislation drafted to create such a board was defeated, and the Commissioner of Health and Commissioner of Mental Hygiene retained their positions. Problems within the two policy-making bodies grew, and Maryland's health and mental hygiene problems merely increased in number and scope.

Recognizing the rapidly growing and acute problem, the State Legislature recently chose to reorganize the entire complex into one Department, headed by a Secretary who would be responsible to the Governor. Thus, after nine years of drifting, we finally have a properly and adequately organized Department of Health and Mental Hygiene.

The new Secretary and his assistants face a formidable task in reversing the course of Maryland's health programs. To date, the Secretary has exercised wisdom and skill in handling the numerous problems that were suddenly thrust upon him. He and his staff have made themselves readily available and have moved decisively and promptly in responding to requests for long-delayed answers on policy matters. We see no reason why this expertise cannot continue to be directed toward health programs for Maryland that will adequately serve its expanding population. We wish the new staff well and offer our assistance in whatever way we can to accomplish this objective.

John Sargeant

Electrodes for Cardiac Monitoring in the Coronary Care Unit:

Description of the Disposable Daisy Electrode

JOHN J. CURRY, MD
Director, Coronary Care Unit
Holy Cross Hospital
Silver Spring

Cardiac monitoring experience in the Holy Cross Hospital Coronary Care Unit, over a three-year period, is reviewed in respect to the various types of monitoring electrodes employed. The disposable Daisy electrode was used over a two-year period and after several improvements it was highly satisfactory. False alarms occurred not more than six times a week in a six-bed unit. The availability of this electrode led to great relaxation of former restrictions on the use of a bed-side commode and patient involvement in such self-care activities as partial bathing, feeding, reading, and the use of an electric razor. Obviously, the application of some of these features would improve the other disposable electrodes offered for monitoring purposes.

The rapid development of Coronary Care Units in the past several years has stimulated renewed interest in cardiac monitoring devices. Heart rate and rhythm disturbances may be recorded by ballistocardiography, impedance plethysmography, thermography, and peripheral pulse wave measurements. The majority of monitoring systems scan the RR or SS interval of the electrocardiogram for determination of rate and require a clear signal of good amplitude.

The monitoring problem differs from that of the clinical recording of the electrocardiogram in that motion and artifact must be expected and compensated for in a variety of ways. Skeletal muscle contractions, ambient electrical impulses, and electrode motion and battery action inevitably occur during continuous recording of the electrocardiogram of patients in the Coronary Care Unit. Indeed, the ability to monitor patients during the use of the bedside commode, and in self-care activities such as partial bathing, self-feeding, reading, and using an electric razor has led to great relaxation of restrictions in the bed care of such individuals. Extensive psychological studies in our unit over the past two years have led us to believe that these activities are extremely important to the patient. They do much to overcome the feeling of helplessness, depression and dependence that develops in so many patients with acute myocardial infarcts.

False alarms, resulting from poor, misplaced or detached electrodes, or from ambient electrical discharges, or skeletal muscle contractions, have plagued all Coronary Care Units. It is essential to overcome this problem because observation has shown that the personnel in many hospitals turn off the alarm systems and operate solely by visual scan of the oscilloscope. This practice results in delay in arrhythmia detection and treatment.

This report concerns our monitoring experience during a three-year period in the Coronary Care Unit at Holy Cross Hospital. During this time we tried, and abandoned, several types of electrodes ending with the development and improvement of the disposable Daisy electrode.

In any discussion of the prevention of false alarms it may be advantageous to consider first the recording and display apparatus itself and then the electrodes. In our instruments, not only is the amplitude of the R or S wave detected, but also the angle of inscription of the wave. Many skeletal muscle potentials are thus eliminated. More patient activity may then be allowed.

A lead fail system enables the detection of an improperly secured electrode, or one that becomes detached. When such an event occurs the impedance under the electrode undergoes a sharp rise and the lead fail alarm, an amber light, shows in place of an arrhythmia alarm, a red light. In our particular system a rise of over twelve thousand ohms in the recording electrode, or eight thousand ohms in the ground electrode, will register a lead fail alarm. The faulty electrode may be tested by pushing it against the skin with one finger. This will decrease the impedance and the lead fail signal should disappear. If the electrode is not securely fastened slight tugging on it will cause a lead fail signal to appear. Dry electrode paste will likewise cause a lead fail signal.

Alternating current is eliminated by common mode rejection. This is a standard method for dealing with this problem and is especially important in our system since we employ an unshielded electrode lead wire to allow more pliability and reduce expense.

Other systems have attempted to reduce false alarms by introducing a delay of several seconds or more between the advent of abnormal signals and registration of the alarm. This practice should be discouraged since it adds to delay in treatment; our delay period is only a few milliseconds.

Various hybrid computers are also available and these may be programmed to reduce false alarms. At the present time, the cost of this equipment is prohibitive.

The electrode problem presents many facets. The better grade of electrode with silver chloride on a silver surface develops less potential on interaction with skin, electrolytes, and electrode paste. Cost then precludes disposing of them, and time-consuming care and cleaning are essential. Surface abrasions, corrosion or placques of electrode jelly result in diminished efficiency. The size of the electrode must be large enough to give a good signal, but not so large as to make firm, even application to the skin a problem. Initially, we tried several types of flat conventional electrodes, but all were subject to motion and it was impossible to keep the electrode jelly moist.

Subcutaneous needles, electroencephalographic recording pins and stainless steel surgical sutures of varying sizes were also investigated. The pins were equally as effective as the needles and much less painful to insert subcutaneously due to their smaller size. It was noted that they could be inserted through and through intradermally with no pain whatsoever and yet a good signal could be obtained. The needles, pins, and stainless steel surgical sutures could be left in place for up to seven days with little reaction except for a slight redness at the injection sites. The application of antibiotic ointments did not prevent this reaction. However, we found it impossible to fix these devices in any way to prevent motion and the resultant false alarms. Patients also complained of painful tugging on the electrodes during motion.

The concept of a disposable electrode, with sav-

ings in time and cost, appealed to us and we began to use the Daisy electrode. Gradual improvements were made in the electrode over a two-year period and many types of material were tried and discarded. False alarms became more infrequent, and at the present time we have fewer than six false alarms a week in a six-bed coronary care unit.

Several aspects of monitoring electrodes should be considered: the electrode structure, location, manner of attachment to the skin, preparation of the skin, the electrode jelly employed and the room temperature and humidity.

The Daisy is a low cost, disposable, silver-plated stainless steel electrode. The ventral surface was originally covered with polyurethane to afford a spacer to keep the electrode in even contact with the skin. This caused the paste to dry out quickly and false alarms developed. It is now covered with pure gum-rubber with perforations to allow electrode jelly application. The sulfides of the rubber do interact with the electrode metals with the resultant increase in impedance, but this is a tolerable condition (Fig. 1).

Figure 1. Ventral surface of electrode showing gum-rubber spacer with removable protective covering over micropore attachment and unshielded connecting cable with push-on terminal.

The dorsal surface required numerous changes. Various methods of inserting or soldering the lead wire to the electrode were employed. If this junction was not sufficiently strong, fragmentation of wire threads would occur and result in false alarms. This difficulty was overcome by weld-brazing the tip of the wire to the electrode disk. The silver supplies material for brazing (Fig. 2).

Figure 2. Dorsal surface of electrode revealing weld-brazing of cable to electrode to prevent fragmentation of wire.

The connecting electrode wire itself represented a compromise with cost and performance. It is unshielded and hence may pick up alternating current interference. However, as pointed out earlier, this interference can be dominated in the recording apparatus. The wire is lightweight and pliable. Initially, an alligator clamp served for attachment to the patient cable. This shredded the wire filaments and gave rise to false alarms. A standard push-on terminal is now employed.

The electrodes are attached to the skin over the chest wall in areas where the skeletal muscle structure is not well developed. An exploring electrode may be used to locate a position giving a good signal and avoids the need to waste electrodes by repositioning them. We like to obtain a well inscribed P wave as well as a tall R or S wave in order to differentiate atrial as well as ventricular arrhythmias. The right side monitor electrode is positioned on the manubrium or upper sternum. The left side electrode generally is located on the left anterior axillary line over the eighth or ninth rib. The ground electrode is in a similar position except that it is on the right (Fig. 3). If the left side monitor electrode gives a better signal elsewhere, such as over the posterior chest, then this site is

employed. External pacing electrodes are not preplaced any longer since we rely almost entirely on the transvenous electrode catheter for treatment of heart block. In an emergency, subcutaneous needles make good external pacing electrodes. The monitoring electrodes should not be placed over angular bony prominences since close attachment to the skin cannot be made in such areas.

Careful preparation of the skin is essential. If body hair is longer than one sixteenth of an inch, a square inch area should be shaved for each electrode site. A gauze pad saturated with alcohol or acetone is rubbed over the area to remove oils and dry the skin. Since acetone dries more quickly it is preferred.

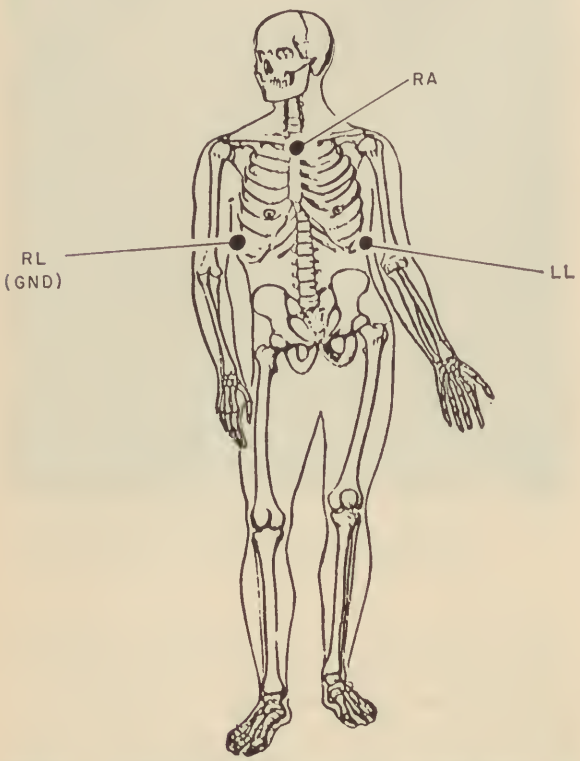

Figure 3. Electrode site locations recommended for monitoring.

The protective paper over the adhering surface of the micropore should be removed carefully to avoid contact with the surface. Four-tenths cubic centimeter of Cambridge electrode paste is applied to the disc with a syringe. Cambridge paste is employed because of a higher salinity. Excessive amounts of paste are avoided because contamination of the micropore leads to premature detachment of the electrode. Gentle pressure with the finger assures firm attachment of the electrode to the skin and prevents wrinkles. Gentle massaging of the applied electrode aids conduction.

Micropore represents a considerable improvement over adhesive or cellophane tape. It permits the passage of perspiration through its surface and hence promotes a longer and firmer attachment of the electrode. It is non-allergenic and permits bathing the area without fear of electrode dislodgment. The time required for electrode placement is short when careful attention is given to details. Great variation in cutaneous reaction is seen, especially in elderly patients with dry skin or light complected individuals. The electrodes may be left in place from one to seven days. The average length of time is three days.

Although our hospital is air-conditioned, we have not found this satisfactory in the Coronary Care Unit despite the installation of additional ducts. We would advise a separate air-conditioning system for the Unit. Excessive sweating does occasionally produce problems even with the micropore attachment. Much of this may be eliminated, however, with proper initial application of the electrode.

Supported in part by Contract No. PH 108-65-11 with the U.S. Public Health Service, Dept. of Health, Education and Welfare and Project Grant No. 09220-1, U.S. Public Health Service, Dept. of Health, Education and Welfare.

Daisy electrodes were kindly furnished by The General Electric Company through the courtesy of Keith C. Cormia.

Central venous pressure monitoring (CVP) has become a routine procedure on the wards of most hospitals. Its simplicity and reliability recommend its use in a variety of clinical situations.

Clinical Uses of Central Venous Pressure

NEIL A. ROBINSON, MD
Department of Surgery
Maryland General Hospital

Background

The current usage of CVP monitoring is basically derived from Starling's Law. He emphasized that venous pressure, especially right atrial, was a reliable index of cardiac competence. For as long as cardiac competence is present, right atrial pressures will stay within a narrow range; and as soon as myocardial fibers are overstretched and presystolic ventricular volume exceeds the capacity of the ventricular chamber, right atrial pressure will rise.[1]

Three useful corollaries for clinical application may be obtained from this hypothesis. First, when cardiac action is stable and there is no pronounced alteration of the vascular bed, blood volume and CVP will be *directly* related to each other.[2, 3] Next, when blood volume and the vascular bed are stable, cardiac competence and CVP will be *inversely* related.[1, 5-7] Finally, CVP may be unchanged, or may fall with a decrease in the tone of the vascular bed; and with an increase in the tone of the vascular bed, a rise may occur in the CVP in the incompetent heart and a transient rise may occur in the normal heart.[6]

Measurement

Measurement of the CVP requires the establishment of continuity between a simple measuring device and the *central* venous system. The latter is emphasized since measurements taken from peripheral veins are subject to errors arising from kinking of the vessels passing into the chest, as well as the pressure differential of the chest. In addition, peripheral venous constriction and venous valves interfere with the direct transmission of the right atrial pressure to the venous catheter.[4]

The literature is replete with numerous techniques for establishing continuity with the central venous system.[4, 5, 8, 9] These include cutdowns or percutaneous approaches to the jugular, subclavian, cephalic, saphenous, and femoral veins. The percutaneous route is preferable for its ease of entry, flexibility of management, and negligible infection rate. The saphenous and cephalic veins, because of their size and location, are not readily applicable to the percutaneous route. However, this approach is readily adaptable to the jugular, subclavian, and femoral veins. The femoral vein should be avoided when possible because of the incidence of phlebitis, phlebothrombosis, sepsis, pulmonary embolism and occasional mortality.[10] The femoral vein should be kept in mind when other veins are not available; for central venous pressure measurement in this area is identical to that of the superior caval system, except in the face of marked abdominal distention, when it may be falsely elevated. The percutaneous approach to the subclavian vein after Wilson [4] has been used exclusively by the author in over 200 patients with no morbidity.

Interpretation

After establishing continuity with the central venous system, a zero point is marked on the side of the supine patient ten centimeters from his back. This represents the level of the right atrium in the adult.[11] In children, one half of the anterior-posterior diameter of the chest is the correct zero point. A corresponding point is marked on the adjacent intravenous pole as the base line for subsequent measurements. With the use of a three-way stopcock, flow can be alternated from infusion to measurement as needed. All measurements must be made with the patient completely supine. The fluid in the manometer column should fluctuate with respiration to demonstrate an unobstructed connection to the central venous system.

The normal CVP in man ranges from three to eight centimeters of water. Isolated readings compared to this range serve as diagnostic indicators for the initiation of treatment. However, it is the trend

of the CVP, rather than any individual reading, which is significant in determining the patient's response.

Indications for Monitoring

The most important use of CVP monitoring is in the treatment of circulatory failure regardless of etiology. For here a working diagnosis can be made rapidly from the initial measurement of the CVP. We know from the corollaries outlined above that if the initial reading is low (0-5cm of water) the previously untreated patient is most likely to be hypovolemic. In any event, fluid therapy can be begun vigorously, and continued safely, until either a satisfactory improvement in the patient's condition has occurred or the CVP has risen to high levels (15cm of water or more). In the event the initial reading is in a normal range, fluid therapy may still be initiated with the same plan. However, if the initial reading is high (15cm of water or greater) the patient is most likely not hypovolemic. In any case, improvement of the cardiac status must be undertaken prior to vigorous fluid replacement.

Multiple causes of circulatory failure are sometimes evident. For example, circulatory failure may occur in the elderly patient who has a massive gastrointestinal hemorrhage, and a secondary coronary thrombosis. In this situation, central venous pressure monitoring will be of singular value in determining the amount and rate of transfusion, and the presence of cardiac failure. An elevated CVP in the presence of marked hemorrhage indicates there has been concomitant cardiac failure. This failure, *unrecognized*, would progress to pulmonary edema while the patient is being transfused; but with appropriate CVP monitoring the fine line between pulmonary edema and adequate tissue perfusion can be followed. In this hypothetical situation the absolute blood volume was not determined by the CVP, but more importantly, the patient's cardiac competence relative to *that* blood volume was indicated.

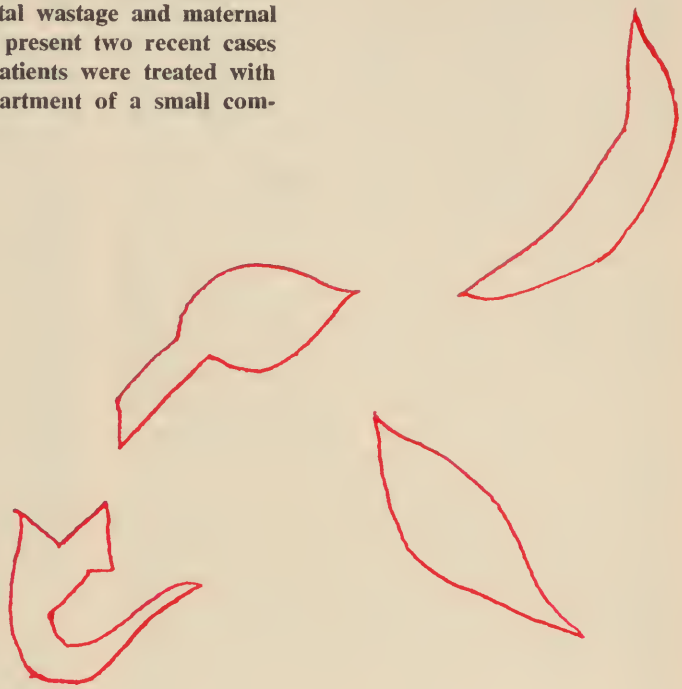
The use of CVP monitoring in the treatment of patients with circulatory failure is even more significant when we realize that they frequently are previously unknown to the treating physician. Assumptions concerning the cardiopulmonary status of these patients, regardless of age, cannot be made. Even the young can be overtransfused when the blood lost prior to treatment cannot be estimated, and conversely, the elderly patient may be undertreated with the result of a prolonged period of inadequate tissue perfusion.

The treatment of extensively burned patients should include CVP monitoring. Frequently there is not a readily available area for blood pressure measurement, and often no non-burned area for the introduction of a venous catheter. Usually the subclavian areas are unburned providing an aseptic intravenous route as well as an avenue to the central venous system. CVP monitoring is essential in burned patients for several reasons: It is an important adjunct to the serial hematocrit and urinary output for fluid replacement, especially in the presence of myocardial disease; it is of critical value in differentiating pulmonary edema from the wheezes and rales associated with respiratory burns; and in addition, if acute tubular necrosis supervenes, and urinary output can no longer be used for a guide to volume replacement, CVP monitoring is of singular importance.

Conditions in which widespread alterations in blood volume can be anticipated and poorly tolerated demand CVP monitoring, specifically in extensive cancer surgery or vascular surgery in elderly patients with brittle cardiovascular systems. CVP monitoring in these situations allows for rapid *adequate* replacement of blood, as it is lost, so that there is proper cardiac, cerebral, and renal tissue perfusion throughout the procedures.

Conditions in which difficult fluid and electrolyte problems exist, such as intestinal obstruction, pancreatitis, and peritonitis may be more vigorously managed with CVP monitoring. Here, large volume replacement is frequently necessary in desperately sick patients who can ill afford pulmonary edema. Rales and wheezes associated with allergic reactions, which occur not uncommonly in the management of these complex states, can be safely differentiated from pulmonary edema. This is particularly important in preventing a cessation of needed fluid in the mistaken attempt to treat pulmonary edema which does not exist.

The differential diagnosis of renal failure may be aided by the use of CVP monitoring, for a low initial reading suggests hypovolemia. A trial with appropriate fluid may then be undertaken to separate this diagnosis from obstructive uropathy.



Summary

Central venous pressure monitoring is presented as an addition to the physician's armamentarium in the treatment of a variety of clinical problems. It is not to be used alone in the diagnosis or treatment of the situations discussed above despite its singular usefulness in many of these.

CVP monitoring is not a substitute for blood volume measurement, a *static* test, but rather a *dynamic* tool for the constant interpretation of the relationship between cardiac competence and blood volume. It should be used in all applicable situations, for it requires only simple inexpensive equipment readily available on every hospital ward, yet it yields reliable minute-to-minute information not available by any other single method regardless of cost or complexity.

References will be supplied upon request.

Sickle cell disease is a most serious hemoglobinopathy, complicating pregnancy and causing alarming rates of fetal wastage and maternal mortality. The purpose of this report is to present two recent cases of sickle cell anemia in pregnancy. Both patients were treated with lifesaving transfusions in the obstetrical department of a small community hospital.

Sickle Cell Disease in Pregnancy—

A Report on Exchange Transfusions

NORMAN LEVIN, MD, FACOG
Baltimore

DESIDERIA TABANAO-MAHUSAY, MD
Lutheran Hospital

Approximately 8% to 10% of the American Negro population carries the hereditary sickle cell trait, with the incidence of sickle cell anemia being one in every 576 Negroes. However, the disease is not nearly so common in pregnant Negro women, perhaps only one fourth to one third of the theoretically calculated frequency.[1] The shortened life span of the sickle cell disease patient apparently does not permit a substantial number of such patients to survive long enough to become pregnant.

Fortunately for the obstetrician, people with this trait usually have reduced fertility. Puckett, in his report, claims that the average number of pregnancies among women with this disease is only 2.1 to 2.7, as compared with the over-all pregnancy rate of 3.5.[2] In addition, the incidence of spontaneous abortion is almost four times greater in those women with sickle cell anemia than in those with normal adult hemoglobin.[3]

This disease is characterized by the presence of an abnormal hemoglobin type S and abnormally shaped red cells. Sickling most frequently occurs in the presence of a low oxygen tension and acidity, thereby causing log jams within the smaller radicles of the vascular tree. This vascular stasis leads to agglutination and thrombosis, which in the lungs causes an increased anoxia with perivascular hemorrhage and necrosis.[4] Infections in these people may be catastrophic, particularly respiratory infections, since infection is often the initiating agent precipitating hemolytic crises.

The blood of sickle cell patients usually contains 75% type S hemoglobin, with more than 60% being diagnostic. In the heterozygous state (S-A), type S hemoglobin constitutes less than 45% of the cell hemoglobin, the remainder being normal type A hemoglobin. The disease also exists in intermediate forms in conjunction with other abnormal types, designated types C, D, and G.

Case Reports

Case 1:

M. T., 27 years old, Negro, para 0-0-6-0, STS negative, type B positive, with EDC July 8, 1968. The patient had diagnosed SS type sickle cell anemia. With this last pregnancy, she had been hospitalized several times due to painful episodes of thromboembolic crises. Her hematocrit varied between 20% and 27%. She was taking a phosphorus-free vitamin and mineral dietary supplement, plus 1 mg of folic acid (*Filibon FA*). In the early part of her last trimester, the estimated fetal weight was less than the norm for that time. Twenty-four hour urinary estriol levels were as follows:

May 27, 1968—17.2 mg/24 hours
June 10, 1968—15.3 mg/24 hours
June 18, 1968—10.6 mg/24 hours

On July 2, 1968, she was admitted to the hospital because of painful and marked swelling of her feet and legs. Bed rest and diuretics were prescribed. Two days later her edema subsided, but large inflamed varicose veins appeared along the course of the great saphenous on both sides of her legs. In the evening of July 5th, she developed a low-grade temperature with cough, pain, and rales in the left chest. A chest film taken early the next day disclosed either basal pneumonitis or infarct. An exchange transfusion was performed with #16 angiocaths in each anticubal vein, with 1500cc of fresh packed red cells and 500cc of whole blood. At first, 200cc were withdrawn and then replaced with the same amount of fresh blood; later, simultaneous withdrawal and infusion were performed. The patient's vital signs, as well as fetal heart tones, were closely monitored. There was difficulty in the withdrawal because of blood clotting, and the procedure took seven and a half hours. Heparinization was instituted following the exchange. Pelvic examination revealed a FT dilated cervix, 50% to 60% effaced, and a floating vertex with intact amniotic sac. Immediately following transfusion, her temperature rose to 102° F, her sputum was blood-tinged, and her hematocrit climbed to 45%. False-labor uterine contractions were also observed. Another 24-hour estriol level was only 4.8 mg. Promptly, the patient was delivered by a cesarian section of a 5 lb 12 oz male infant with Apgar score of 9. The amniotic fluid was dark yellow in color, somewhat viscid, and less than the usual amount. Just before surgery, the patient was given 50 mg of protamine sulfate. Her postoperative course was uneventful. Heparinization was resumed on the first postoperative day. The patient was discharged 14 days postoperative and placed on anticoagulant therapy. The baby's condition was good.

Case 2:

This patient was a 20-year-old Negro girl, para 1-0-0-0, whose LMP was on March 22, 1968, and EDC December 29, 1968. She was a diagnosed sickle cell anemia type SS, and had had recurrent painful episodes and attacks of bronchial asthma since early childhood. Since the age of nine, she had been hospitalized for crises, asthmatic attacks and several blood transfusions.

On October 28, 1968, she was admitted to the hospital in painful crisis with uterine size compatible with that of 30-weeks gestation with a good FH. She was exchange transfused on October 31 with 1000cc of whole blood and 750cc of packed red blood cells, and 2000cc blood was withdrawn without complication. She was discharged on November 2 in satisfactory condition. Her pre-exchange transfusion hematocrit and hemoglobin were 19% and

7.2 gm respectively, while her post-exchange transfusion hematocrit and hemoglobin were 31% and 10.7 gm.

She was admitted again on December 2 in crisis and asthmatic attack, and gradually responded to symptomatic treatment. She complained that the baby was not moving and the uterus did not seem to be growing. Urinary estriol level on December 9 was found to be 17mg. Amniotic fluid was darkly meconeum stained. She was exchange transfused on December 10 with 500cc of packed red blood cells, and 890cc of whole blood was withdrawn. Her pre- and post-exchange transfusion hematocrit were 20% and 33% respectively. The cervix was long and closed. She was delivered by a low transverse cesarian section, followed by a bilateral partial salpingectomy and an incidental appendectomy under spinal anesthesia. The female infant weighed 2693 gm and had an Apgar score of 9. The amniotic fluid, though abundant in amount, was meconium stained. Both mother and child were in satisfactory condition until discharge on December 20.

Comments on the Cases

Prior to the use of exchange transfusions, Eisenstein et al, in 1966, reported 30 maternal deaths among 138 patients with sickle cell anemia, for a maternal mortality rate of 21.7% and a fetal loss rate of 41.9%.[5] Ricks, in 1968, reported seven exchange transfusions in sickle cell anemia in pregnancy during the third trimester—two of the exchanges performed as emergency procedures—with the survival of all seven mothers and seven infants.[6] Anderson noted that following exchange transfusion, the patient remains free from crisis for approximately 60 days. Presumably, the presence of normal donor cells in the patient's circulatory system protects against the precipitation of crisis. The nature of this protection is not known, but a likely mechanism is the effect of the transfused cell upon the patient's blood viscosity; by their presence, normal cells decrease the absolute number of sickle cells and thereby decrease viscosity.[7]

In both of the above reported cases, the exchange transfusions were performed as emergency procedures, when the usual therapeutic tools such as antibiotics, bed rest, analgesics, folic acid, and oxygen were not sufficiently arresting the disease. Cesarian section, a much more formidable mode of delivery than the usual vaginal delivery, could be performed because both patients had previously been protected by the exchange transfusion—red blood cells functioning like normal cells while in circulation. On the basis of persistent low urinary estriols in one case, and a markedly meconium stained amniotic fluid, plus a lack of fetal growth in the other case, immediate delivery was mandatory. Neither case suggested vaginal induction of labor. It is also interesting to note that the exchange transfusion did not improve the urinary estriol levels.

Exchange transfusions of less than the amount advocated by Ricks were utilized on two separate occasions, in Case 2 with satisfactory results. This technique is more practical than total exchange transfusions, because it is sometimes difficult to obtain the necessary amount of fresh whole blood, and it is exceedingly difficult to perform the exchange transfusions within the average time of 70 minutes mentioned by Ricks.

Finally, it should be stated that the benefits of the partial exchange transfusion are only temporary, since the half-life of a normal red cell is 120 days and the half-life of a sickle cell is only 60 days.

Summary

Two cases of sickle cell anemia are reported, with exchange transfusions being performed as emergency procedures during the third trimester. These transfusions were necessary only after it became obvious that the usual therapeutic tools were not effective in stopping the disease. In one particular case, two partial exchange transfusions were performed on the same patient. For obstetrical reasons, both patients had to be delivered by cesarian section and both mothers and infants survived.

Phlebography in Leg Complaints

The first phlebograms were performed in man by Berberich and Hirsch in 1923, using Strontium bromide as the contrast material.[1] In 1931, Sgalitzer, Kolbert and Demel described a more acceptable technique.[2] Classic monographs on phlebography of the lower extremities were produced by Bauer and Hellsten in 1940,[3, 4] concerning their study of the effects of heparin therapy in thrombophlebitis. Accepted enthusiastically at first, the technique was soon abandoned due to difficulty with the radiologic technique, contrast material, injection sites, and equipment.

Early difficulty with interpretation of the films was probably due to use of insufficient amounts of dye to fill the venous system, and use of the supine position.[5] In spite of its loss of vogue, during the ensuing 45 years, several thousand phlebographic studies have been reported. As new techniques and contrast materials have appeared, renewed interest has developed. In 1967, Hershey, Magsaysay, and Aver reported their excellent and comprehensive study presenting results of more than 100 phlebograms of various types.[6]

The Mercy Hospital series of 100 phlebograms, begun in 1964 and continued through 1968, is an attempt to find a more logical approach to the treatment of varicose veins than those that have been reported in the literature. The Mercy program reinforces the previous conclusions. We have, however, been impressed by several of our own findings which are set forth in this communication. All of the patients were drawn from the author's private surgical practice, and the majority were studied in a single community hospital.

SALVATORE J. DEMARCO, III, MD, FACS
Attending Surgeon
Department of Surgery
Mercy Hospital

Acknowledgments: I wish to thank Thomas Cockey, MD, for his help in interpretations of the films, and his staff of X-ray technologists for their valuable technical assistance.

Method

The technique varies little from the accepted method, although the amount of contrast material is somewhat less and has varied as new products became available.

The patient is placed in a supine position on an X-ray table, the head end is elevated 30°, and a foot board is attached. Sufficient D-5-0.2 saline is infused through a 21 or 23 Butterfly, or pediatric scalp vein needle to insure that no infiltration will occur. After a 2ml test dose of Meglumine diatrizoate *(Renografin 60)* is infused, tourniquets are tied snuggly about the ankles 4cm above the tip of the malleoli. Thirty milliliters of contrast material is then injected by hand pressure over about a one minute period, and the 17″ × 14″ film in cassette beneath the lower legs and extending from ankle to the upper portions of the femoral condyles is exposed. Removing this and placing another cassette in the Buckey tray extending from the knee joint to inguinal area, requires approximately 20 seconds. This procedure is repeated a second time.

Subsequent to this, if only mild varicosities are evident, the patient is requested to push against the foot board five to seven times to milk the contrast material into unfilled vessels, and a third and fourth set of films is exposed.

Should marked varicosities be present, the patient may be tilted into a 5°-10° head down position, prior to exposure of the third and fourth sets, to overcome the tendency of the contrast material to pool in the lower extremities, dilute, and prevent proper visualization of the superficial femoral vein and its valves. Lateral views are obtained only if necessary. We do not hesitate to infuse 50 ml more dye if not satisfied with the results or to visualize the common iliac or Inferior vena cava. The latter requires a high thigh tourniquet to allow the dye to dam up, then suddenly flow as a bolus to the great vessel, similar to the method of Dale and Harris.[8] Dye is filtered out through the kidneys forming a nephro and pyelogram if desired. Approximately twenty minutes are required for the entire procedure. The only contraindications are known allergy to the dye, and strong history of drug reaction, or other allergies.

Case Presentations

L. C., this 40-year-old woman had vague aching in anterior lower leg and ankle. No definite pathology could be located. On the basis of similar clinical pictures, phlebography was performed revealing an essentially normal venous system with one anomalous deep vein, similar to that found in about 10% of this series. (Fig. 1, A & B)

Figure 1: A—Note anomalous deep vein of thigh; normal calibre and valve structure in these veins.

Figure 1: B—Normal communicating veins filling from the greater saphenous.

A. H., this 50-year-old woman was plagued with severe aching in the (R) lower thigh and intermittent cramping in the upper calf, for a six-year period. She had been treated for muscle spasm, myositis, arthritis and "nerves." Examination of the legs revealed a few scattered capillary bursts, but no obvious evidence of venous disease. Phlebogram

revealed markedly dilated incompetent communicators, and varicosities in both muscular and subcutaneous tissues. From the first postoperative day, to the present, three years later, she has remained totally asymptomatic. (Fig. 2)

Figure 2: Note the very incompetent communicators muscular and subcutaneous varicosities.

J. I., this 30-year-old religious brother, had known varicose veins of the legs for several years. For one year prior to surgery, he began to experience claudication-like pain in the (R) calf on prolonged standing and often in the recumbent position, which improved somewhat on exercising or elevating the legs. On examination, moderate superficial varicosities were present. The peripheral pulses were normal and equal. Two years after multiple ligation and stripping, using phlebograms to locate the communicators and deep varicosities, he is asymptomatic. (Fig. 3)

M. M., this 25-year-old operating nurse was well until eight months prior to surgery, when she began to notice recurrent swelling in the (R) lower leg and ankle with progressive aching and cramping. Symptoms were relieved by elevating the foot, and exacerbated by prolonged standing. She had recently been started on an oral estrogen-progesterone compound. Thorough physical examination, including gynecological consultation, revealed only a (R) leg and ankle 0.8 cm larger than the left, with good peripheral pulses and scattered capillary bursts. Phlebogram revealed moderately severe muscular and subcutaneous varicosities and incompetent communicators. A repeat phlebogram six months later,

Figure 3: Note filling of communicators from the deep circulation.

revealed an increase in the incompetency of the superficial communicating venous system. Two weeks following ligation and stripping, she returned to work to stand all day, the (R) leg having decreased in size till it was smaller than the (L). She remains asymptomatic three months post surgery. (Fig. 4)

Figure 4: Again the dilated perforators and deep varicosities are evident.

V. H., this 50-year-old woman who denied previous deep vein thrombosis, had undergone ligation and stripping in 1958, with subsequent development of superficial varicosities and edema, worse on the (L). Phlebogram revealed defects in the anterior tibial veins, bilaterally, which the author has attributed to the pressure of the cassette on the calves. Meticulous dissection of the superficial varicosities, with removal of the lesser saphenous system, resulted in bilateral edema beginning on the first ambulatory day without elastic stockings. Presently, after six months of wearing measured Jobst (R) stocking, the edema is 90% improved. New superficial veins are becoming obvious, not yet dilated or tortuous. (Fig. 5)

Figure 5: Four cm defect is present bilaterally. Proximal portion fills retrogradually, distal end has sharp cut off.

H. M., this 45-year-old man had diffuse and markedly dilated superficial veins, which he could observe to extend and enlarge daily. Though some tiredness was present at times, he was essentially asymptomatic. Phlebography revealed a superficial femoral and popliteal vein 1.5cm in diameter, larger than the upper limits accepted as normal in this small series. For this reason and because competency of the valves was questionable, the greater saphenous was preserved. Multiple ligation and stripping of the varicosities was performed. He remains asymptomatic. (Fig. 6)

M. V., this 35-year-old woman underwent ligation and stripping of the greater saphenous system in 1964. Following the last pregnancy, new and uncomfortable varicosities developed. Examination revealed mild superficial varicosities with one prominent 12cm vein in the (R) thigh, subjectively the most troublesome. Contrast material was injected through a varicosed calf vein without a tourniquet and drained directly to the deep as well as superficial circulation. Many of these varicosities were probably present during the previous surgery, but were not visible on inspection of the legs. Surgery was deferred until a later date. (Fig. 7)

Figure 6: Superficial vein is dilated and valves poorly visualized.

Figure 7: The large tortuous intradermal vein is very symptomatic and promoted surgical consultation.

Discussion

Venous disease of the lower extremities, present in more than 10% of the population over 35 years of age, may be familial, congenital and acquired. Women seem to be more widely affected than men, and in our series, predominated two to one. Observations of our patients suggests to us that hormonal levels play a large part in the development or aggravation of varicose changes. A significant number of these women in careful questioning, revealed that their symptoms are worse during the part of their menstrual cycle when hormonal levels are at their peak. Pregnancy aggravates venous diseases of the lower extremities from soon after conception, while the uterus is small, to several weeks after delivery. Only relatively late in the pregnancy does mechanical compression play a significant part.

Exogenous increase of hormones also seems involved in aggravation of the signs and symptoms. With the exception of that secondary to thrombophlebitis, pure acquired venous disease of the low extremity seems relatively rare. Here there is destruction of the valves and either recanalization with incompetency of the vessel or obliteration. Secondarily, there is an increase in hydrostatic pressure in the communicating and superficial veins out to the capillaries of the skin. Theoretically, destruction of the sapheno-femoral junction valve, from whatever cause, could result in a retrograde weakening and incompetency of the remaining deep valves with subsequent destruction of the superficial system. This has been advanced as the cause of most cases of varicose veins of the lower extremities.

In our series, however, 90% of the phlebograms displayed superficial femoral veins of a normal calibre with competent valves. Eight percent had either obvious thrombosis or no valves visualized due to rapid run off. Only 2% of the deep vessels were significantly dilated (1.5cm or greater) with apparent incompetent valves and no history of previous thrombosis.

The most impressive phlebograms were the 15% in which either totally unexpected problems, or much more advanced venous disease, was present than was suspected clinically. In general, such clinical tests as those of Trendelenberg, Pratt and Perthes did not correlate well with this series of patients.

As our study has progressed, it has become abundantly clear that the clinical appearance of the leg is a poor indication of the extent of involvement of subcutaneous intramuscular and communicating veins.

Six percent of our patients had only scattered capillary bursts on the skin of the involved extremity, but experienced much subjective discomfort. In all, the most important phlebographic finding was significantly enlarged and tortuous communicators filling from the deep circulation. Ligation and stripping including these communicators has resulted in complete relief.

We recommend phlebography on any patient with unexplained pitting edema of a lower extremity, vague complaints of discomfort or capillary bursts which cannot be accounted for by other means.

We have not found the method of Arnoldi [7] (interosseous phlebography) to be necessary in this series, and have limited experience in cineradiography which requires more time, more irradiation, and more elaborate equipment than is present in most community hospitals.

Conclusion and Summary

Venous blood flows from the superficial to the deep circulation of the lower extremities and does not regurgitate unless valvular incompetence is present. When it does, signs and symptoms develop. It is our impression, from this small series, that venous incompetence is more common than realized, and is often diagnosed as another disease process when varicosities are not evident. In the last four years, we have performed 100 phlebographies and have been impressed by the simplicity and value of this technique:

1. **it reveals situations where surgery is contraindicated;**
2. **it may reveal varicose changes where more serious disease processes are feared;**
3. **it may save the patient from the brand of "psychoneurotic" when persistent vague leg complaints persist, despite an essentially normal history of physical examination, and various types of treatment;**
4. **it presents a direct picture of the extent of venous disease and its location;**
5. **it allows the surgical approach to be tailored to the patient;**
6. **it may help prevent future frustrations of patient and surgeon by preventing or delaying recurrence;**
7. **it may be performed in any community hospital either as an outpatient, when surgery is not contemplated, or as an inpatient if it is.**

In February of 1968 the Baltimore City Health Department was asked to participate in a nutritional survey of all children in the Comprehensive Care Clinics across the country. This was to be a cross-sectional study of all the infants and children who appeared for any reason at each center during the months of March and April of 1968. It presented us with a good opportunity to study our own population in Baltimore. The figures which follow were the survey forms of the first 2,000 children.

The Nutritional Status of C/Y* Center Children

ALEXANDER J. SCHAFFER, MD
Assistant Commissioner of Health
Baltimore City Health Department

**Children/Youth*

For several reasons the results of this study cannot be considered conclusive. First, the numbers are not always statistically significant when they are broken down into the four centers and into various age groupings. Second, the presumed norms for the average middle-class population of the U. S. may not, for various reasons, be applicable to this group. Third, the haste imposed upon us by the lateness of the request rendered inevitable an undetermined number of errors. The most obvious of these we have discarded, but we are afraid that others may have been included. Analyzed in the simplest fashion were the following:

Center	Weight	Height	Hemoglobin
606-A	585	566	187
606-B	697	679	142
606-C	328	326	172
606-D	261	261	...
Totals	1871	1832	501

Weight: Figure 1 shows the distribution of the highest and lowest quartiles with respect to the weights of 1,860 children, translated into their calculated percentiles for age and sex. No distinction has been made with respect to race. Nor were children of low birth weight segregated. Table 10 of Nelson's Textbook of Pediatrics [1] was used for calculating percentiles. Keeping the earlier reservations in mind, it is apparent from Figure 1 that considerably more of our infants and children fall into the lowest quartile than the 25% expected, at least up to the age of approximately ten years. From then until 18 years of age this number falls, so that the distribution by quartiles in the later teen years approaches normalcy.

It seems safe to assume that there exists an excess of infants and young children whose weights are lower than they should be, whereas older children do not show this excess. Possible explanations are that more of the low-weight children die, or that many of these babies catch up as the years pass, or possibly that an excessive number of children in this population become obese.

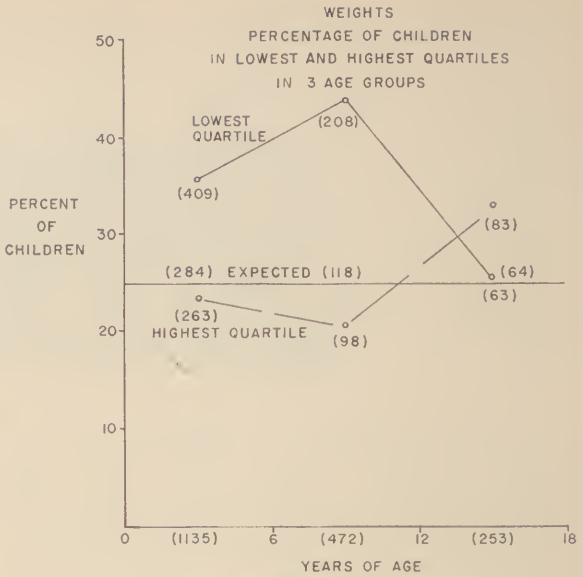

Figure 1

Figure 2 breaks down the total in the lowest quartile into its four component C/Y Centers. There appears to be good consistency among them, and the ranges are not excessive considering the small size of the groups. It was anticipated that 606-D might differ considerably from the others in that it alone is composed very largely of white children, but it is unlikely that any of the differences seen are significant.

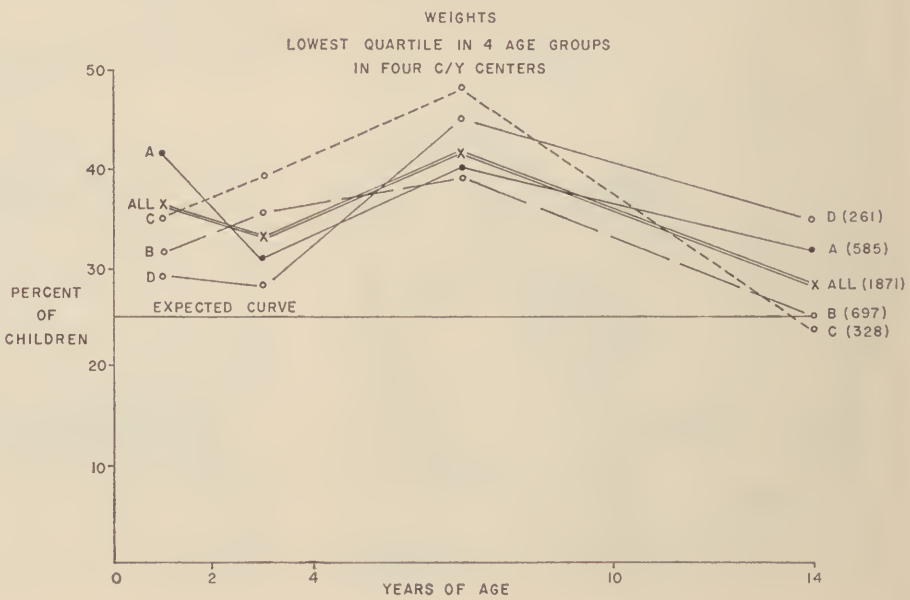

Figure 2

Height: Again one sees, in Figure 3, the excess of first quartile heights over the expected. The curve up to 12 years is not much different from that depicting weights, but in the 12- to 18-year period it does not return as close to the normal as does the weight curve. We must record many more weight-height observations of this nature, for this conclusion will be highly important if it can be verified.

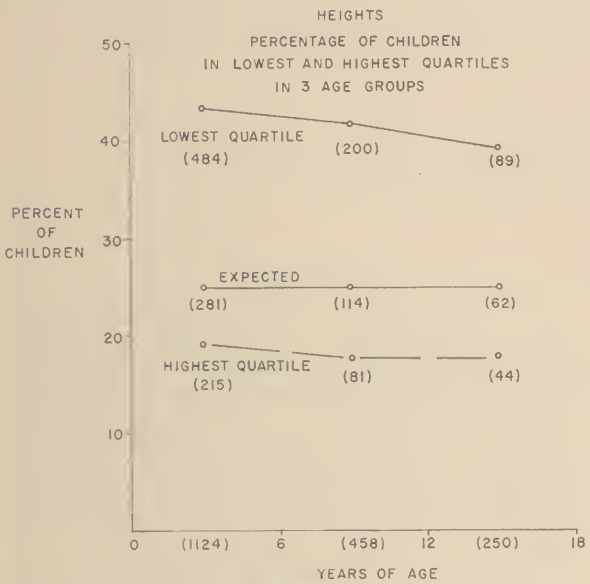

Figure 3

Third Percentiles for Weight and Height

An even more sensitive index of failure to thrive and grow at the usual rate should be the number of children who fall into or below the third percentile range. Figure 4 demonstrates the remarkable excess in our population in this lowest category, with a spread of from four times the expected number in one center to six times as many in another with respect to weight. The figures for height are even more surprising—from six times expected in one center to nine times in another! Figure 5 breaks down the heights into three age groups—0 to 6, 6-12, and 12-18 years. Again one sees the sevenfold excess of stunted children in the first six years of life, rising slightly, but possibly significantly, in the second six-year period, and then falling in the 12-18 year age group to a four-times expected figure.

Relation of Later Height to Birthweight

We wondered whether the excesses of short stature discovered in infancy and childhood were due to an original excess of low-weight babies. Fortunately this question could be explored. (See Figure 6). Exactly one fifth had weighed 2500 g or less at birth, and only a few less of the total

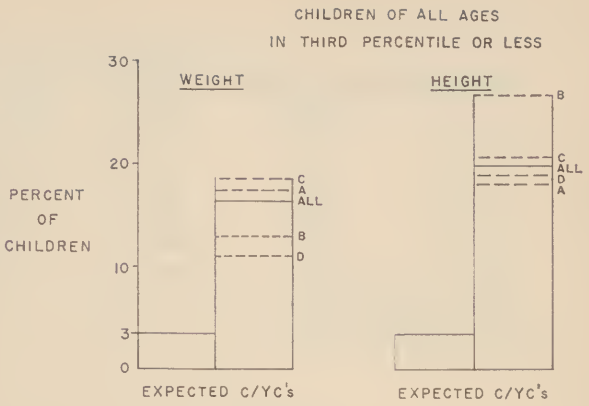

Figure 4

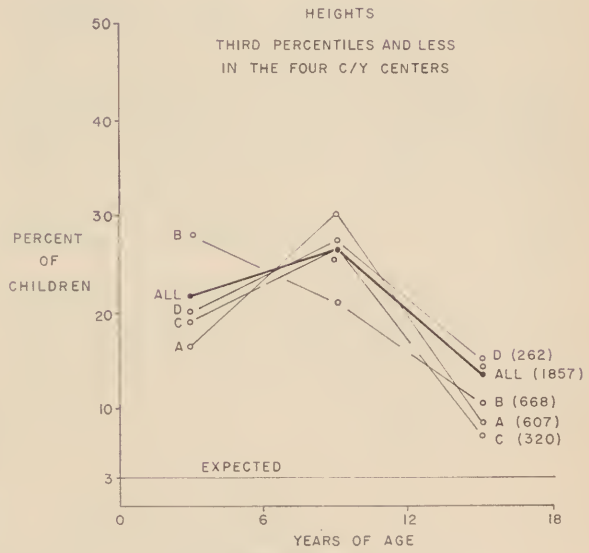

Figure 5

fell into the third percentile or lower for height grouping when measured at a later date. But it is not this simple. One third of those who started life as low birth weight infants are identified later as third percentile for height, while one sixth of those who began as mature infants weighing more than 2500 g also ended up in this same low height category. In 606-D, where the population is predominantly white, the rate of "prematurity" was found to be 12%, quite unlike the 18% to 22% rates found in the other predominantly nonwhite centers. Yet 606-D's figure for third percentile children later in life turns out to be considerably higher than those of the other three C/Y centers. It is hard not to conclude that much of the stunted growth in our indigent population is acquired, and is not dependent upon low weight or immaturity at birth.

Figure 6: NUMBERS OF THIRD PERCENTILES FOR HEIGHT AS RELATED TO LOW OR HIGH BIRTH WEIGHTS

C/Y Center	Total Number	Third Percentiles	Began Life as Low BW's	Third Percentiles	Began Life as Full Term	Third Percentiles
[1]606-A	498	18.4%	22.7%	40.7%	77.3%	11.9%
[1]606-B	405	18.7%	22.7%	30.4%	77.3%	15.3%
[1]606-C	309	19.4%	18.1%	26.8%	81.9%	17.7%
[2]606-D	221	20.3%	12.2%	22.2%	77.8%	20.1%
Total	1,433	19.0%	0.1%	32.9%	81.0%	15.5%

[1]Predominantly nonwhite.
[2]Predominantly white.

Hemoglobin Concentrations: Figure 7 demonstrates the findings with respect to hemoglobin determinations in the four Comprehensive Care Clinics. The presumed normal curve was again constructed from Nelson's Textbook of Pediatrics.[1] Five hundred one determinations were made among these same 2,000 infants and children. It will be seen that in the population under study the mean hemoglobin level ranged from 1.0 to 2.0gm below the presumed normals.

Time has not permitted an analysis of the hematocrit levels obtained during this same study, but a hasty survey indicates that they too will demonstrate the same degree of anemia as do the hemoglobin concentrations.

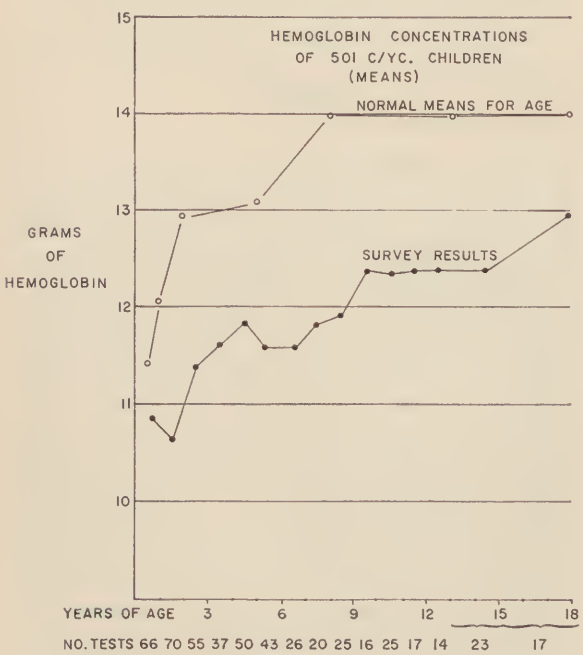

Figure 7

Summary

This unsophisticated analysis of the nutritional status of approximately 2,000 children in our four C/Y Centers can only strengthen our conviction that many of them have been and still are nutritionally or culturally deprived or both to the point of retardation of normal physical growth. One can only guess at, and be horrified by what this same deprivation may have done to their intellectual growth.

I have little doubt that similar findings would come to light if we studied our Well-Baby Clinic clientéle in the same way, whether they be the usual clinic population or the presumably élite Project 501 infants and children.

All of us, pediatricians, public health nurses, nutritionists and our paramedical assistants, must realize that this is our primary task. If we cannot do a better job on the nutrition of our infants and children how can we expect to accomplish anything worthwhile in the infinitely more complicated tasks concerning their intellectual, emotional and social development?

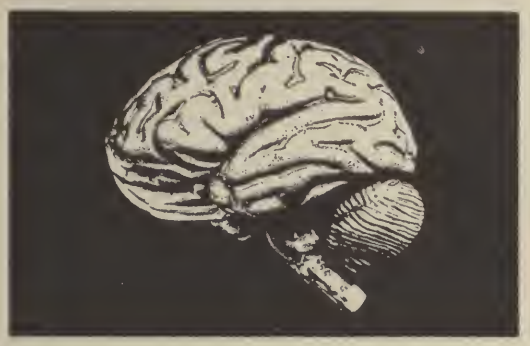
your medical faculty at work



by John Sargeant
Executive Secretary

The Executive Committee met on Thursday, October 30, 1969, and took the following actions:

1. Designated various members for appointment to the Physicians' Review Committee of Blue Cross;
2. Selected dates for 1970 Executive Committee and Council meetings;
3. Set the date of Saturday, December 13, 1969, at 2:00 pm for a special meeting of the House of Delegates to consider Bylaw changes in connection with provision of legal defense for Faculty members;
4. Declined again to designate a member of the Administrative Committee, Regional Medical Programs;
5. Authorized appointment of various members to serve on an Advisory Council on Human Trials which would act as a group in advising the Secretary of Health and Mental Hygiene on these problems;
6. Confirmed that appropriate action was taken in connection with rendering advice and consultation to Blue Shield plans on Medicare services by certain physicians;
7. Determined that a question of Health Data Processing Activity in connection with utilization review and peer review activities was one that should be determined by local medical staffs in hospitals;
8. Adopted a revised Nurses Protocol as recommended by the Nurses Liaison Committee;
9. Approved a proposed Sports Curriculum for Sports Trainers, as recommended by the Subcommittee on Sportsmedicine;
10. Approved the mailing of a letter to members in selected components regarding the medical evaluation form for students planning to participate in Interscholastic sports programs;
11. Determined that AMAERF contributions would be channeled through the Woman's Auxiliary so that this group could obtain credit for such contributions made by Faculty members;
12. Designated a representative to attend a meeting with the State Health Department to discuss General Hospital Professional Components under Title 19 programs;
13. Adopted a revised policy recommendation to the Council in connection with provision of Laboratory Services.

Diagnostic Treatment Trends

Nearly half of the 11,997 admissions to Maryland's psychiatric hospitals in 1968 were for the treatment of alcoholism. The number of such admissions has more than tripled in the last six years (from 1,785 in 1962 to 5,957 in 1968). Preliminary data for 1969 indicate that a majority of the 14,085 admissions were alcoholics. However, since virtually all are released after a short period of hospitalization, the proportion of all residents diagnosed as alcoholics increased also but reached only 10.5% by 1968.

	ADMISSIONS DURING YEAR		RESIDENT PATIENTS AT END OF YEAR	
PSYCHIATRIC DIAGNOSIS	1968	1962	1968	1962
TOTAL—NUMBER	11,997	6,221	7,624	7,945
PERCENT	100.0	100.0	100.0	100.0
ALCOHOLISM	49.2	28.6	10.5	5.6
OTHER PERSONALITY DISORDERS	8.2	6.2	4.0	3.0
PSYCHONEUROTIC REACTIONS	6.3	6.8	2.5	1.9
SCHIZOPHRENIA	14.3	27.8	40.8	46.9
OTHER PSYCHOTIC DISORDERS	3.0	5.7	4.9	6.5
DISORDERS RELATED TO OLD AGE	5.3	11.7	13.9	14.1
MENTAL RETARDATION	1.1	2.5	7.3	9.7
ALL OTHERS	12.6	10.7	16.1	12.3

The number of admissions with a diagnosis of schizophrenia declined slightly from 1,738 in 1962 to 1,730 in 1968. Proportionally, this represented a drop from 27.9% to 14.3%, the lowest level in recent years. Although the number of chronic, long-term schizophrenics has been decreasing for some time, they continue to occupy two out of every five beds. A similar trend occurred for patients with other psychotic diagnoses. In 1968 these accounted only for 3.0% of all admissions and 4.9% of all residents.

Admissions for disorders related to old age have gradually decreased in recent years and are now only 5.3% of all patients entering care. This undoubtedly reflects the expansion in nursing homes and other community care facilities. Most remain hospitalized until ultimate death and they occupy 13.9% of all hospital beds.

Although Maryland has two hospitals for the mentally retarded, there were 129 retarded admissions and 553 resident patients in psychiatric hospitals during 1968. Most retarded residents have been hospitalized for some time and releases are mainly among recent admissions. The decline in the number of retardates in psychiatric hospitals is mainly due to deaths and to transfers to Rosewood and Henryton.

While most admissions are now for the short-term treatment of acute nonpsychotic disturbances, the majority of state hospital beds continue to be occupied by chronic, long-term psychotic patients. Since the number of releases in this group continues to be small, it must be expected that they will require a substantial proportion of hospital services in future years unless new methods of treatment and care are available.

Ornade® Spansule®

brand of
sustained release capsules

Trademark
Each capsule contains 8 mg. of Teldrin® (brand of chlorpheniramine maleate); 50 mg. of phenylpropanolamine hydrochloride; 2.5 mg. of isopropamide, as the iodide.

Prompt relief from nasal congestion and hypersecretion due to colds.

Before prescribing, see complete prescribing information in SK&F literature or *PDR*.
Contraindications: Glaucoma, prostatic hypertrophy, stenosing peptic ulcer, pyloroduodenal or bladder neck obstruction.
Precautions: Use cautiously in the presence of hypertension, hyperthyroidism, coronary artery disease; warn vehicle or machine operators of possible drowsiness.
Usage In Pregnancy: Use in pregnancy, nursing mothers and women who might bear children only when potential benefits have been weighed against possible hazards.
Note: The iodine in isopropamide iodide may alter PBI test results and will suppress I^{131} uptake; discontinue 'Ornade' one week before these tests.
Adverse Reactions: Drowsiness; excessive dryness of nose, throat or mouth; nervousness; insomnia. Other known possible adverse reactions of the individual ingredients: nausea, vomiting, diarrhea, rash, dizziness, fatigue, tightness of chest, abdominal pain, irritability, tachycardia, headache, incoordination, tremor, difficulty in urination. Thrombocytopenia, leukopenia and convulsions have been reported.
Supplied: Bottles of 50 capsules.

One capsule q12h for round-the-clock relief

SK&F Smith Kline & French Laboratories

ROBERT E. FARBER, MD, MPH, COMMISSIONER

Baltimore City health department

New Appointment

Dr. Guarnieri—Division for the Handicapped

Susan R. Guarnieri, MD, has been appointed Clinical Director of the Division for the Handicapped in the Child Health Services section of the Baltimore City Health Department. In this post Dr. Guarnieri will be responsible for the evaluation and follow-up of handicapped children referred for assistance by physicians and by official and nonofficial agencies. Since the greatest number of children are referred by schools her work requires close cooperation with the Health Department's Bureau of School Hygiene and Bureau of Public Health Nursing as well as the special services divisions of the city public and parochial schools.

Dr. Guarnieri, a native of Youngstown, Ohio, attended St. Mary of the Springs College in Columbus and received her MD degree from the Ohio State University College of Medicine in 1966. Completing internship at Mt. Carmel Hospital in Columbus in 1967, Dr. Guarnieri held a one-year residency in public health at the Philadelphia Department of Health followed by attendance at The Johns Hopkins School of Hygiene and Public Health where she obtained the Master of Public Health degree in June 1969.

The City Health Department's Division for the Handicapped registered 1,575 children last year and referred 189 youngsters with multiple handicaps to the Diagnostic and Evaluation Centers at the Johns Hopkins and University of Maryland hospitals. Over 27,000 children have been registered by the division since the program was established with the assistance of the Division of Crippled Children's Services of the Maryland State Department of Health in 1956.

Dr. Guarnieri's office is on the second floor of the American Building, Baltimore and South Streets, telephone 752-2000, extension 753.

New Recreation Center for Alcoholics

On October 20th the City Health Department dedicated a Recreation-Treatment Service for alcoholic patients attending the city's Alcoholism Center.

Located in the basement of the Center building at 2221 St. Paul Street, the recreation room and its equipment was made possible through the efforts of the Center's Community Advisory Board chaired by Mr. Charles Duff, its House Committee under the chairmanship of Senator Julius Lapides, volunteer members of the Electricians, Plumbers, Carpenters unions, the Baltimore Building and Construction Trades Council, and anonymous donors.

According to A.M. Schneidmuhl, MD, Director of the Alcoholism Center, the Recreation-Therapy Service will fill a social need for alcoholics undergoing treatment. Many alcoholics complain of loneliness, and revert to former drinking habits out of boredom or inactivity.

The recreation room, by providing television, reading materials, games and other activities, will be a constructive diversion for such patients. Here alcoholic patients may find companionship, friendship, and sympathetic encouragement.

Furthermore, the new service, open evenings and weekends, will present additional opportunities for alcoholism counselors, students in the alcoholism training program and volunteers to involve patients in group discussions and lectures thereby reinforcing the daytime treatment at the Alcoholism Center.

Physicians who may wish assistance with their alcoholic patients may call Dr. Schneidmuhl, telephone 752-2000, extension 2756.

From the Subcommittee on Alcoholism of the Medical and Chirurgical Faculty of the State of Maryland

Guidelines for Admission of Alcohol-Dependent Patients to General Hospitals

In June 1966, the House of Delegates of the AMA reaffirmed a statement it had adopted ten years earlier on admitting alcohol-dependent patients to general hospitals.

That statement referred to the growing acceptance of the fact that such patients are ill and are a medical responsibility. This acceptance, coupled with improved treatment methods and increased knowledge of and experience with alcohol problems, have largely obviated previously cited objections to hospital admission.

The statement further emphasized the need for each patient to be evaluated individually, and for the possibility of admission to a hospital to be decided solely on the basis of the particular clinical indications observed in the patient at the time and as determined from his history. Exactly the same criteria are applicable to the alcohol-dependent person as to any ill person where hospitalization is being considered as requisite to medical management.

The following guidelines are offered to assist the examining physician in making his determination regarding admission to a general hospital:

(1) A patient who is diagnosed as "alcoholic" by a physician, or who is so known by the hospital or by other responsible agencies and individuals, should be admitted if he:

a. has an infectious disease;
b. has hyperthermia;
c. has a history of convulsions, or a poorly controlled convulsive disorder, and has been drinking;
d. is hemorrhaging or unconscious;
e. wants to be withdrawn from alcohol, either for the first time or after having relapsed to drinking;
f. has a disulfiram—alcohol reaction.

(2) A person should be admitted to a hospital either under the tentative diagnosis of alcoholism, or as a known alcoholic patient, as the case may be, when he:

a. is unconscious and has been drinking;

b. is agitated and tremulous to the extent of indicating an acute withdrawal syndrome;

c. has convulsions, hallucinations, or delirium tremens, manifesting a complicated withdrawal state;

d. is suffering from a disease recognized as related to alcoholism (eg, cirrhosis, neuropathy, pancreatitis) and wishes to be withdrawn from alcohol;

e. has a disease or post-traumatic injury usually not requiring hospitalization, but also has a history of prolonged drinking, or of heavy ingestion of alcohol immediately prior to the illness.

The psychiatric unit, rather than the general medical service, or psychiatric consultation should be considered in one or more of the following circumstances:

(1) the patient is overtly psychotic;

(2) the patient is so severely depressed that he is probably suicidal;

(3) the patient represents a serious management problem because he is extremely confused or has other behavioral difficulties that cannot be adequately managed on a medical or surgical service.

As with any patient, the alcohol-dependent patient should be discharged from the hospital as soon as such discharge is medically indicated. In each instance, however, appropriate plans should be made prior to discharge for continuing after-care at the hospital or by a private physician, or, as frequently will be required, for psychological and social rehabilitation by public and voluntary agencies.

This statement was approved by the Council on Mental Health. Reprint requests to AMA Council on Mental Health, 535 N. Dearborn St., Chicago 60610. Reprinted with permission of the JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION, *October 6, 1969, Vol. 210, No. 1, page 121.*

His heart tells him he's an invalid.
You know he's not.

Photograph professionally posed.

Contraindications: History of sensitivity to meprobamate.

Important Precautions: Carefully supervise dose and amounts prescribed, especially for patients prone to overdose themselves. Excessive prolonged use has been reported to result in dependence or habituation in susceptible persons, as alcoholics, ex-addicts, and other severe psychoneurotics. After prolonged excessive dosage, reduce dosage gradually to avoid possibly severe withdrawal reactions. Abrupt discontinuance of excessive doses has sometimes resulted in epileptiform seizures.

Warn patients of possible reduced alcohol tolerance, with resultant slowing of reaction time and impairment of judgment and coordination.

Reduce dose if drowsiness, ataxia or visual disturbance occurs; if persistent, patients should not operate vehicles or dangerous machinery.

Side Effects include drowsiness, usually transient; if persistent and associated with ataxia, usually responds to dose reduction; occasionally concomitant CNS stimulants (amphetamine, mephentermine sulfate) are desirable. Allergic or idiosyncratic reactions are rare, but such reactions, sometimes severe, can develop in patients receiving only 1 to 4 doses who have had no previous contact with meprobamate. Previous history of allergy may or may not be related to incidence of reactions. Mild reactions are characterized by itchy urticarial or erythematous maculopapular rash, generalized or confined to groin. Acute nonthrombocytopenic purpura with cutaneous petechiae, ecchymoses, peripheral edema and fever have been reported. One fatal case of bullous dermatitis following intermittent use of meprobamate with prednisolone has been reported. If allergic reaction occurs, meprobamate should be stopped and not reinstituted. Severe reactions, observed very rarely, include angioneurotic edema, bronchial spasms, fever, fainting spells, hypotensive crises (1 fatal case), anaphylaxis,

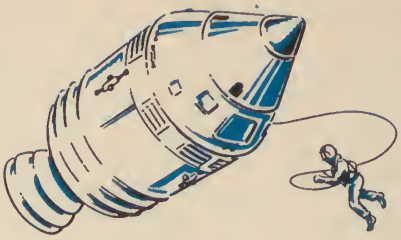
atrally, you'll want to reassure the patient.

noperhaps prescribe Equanil (meprobamate)
s djunctive therapy. It helps relieve anxiety
ndension specifically, yet gently.

lmst 15 years' use has shown that Equanil
uually well tolerated as well as effective.
d effects are generally limited to transient
rosiness; serious, therapy-interrupting
deeffects are rare.



stomatitis and proctitis (1 case) and hyperthermia. Treat symptomatically as with epinephrine, antihistamine and possibly hydrocortisone. Aplastic anemia (1 fatal case), thrombocytopenic purpura, agranulocytosis and hemolytic anemia have occurred rarely, almost always in presence of known toxic agents. A few cases of leukopenia, usually transient, have been reported on continuous administration.

Meprobamate may sometimes precipitate grand mal attacks in patients susceptible to both grand and petit mal. Extremely large doses can produce rhythmic fast activity in the cortical pattern. Impairment of accommodation and visual acuity has been reported rarely. After excessive dosage for weeks or months, withdraw gradually (1 or 2 weeks) to avoid recurrence of pretreatment symptoms (insomnia, severe anxiety, anorexia). Abrupt discontinuance of excessive doses has sometimes resulted in vomiting, ataxia, tremors, muscle twitching and epileptiform seizures. Prescribe very cautiously and in small amounts for patients with suicidal tendencies. Suicidal attempts have resulted in coma, shock, vasomotor and respiratory collapse and anuria. Excessive doses have resulted in prompt sleep; reduction of blood pressure, pulse and respiratory rates to basal levels; and occasionally hyperventilation. Treat with immediate gastric lavage and appropriate symptomatic therapy. (CNS stimulants and pressor amines as indicated.) Doses above 2400 mg./day are not recommended.

Composition: Tablets, 200 mg. and 400 mg. meprobamate. Coated Tablets, WYSEALS® EQUANIL (meprobamate) 400 mg. (All tablets also available in REDIPAK® [strip pack], Wyeth.) Continuous-Release Capsules, EQUANIL L-A (meprobamate) 400 mg.

Wyeth Laboratories Philadelphia, Pa.

Equanil®
(meprobamate) Wyeth®

Man in space, now fait accompli, re-emphasizes the importance of Uro-Phosphate therapy. Research into the effect of space travel on the astronaut reveals that weightlessness causes loss of bone calcium. As the bones are required to bear less and less of the weight of the body they lose calcium, increasing the calcium content of the urine. When physical activity is reduced, the acidity of the urine should be adjusted to keep increased calcium in solution . . . . a prophylaxis to prevent kidney or bladder calculi.

Uro-Phosphate®

NOW A SUGAR-COATED TABLET

Each tablet contains: METHENAMINE, *300 mg.;* SODIUM ACID PHOSPHATE, *500 mg.*

Uro-Phosphate gives comfort and protection when inactivity causes discomfort in the urinary function. It keeps calcium in solution, preventing calculi; it maintains clear, acid, sterile urine; it encourages complete voiding and lessens frequency when residual urine is present.

Uro-Phosphate contains sodium acid phosphate, a natural urinary acidifier. This component is fortified with methenamine which is inert until it reaches the acid urinary bladder. In this environment it releases a mild antiseptic keeping the urine sterile.

Uro-Phosphate is safe for continuous use. There are no contra-indications other than acidosis. It can be given in sufficient amount to keep the urine clear, acid and sterile. A heavy sugar coating protects its potency.

Dosage:

For protection of the inactive patient 1 or 2 tablets every 4 to 6 hours is usually sufficient to keep the urine clear, acid and sterile.

2 tablets on retiring will keep residual urine acid and sterile, contributing to comfort and rest.

A clinical supply will be sent to physicians and hospitals on request.

Toward Control of Viral Infections of Man

Of the available approaches to the control of infections due to viruses, the greatest advances have been made in the development of vaccines, but other avenues are also open. Progress to date, and problems yet to be overcome, are reviewed.

There are today three possible approaches to the control of infection caused by viruses: immunologic (vaccines), host resistance (interferon), and chemical (drugs).

The most effective and economically efficient control procedure attempted to date is specific immunization by vaccines from either live or killed viruses. The latter may be made with adjuvants which enhance the immune response. Human immune globulins are of limited usefulness in the control of viral infections.

A brief review of some of the developments toward protection against viral infection follows:

Smallpox vaccine has been the foundation for the vaccination concept. With gradual improvement in its quality and purity, today this vaccine is bacteriologically sterile and its potency is preserved by drying.

The second viral vaccine to be developed was against rabies. Until recently it was a crude preparation, but propagation of the virus in cell cultures has made possible the production of highly purified killed-virus and attenuated live-virus vaccines for experimental use.

MAURICE R. HILLEMAN, PHD *Science* (Vol. 164, No. 3879), May 2, 1969.

The yellow fever virus is the only one of 230 arboviruses that has yielded satisfactorily to vaccine control.

Influenza A & B in the early 1940's were the first of the respiratory virus vaccines. Influenza vaccine may effect a reduction in illness of 75% to 90% or more. However, a near-total antigenic alteration tends to occur in influenza A virus about every ten years and renders the previous vaccine useless. An urgent need is for a vaccine that provides protection against a number of viral strains.

The live-virus approach against respiratory syncytial virus has been explored, but to date attenuation of the virus has been inadequate.

Polio Vaccines

Reduction of poliomyelitis to insignificant levels in many countries speaks for the effectiveness of both live- and killed-virus vaccines. Live vaccine has many advantages, but low effectiveness has been reported in some tropical areas where improved living conditions have delayed the child's first experience with the virus to an older age than formerly. Continuing infection of the enteric tract with a multiplicity of indigenous enteroviruses may interfere with vaccination by preventing growth of the vaccine strains.

Work on vaccines for the three myxovirus infections of childhood—measles, mumps, and rubella—is in progress. Extensive and proper administration of vaccines against these diseases should result in their near elimination from the United States within a few years.

With the availability of new viral vaccines and the expectation of others in the near future, methods must be developed to simplify administration and to reduce costs.

The use of adjuvants should make it possible to achieve a greater and longer-lasting immunity with a smaller antigenic mass and fewer doses than with aqueous material.

Host Resistance

For more than three decades it has been known that infection with one virus may limit or exclude infection with a second, unrelated virus. This is called the interference phenomenon, which has been shown to be mediated by a protein of low molecular weight, called interferon. It is produced by virus-infected cells and protects new and uninfected cells from viral infection. Thus, interferon, rather than the conventional antibody immune mechanisms, may be responsible for recovery from viral infections in its early stages.

Though active to some degree in experimental tests, interferon prepared in cells outside the body has not achieved practical importance. The alternative approach is use of a safe and effective substance to stimulate the body to produce and distribute its own endogenous interferon. No substance so far tried has as yet proved satisfactory.

Recent research has led to the discovery that certain double-stranded ribonucleic acids are highly active in inducing interferon and host resistance both in animals and in cells in culture. Possibly the presence of a form of viral ribonucleic acid provides an "alert" or "alarm" reaction in the cell, causing it to make interferon.

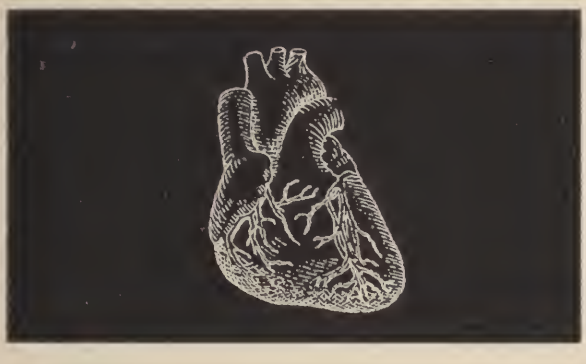
The possibility of using interferon inducers in human and animal medicine is being actively explored. The interferon mechanism, with its broad spectrum of antiviral activity, gives hope for eventual prophylactic control of those viral infections in which the number of serotypes is too great to control by vaccines. An example is the common cold.

Intensive search for chemical substances for preventing or treating viral diseases have not thus far been rewarding. Vaccines and interferon are prophylactic and do little to aid the cell once it is infected. At present the best hope for the cure of viral infection seems to rest on the chemical approach.

Research in viral chemotherapy has not yet achieved the status of an exact science, hence random screening as well as rational approaches will probably continue to be used. Studies may not be limited to compounds which are nontoxic for cells; rather, the specific antiviral and anticellular activities of a number of substances may be defined in the hope that this may lead to synthesis of nontoxic antiviral compounds on a rational basis.

Team Play Needed

The development of any measure for the control of viral disease, whether it be by immunological, chemical, or host-resistance procedure, is necessarily a slow and painstaking process for which a sophisticated technology must be evolved and a large body of information accumulated. The over-all achievement requires the cooperative team play of a wide variety of disciplines, including at least the fields of virology, cell biology, biochemistry, biophysics, pathology, clinical medicine, epidemiology, and applied biology, and, of course, a large outlay of funds.



It is possible that viruses may play a role in the vast majority of the illnesses of mankind. The degree to which viral vaccines may prevent such illnesses remains to be seen. Meantime, it seems possible that widespread use of existing and yet-to-be-developed vaccines may eliminate, or reduce, the future incidence of illnesses in which a viral role is not even suspect at present.

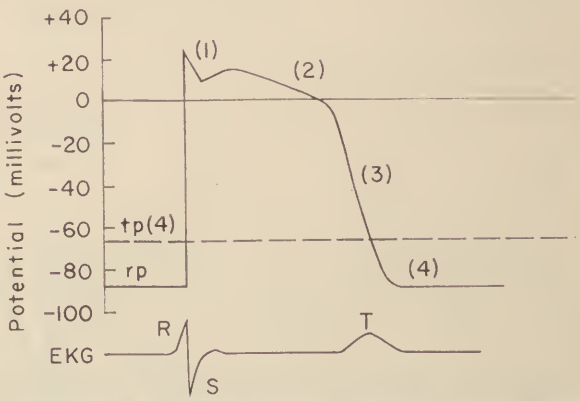
Part 1:

The Electrocardiogram in Clinical Alterations of Potassium Homeostasis

RALPH WEBER, MD
Baltimore



The electrocardiogram (EKG) has generally been more readily available than the flame photometer in the assessment of altered clinical states of potassium (K^+) homeostasis. EKG changes are thought to be a reflection of the sum total of a number of ionic influences at the level of the myocardial cell membrane. Because of this fact, the EKG has often been a more accurate index as to how serious a threat to life altered [K^+] may be than actual chemical determinations of serum K^+ levels. Numerous clinical and experimental observations reveal that the EKG changes of variations in [K^+] can be reproduced or corrected by altering the extracellular [K^+] with a rapidity that seems to exclude intracellular [K^+] as a factor of primary importance. The normal ratio of intracellular to extracellular K^+ is about 30:1. This transmembrane ratio or "gradient" is frequently altered during clinical states associated with changes in the EKG. However, the intracellular myocardial [K^+] is relatively stable under a variety of experimental conditions so that it seems reasonable to conclude that the extracellular [K^+] is the major determinant of the potassium gradient across the myocardial cell membrane.

Potassium intoxication and depletion are more precise terms than hyper- and hypokalemia since alterations attributable to a given clinical state are discussed rather than an isolated serum potassium value. Discussion of the EKG within this clinical framework will not include a variety of experimentally induced preparations or less common artificially induced states (as hemodialysis with fluid containing insufficient K^+) but will be limited to the two designated clinical states as commonly encountered in practice. In general, depletion is usually of a relatively gradual onset (except in familial periodic paralysis), and is much more common than intoxication, although the electrocardiographic changes are much less dramatic. Depletion results from excessive elimination or inadequate intake, conditions associated with abnormal potassium transfer, or combinations of these factors, and most often occurs in association with diuretic therapy. Intoxication is associated with rather striking electrocardiographic changes and almost always occurs in association with transient or permanent renal impairment, from excess administration or formation of potassium (both of which may be of sudden onset as with acute hemolysis in mismatched blood transfusions, crush syndrome, CCl_4 poisoning) decreased renal excretion or combination of these factors. Both intoxication and depletion may be seen during the treatment

of diabetic acidosis (where a large total body potassium deficit is present). When a patient is acidotic and dehydrated, serum K^+ is increased and the EKG suggests K^+ intoxication. During therapy with fluids and insulin, serum K^+ decreases and the EKG suggests K^+ depletion. The EKG sequence of K^+ depletion supervening upon K^+ intoxication has also been observed when a brisk diuresis has followed a period of renal shutdown.

Some general consideration of the relationship between the transmembrane potential (so called monophasic action potential, MAP) of non-specialized myocardial fibers and the surface EKG is useful. According to Hodgkin's ionic theory the membrane permeability to K^+ (and to a lesser extent, Na^+) are the major determinants in this action potential (MAP). MAP is generally divided into several phases (Fig. 1). Phase 0 denotes the rapid upstroke which is thought due to altered permeability of the cell membrane to Na^+ and associated with rapid influx of Na^+ into the cell. Repolarization begins promptly with a short spike designated as phase 1. Phase 2 denotes the slow plateau—like part of repolarization and the plateau configuration is attributed to the interaction of membrane permeability to both Na^+ and K^+ so that little actual electrical potential change occurs. Phase 3 is a more rapid stage of a repolarization which occurs as the membrane becomes more permeable to K^+ with an associated rapid efflux of K^+ from the cell. Phase 4 is the "recovery" phase during which Na^+ (which had previously entered the cell) leaves and K^+ returns. A unique property of specialized cardiac tissue (possessing automaticity) is the occurrence of spontaneous slow "diastolic depolarization" during this period of "electrical diastole." In general, phases 0-1 correspond roughly to the QRS of the surface EKG, phase 2 corresponds to the ST segment and phase 3 to the T wave of the surface EKG. The early portion of phase 4 corresponds to the U wave (probably largely resulting from repolarization of Purkinje fibers).

In observed clinical states of altered K balance, EKG changes of greatest diagnostic significance are generally first discernible on those portions of the tracing inscribed during repolarization (ST and T associated with phases 2, 3 of MAP) and, especially with depletion, phase 4 (MAP). If the configuration and duration of the QRS remains unchanged alterations in the ST and T segments are generally considered "primary." In general, alterations in the QRS are evident in association with more severe $[K^+]$ derangements and are more dependent on less well understood factors such as conduction velocity. Conduction velocity also varies in different locations of the heart. Although variation in extracellular K^+ affects all cardiac cells in the same general direction, a differential sensitivity exists in various types of cardiac tissues. Certain specialized cardiac fibers (i.e., SA node, some specialized atrial internodal conduction paths, N - H region of AV nodal tissue and Bundle of His) are more resistant to changes in K^+ than others (Purkinje fibers). Within the non-specialized cardiac tissue (muscle fibers) ventricular myocardium appears more resistant to $[K^+]$ than atrial myocardial fibers.

Relationship of transmembrane potential (above) and EKG (below). (after Hoffman and Cranefield)

BYLAWS COMMITTEE

Semiannual Meeting, September 1969

Mr. President and Members of the House of Delegates:

The Bylaws Committee met on Wednesday, June 18, 1969, to consider the recommitment of a proposed bylaw amendment, together with a pending amendment at the time of recommitment. The proposed amendment and the pending amendment read as follows:

Substitute for Article IV, Section 3, the following new section which reads as follows:

Section 3. One-third of the COUNCILORS provided below shall be elected annually by the House of Delegates from among the active members of component societies comprising the following districts:

(a) Western District: Allegany, Garrett, Carroll, Frederick and Washington Counties
(b) Eastern District: Caroline, Cecil, Dorchester, Kent, Queen Anne's, Somerset, Talbot, Wicomico and Worcester Counties.
(c) Central District: Baltimore City, Baltimore and Harford Counties
(d) Southern District: Anne Arundel, Calvert, Charles, Howard and St. Mary's Counties
(e) South Central District: Montgomery and Prince Georges Counties

Representation shall be on the basis of one Councilor from each district, plus one additional councilor for each 200 active and 40 year members in good standing on December 31 of each year.

*A COMPONENT SOCIETY IN THE CENTRAL AND SOUTH CENTRAL DISTRICTS SHALL BE ENTITLED TO BE REPRESENTED ON THE COUNCIL AS NEARLY AS MAY BE POSSIBLE BY ONE COUNCILOR FOR EACH 200 ACTIVE AND 40 YEAR MEMBERS IN GOOD STANDING OF SUCH COMPONENT SOCIETY ON DECEMBER 31 OF EACH YEAR.

*Pending amendment at time of referral.

All members of the Bylaws Committee were present for this meeting, consisting of Arthur E. Cocco, MD, Dewitt E. DeLawter, MD, Vincent J. Fiocco, Jr., MD, and Charles F. O'Donnell, MD, Chairman. Also present were Mr. Thomas Young, office of the Faculty's legal counsel; Mr. William J. Evans, Faculty Parliamentarian; and Mr. John Sargeant, Executive Secretary.

Discussion centered around the advisability of approving the proposed, pending amendment and whether or not this would restrict unduly the actions of the House of Delegates in the free election of Councilors to represent and act on behalf of the House during the interim between sessions of the House of Delegates.

It was determined that acceptance of the proposed pending amendment would do just this, and in addition, would be extremely difficult to administer because of nominations from the floor which are now accepted on the basis of district representation.

It was also felt that the House of Delegates could be trusted to exercise its discretion in ensuring that adequate representation of the components in each district is provided; and that the fears expressed at the Annual Session of the House of Delegates were unduly exaggerated.

The Bylaws Committee recommends that the pending amendment proposed on behalf of the Baltimore City Society be rejected and that the proposed Bylaw amendment be adopted with the following amendments:

(1) Amend the first paragraph after the word "active" by inserting the words "and 40 year members".
(2) Amend the final paragraph after "200" and before the word "Active", by inserting "or major fraction thereof".
(3) Amend the final paragraph before the words "December 31" by inserting "the preceding".

The Bylaws Committee presents the following additional Bylaw amendments for consideration of the House of Delegates:

Amend Article IV, Section 1, by striking out the figures "22"

OLD (Brackets indicate deletion)	*NEW* (Underlined portion additions)
Section 1. THE ELECTIVE OFFICERS shall be a President, a President-elect, a First, Second and Third Vice-President, a Secretary, a Treasurer and (22) Councilors.	Section 1. The Bylaws Committee also considered other matters at this meeting.

Throughout the Bylaws in Article XI—Committees, reference is made to members of the Baltimore City Dental Society serving on various Faculty committees. The Bylaws Committee has some reservations as to the advisability of their serving on some of these committees; and also questions whether or not such representatives should not be referred to as representing the Maryland State Dental Society.

The Council has been asked to name a special group to confer with the dental societies and discuss this further. Any proposed amendments will be considered at a later date and offered to the House of Delegates at an appropriate time.

The Bylaws Committee also carefully evaluated the various charges to Committees in the same Article XI. It has the following recommendations to make:

Amend Article XI, Section 11, by inserting the words, "and formulate guidelines" after the word "complaints."

OLD

(Brackets indicate deletion)

Section 11. *A MEDIATION COMMITTEE* composed of the five most recent living Immediate Past Presidents, not serving on the Commission on Medical Discipline and at least five additional members appointed by the President shall hear and determine all grievances or complaints involving or growing out of the practice of medicine as provided by these bylaws and mediate all problems involving or growing out of the practice of medicine. The chairman shall be appointed by the President. The Baltimore City Dental Society shall have the right to elect one associate member of the committee with voice but without vote in all committee deliberations except those relating to grievances or complaints.

NEW

(Underlined portion additions)

Section 11. *A MEDIATION COMMITTEE* composed of the five most recent living Immediate Past Presidents, not serving on the Commission on Medical Discipline and at least five additional members appointed by the President shall hear and determine all grievances or complaints and formulate guidelines involving or growing out of the practice of medicine as provided by these bylaws and mediate all problems involving or growing out of the practice of medicine. The chairman shall be appointed by the President. The Baltimore City Dental Society shall have the right to elect one associate member of the committee with voice but without vote in all committee deliberations except those relating to grievances or complaints.

Amend Article XI, Section 14, by adding an additional sentence which reads as follows:

"The tenure of office for this Committee shall be for one year and shall commence at a time that is mutually agreeable with the Maryland State Bar Association, so as to ensure that individual members shall serve conjointly with their respective counterpart members."

OLD

(Brackets indicate deletion)

Section 14. *A MEDICOLEGAL COMMITTEE* shall join with the corresponding committee of the Maryland State Bar Association, composed of an equal number, for the consideration of problems common to, or of concern to, both the medical and legal professions. Its chairman shall be appointed by the President and said chairman shall appoint the other members of the committee with the approval of the President.

NEW

(Underlined portion additions)

Section 14. *A MEDICOLEGAL COMMITTEE* shall join with the corresponding committee of the Maryland State Bar Association, composed of an equal number, for the consideration of problems common to, or of concern to, both the medical and legal professions. Its chairman shall be appointed by the President and said chairman shall appoint the other members of the committee with the approval of the President. The tenure of office for this Committee shall be for one year and shall commence at a time that is mutually agreeable with the Maryland State Bar Association, so as to ensure that individual members shall serve conjointly with their respective counterpart members.

Amend Article XI, Section 15 by striking out the entire section.

OLD

(Brackets indicate deletion)

(Section 15. The President shall appoint *A MEMBERSHIP COMMITTEE* of at least three active and at least two associate members which shall consider the rights and classes of membership; make recommendations to the component societies regarding methods of recruiting new members, and arrange memorials or tributes to deceased members. The President shall designate the chairman.)

NEW

(Underlined portion additions)

NONE

Amend Article XI, Section 17, by substituting a proposed new section which reads as follows:

Section 17. *AN OCCUPATIONAL AND ENVIRONMENTAL HEALTH COMMITTEE* of at least five members shall study and report as it deems advisable upon occupational and environmental health matters. It shall consider such subjects as occupational health problems in industry; consumer protection matters such as food, drugs, etc.; hazardous substances, such as poisons, toys, devices, etc.; the quality of the health environment such as water and air pollution and land use, etc.; as well as traffic safety, such as warning devices, highway signs, automobile construction, accident evacuation, first aid training, etc.

Its chairman shall be appointed by the President and said chairman shall appoint the other members of the committee with the approval of the president.

OLD

(Brackets indicate deletion)

(Section 17. *AN OCCUPATIONAL HEALTH COMMITTEE* of at least five members shall study and report as it deems advisable upon occupational disease programs and health programs in industry. Its chairman shall be appointed by the President and said chairman shall appoint the other members of the committee with the approval of the President.)

NEW

(Underlined portion additions)

Section 17. *AN OCCUPATIONAL HEALTH COMMITTEE* of at least five members shall study and report as it deems advisable upon occupational and environmental health matters. It shall consider such subjects as occupational health problems in industry; consumer protection matters such as food, drugs, etc.; hazardous substances, such as poisons, toys, devices, etc.; the quality of the health environment such as water and air pollution and land use, etc.; as well as traffic safety, such as warning devices, highway signs, automobile construction, accident evacuation, first aid training, etc.

Its chairman shall be appointed by the President and said chairman shall appoint the other members of the committee with the approval of the President.

Delegates to the AMA House of Delegates
Annual Session, New York City,
July 13 through 17, 1969

Mr. President and Members of the House of Delegates:

The Faculty's three delegates and alternates attended the 1969 annual meeting of the AMA's House of Delegates. Business considered at this session included 59 reports from the AMA Board of Trustees, the Executive Vice-President and standing and special committees of the AMA House. In addition, over 130 resolutions of major and minor importance were presented for consideration.

As is usual, all items of business were referred to various Reference Committees presenting an opportunity for individual AMA members and others to present their viewpoints on the subjects under consideration. Each of the delegates and alternates was assigned to a reference committee hearing and a cross exchange of information and summaries of the discussions taking place at these open meetings enabled the voting delegates to better understand and reach a decision on the Reference Committee reports presented to the House of Delegates for action.

The House heard comments from the Vice-President of the United States, Spiro T. Agnew, and also from the new Assistant Secretary of Health, Education and Welfare of the United States, who is assigned to Health and Scientific Affairs activity. Roger O. Egeberg, MD, was received cordially by the House and commented briefly on the health care system in the United States.

Following is a summary of the actions of the House of Delegates in capsule form. Full details may be obtained from the Faculty office, or from any of the Faculty's Delegates to the AMA House.

AMA Membership for Osteopaths

In response to a House directive at the Clinical Convention, 1968, that qualified osteopaths be admitted to full active membership in the AMA, the House amended the first paragraph of Chapter I, Section 1 of the Bylaws as follows:

> (A) Regular Members—Regular membership shall be limited to those members of a state medical association who hold the degree of Doctor of Medicine or Bachelor of Medicine, or who hold an unrestricted license to practice medicine and surgery, and are entitled to exercise the rights of membership in their state medical associations, including the right to vote and hold office, as determined by their state medical associations.

This was in response to the resolution introduced at the 1968 Clinical session by Maryland's delegation, calling for such a Bylaw change.

Scientific Sections

The Ad Hoc Committee to Study the Modus Operandi of the Scientific Sections reported its belief (which the House adopted) that the AMA can achieve greater unity within the medical profession and further strengthen its scientific program by inviting the national medical specialty societies to play a more active and responsible role and giving those societies a privilege of participating in the selection of section delegates in the AMA House and other section officers.

The scientific assembly will be divided into these specialty sections:

Allergy
Anesthesiology
Clinical Pharmacology and Therapeutics (formerly Experimental Medicine and Therapeutics)
Colon and Rectal Surgery
Dermatology
Diseases of the Chest
Family and General Practice (formerly General Practice)
Gastroenterology
General Surgery
Internal Medicine
Military Medicine
Obstetrics and Gynecology
Ophthalmology
Orthopedic Surgery
Otorhinolaryngology
Pathology (formerly Pathology and Physiology)
Pediatrics
Physical Medicine and Rehabilitation (formerly Physical Medicine)
Preventive Medicine
Psychiatry and Neurology (formerly Nervous and Mental Diseases)
Radiology
Special Topics
Urology

AMA Bylaws, Chapter VII, Sections 3-9, are to be rewritten to effect these changes, among others.

Each section will establish a section council. After the 1970 Clinical Convention, medical specialty societies will be invited to help form section councils.

Membership of the section councils "shall be selected by the national specialty societies listed in the American Medical Directory apportioned on the basis of the number of AMA members belonging to each specialty society and one member to be elected by the scientific section from the section membership."

At the 1971 Annual Convention, establishment of AMA section councils will be reported to each specialty section. The councils become effective January 1, 1972.

All section councils will be under the direction of the Board of Trustees and will be governed by rules established by the Board and approved by the House.

Reference Committee A

Cost of Care

The House stated that "The physician's influence on the costs of health care will be in proportion to his conscious efforts to adhere to practices which conserve the resources of his patient. As the provider of medical service, the doctor has a significant and responsible role in any organized effort to control health care expenditures. In this role, the physician has a challenge to maintain and improve a system that best serves the public and is most acceptable to him and to the profession of which he is a part."

Medicare and Medicaid

In connection with reducing medicaid costs, the House adopted a report listing four action programs of the profession: *expanded peer review programs* by county medical societies to reduce hospital and nursing home care and to *expand ambulatory care; eradication* by the profession of *isolated abuses* by physicians; promotion of innovative health service delivery systems for low income communities, with *emphasis on ambulatory care;* and

programs by local medical societies to *preserve quality of care* in the face of cost containment measures.

With respect to physician payment in teaching situations, the House resolved that the Board of Trustees "take action to evaluate and effect *improvement of the regulations in keeping* with the intent of Medicare and Medicaid in relation *to teaching situations.*"

On the subject of medicare fees and fee schedules, the House said, "While the AMA has not taken a specific position on the procedures relating to the development and application of physicians' fees profiles and prevailing charge screens, the actions which have been taken by the House would indicate that these concepts as defined through directives of the Social Security Administration, are not consistent with policies of the American Medical Association."

The House also said that since "Actions taken by DHEW to set rigid limits on levels of payments to physicians who provide services under Medicaid appear in contradiction to Congressional intent that Medicaid patients receive care on the same basis as private patients," it resolved that the AMA "urge a re-assessment by Congress of its intent and priorities in relation to Title XIX."

Regarding the isolated abuses of government programs, the House resolved that the Board's "efforts to obtain access to information referable to alleged misuse of any programs of health care be commended" but added that "In the *publicizing of charges* without the availability of reasonable and specific facts concerning individuals, the result is detrimental to the best interests of American medicine."

Voluntary Health Insurance

The House adopted a report urging that state medical associations, county societies and physicians individually direct "unstinting effort" to promote the proposed program of income tax credits for financing health care and "publicize the advantages inherent in this approach to preserve and strengthen the voluntary system."

Delegates also resolved that the AMA "encourages the development of prepayment medical insurance programs in which the *payment* to the physician is *based upon the usual, customary or reasonable fee concept*" and that "any reference to 'paid-in-full' coverage clearly identify those services which are indeed covered on a 'paid-in-full' basis and also identify the circumstances under which those services must be rendered."

Billing Procedures

"To ensure the continuance of the one-to-one physician-patient relationship," the House stated, "the profession considers direct billing preferable—identifying Medicare primarily as a financial aid to the patient. As long as Medicare holds to a realistic assessment of 'reasonable charges,' there will be comparatively few instances when direct billing entails greater out-of-pocket payment by the patient than does assignment."

Peer Review

This statement was adopted by the House: "The Council on Medical Service knows of no greater challenge facing the profession today than to secure universal acceptance and application of the (peer) review concept as the most meaningful method for creating a public awareness of medicine's efforts to assure high quality of health services at a reasonable cost."

Comprehensive Health Planning

The House said, about comprehensive health planning, that "Certainly, physicians and their professional organizations must accept the responsibility of working in the planning group throughout all stages of planning in order to provide guidance in choosing goals and programs that will realistically meet the community's needs;" and further resolved that "financial reimbursement for health care be based on the adequacy, competency and efficiency of patient care and not on the basis of approval by any regional planning agency."

Reference Committee B

Medical Care as a Right

To make its position clear in the long-standing discussions of medical care as a right, the House resolved that it "reaffirm its position (1) that it is a basic right of every citizen to have available to him adequate health care; (2) that it is a basic right of every citizen to have a free choice of physician and institution in the obtaining of medical care; and (3) that the medical profession, using all means at its disposal, should endeavor to make good medical care available to each person."

Government Reports

The House resolved that "the American Medical Association make every effort to secure appropriate payment to physicians for complex and detailed reports prepared for use by governmental agencies." This resolution does not affect the 1965 Judicial Council opinion that simplified insurance forms be completed without charge.

Extended Care

Because of the higher cost of hospitalization, the House resolved that the AMA "be urged to seek changes in the medicare law *to allow direct admission* to extended care facilities when eligible patients' conditions require less than acute hospital care."

Reducing Paper Work

Recognizing the avalanche of paper that threatens to inundate physicians, the House resolved that the AMA and state medical associations "undertake new discussions with governmental agencies, insurance companies and hospitals with the objective of achieving substantial reductions in the amount of paper work—hopefully amounting to at least a one-half decrease—and thus reducing the cost of health care and enabling physicians to devote the maximum time and effort possible to the care of patients."

Reference Committee C

Private Practice

A resolution that the AMA "establish a Council on Private Practice, with the primary objective being to espouse the aspirations and goals of private practice" was adopted by the House and referred to an ad hoc committee to be appointed by the Speaker of the House.

Federal Support of Medical Schools

In a change of House policy regarding federal loans to medical students, a joint report of the Board of Trustees and the Council on Medical Education was approved which calls for an increase in financial support of medical schools by the federal government to permit a major increase in the enrollment of medical students and the production of physicians. The change was considered justified because of current fiscal conditions which make it increasingly difficult for students to obtain loans from the private sector as a result of high interest rates and a restricted supply of money for personal loans.

Relicensure

The House approved a report recommending that "the physician's continued competency to provide quality health services be maintained by every practical means available; that a relicensure program not be considered at this time; that peer group evaluation be continually utilized and improved; that methods of improving the availability and the content of continuing education programs be continually investigated and refined; that additional incentives be positive in nature and come from within the profession."

Educational "Essentials"

The House approved essentials of an accredited educational program in nuclear medical technology; revision of essentials of approved residencies in thoracic surgery, neurology, anesthesiology and general requirements, revision of essentials of approved internship to provide for participation of osteopaths; revision of essentials of approved residencies pertaining to osteopaths; and essentials of an accredited educational program for medical assistants.

Reference Committee D

Health Care of the Poor

The House adopted the report of the Board of Trustees' Committee on Health Care of the Poor, which reiterated "our strong commitment toward expanding nationwide programs to improve the health of the poor" and stated that "the same quality of medical care should be accessible to all people."

The committee listed "certain concepts that we believe must be included in the Association's program:" (Paraphrased and condensed.)

1. Providing comprehensive health care to the poor is a desirable goal.
2. It must be a continuing program, identifying both short-range and long-range activities.
3. The committee's purpose must be to implement the research that has been done on unmet needs for health services.
4. Program must provide for participation of the poor in planning projects for their communities.
5. Physicians should work with numerous other organizations, both in and out of the health field, that have expressed concern about improving health care of the poor.

The committee concluded by stating that it "recognizes that the problems for which it hopes to find solutions are too critical and too complex for superficial, cursory answers. It believes that dynamic action in this field must have a top priority in the American Medical Association's activities."

Physicians and Hospitals

Most items considered by this Reference Committee had to do with physicians, hospitals and the JCAH.

For example, the House resolved that "the AMA Commissioners to the JCAH urge the Joint Commission to insure that that body which carries out the governing function of *the medical staff shall be representative of the medical staff, both hospital-based and voluntary,* and that this body shall advise the governing board of the hospital on policy regarding medical judgment and skill and on matters relating to the bylaws, rules and regulations of the medical staff."

The House also resolved that the AMA urge the JCAH "to give approval to effective staff and section meeting structures *which combine two or more hospitals* with overlapping medical staffs within a logical geographical area."

Reference Committee E

Full Disclosure of Laboratory Billing

The House adopted a Judicial Council report, "Review of Ethical Considerations Relating to Clinical Laboratories," which ended with this paragraph: "Where it is necessary for the attending physician to bill his patient for services performed by a clinical laboratory, the bill submitted by the attending physician to his patient should state the name of the clinical laboratory performing the services for his patient and state the exact amount of the laboratory charge paid or to be paid by the physician to the clinical laboratory."

Also adopted was the resolution that the "attending physician is entitled to fair compensation for the professional services he renders. He is not engaged in a commercial enterprise, however, and any markup, commission or profit on the services rendered by a laboratory is exploitation of the patient."

Blood Donors

The House encouraged "state medical associations to actively promote state legislation to provide that persons age 18 or over may donate blood without the necessity of parental permission or authorization and without restriction to voluntary or non-compensatory blood donation programs."

Prescription Labeling

Two resolutions concerning the labeling of prescriptions were referred to the Board of Trustees and the Council on Legislative Activities, after being adopted by the House. One recommends legislation requiring labeling; the other encourages labeling.

Reference Committee F

Financial Report

The AMA's financial statement for the year ending June 30, 1969, was approved and the House then resolved that "the Finance Committee of the Board of Trustees meet in advance of each Annual Convention with the Reference Committee to which the annual Financial Statement will be referred for presentation and discussion of more detailed budget and financial data of the Association, so that the Reference Committee will be able to make a more meaningful evaluation for the House of Delegates."

AMA Management Survey

The House adopted the management survey report of Cresap, McCormick and Paget and approved the analysis of communications made by the Philip Lesly Company.

In connection with the former, the House approved the Reference Committee's list of eight subjects to which "the highest priorities in activities and programs should be assigned:"

1. The rising cost of health care.
2. The expansion of out-of-hospital health services.
3. The development of community health centers.
4. Experimentation and innovation on new methods of delivery of health services.
5. Medical audit, utilization and review committees.
6. Medical manpower needs.
7. Preventive medicine.
8. Family planning.

The House also requested that the Board of Trustees (1) develop program priorities; (2) outline specific techniques of resolving the problems caused by those priority programs; and (3) report to the House at each semi-annual session on progress being made.

State Projects of AMA

The House resolved that "financial support by the AMA for local or area health service projects should be preceded by consultation with the constituent association of the state or states in which the projects are to be conducted."

Professional Liability

In connection with professional liability, the House adopted the following statements as recommendations of the AMA:

1. First, that constituent associations "seek the enactment of appropriate state legislation designed to provide a more efficient and equitable determination of malpractice claims and litigation."
2. Second, that state associations, with the help of AMA, "seek the cooperation of hospital associations and third party payers in exploring and developing, if feasible, pilot programs which will provide scheduled benefits for persons injured as a consequence of medical accidents occurring in the delivery of health care, irrespective of fault."
3. Third, "that workshops on malpractice insurance problems be conducted, as requested by the Board of Trustees, in which participation will be invited from (1) physicians confronted by insurance problems, (2) representatives of the insurance carriers, (3) staff attorneys of AMA and other appropriate staff personnel, (4) representatives of and attorneys for the hospital service field, (5) nurses and (6) legislators."

In addition, the House resolved that the AMA "should not attempt to establish a nationwide professional liability insurance program either by sponsorship of a program underwritten by an existing insurance carrier or by seeking to establish a new insurance carrier."

Reference Committee G

Sex Education

While recognizing "that the primary responsibility for family life education is in the home," the House supported "in principle the inauguration by State Boards of Education or school districts, whichever is applicable, of a voluntary family life and sex education program at appropriate grade levels:

"(1) as part of an overall health education program;
"(2) presented in a manner commensurate with the maturation level of the students;
"(3) following a professionally developed curriculum foreviewed by representative parents;
"(4) including ample and continuing involvement of parents and other concerned members of the community;
"(5) developed around a system of values defined and delineated by representatives comprising physicians, educators, and clergy and other appropriate groups; and
"(6) utilizing classroom teachers and other professionals who have an aptitude for working with young people and who have received special training."

Nursing

The House reaffirmed "its support of all forms of nursing education including baccalaureate, diploma, associate and practical nurse education programs" and encouraged "the continuation of federal, state and local subsidies to schools of nursing education."

Smoking and Health

The House resolved that the AMA "again urge its members to play a *major role against cigarette smoking by personal example* and by advice regarding the health hazards of smoking" and "discourage smoking by means of public pronouncements and educational programs." It also resolved to "indicate to the Congress of the United States the incongruity of the expenditure of tax dollars to promote the production and sale of tobacco while at the same time spending other tax dollars to discourage cigarette smoking because of its hazard to health."

Food Mixes

The House requested the U.S. Food and Drug Administration to "favorably consider the proposal of the Council on Foods and Nutrition regarding labeling of fatty-acid composition" of food mixes, and that the Council on Foods and Nutrition "undertake the development of a rational proposal for identifying and labeling other nutritionally significant components of convenience foods."

Protective Headgear

The Committee on the Medical Aspects of Sports was asked by the House "to continue its efforts to utilize and publicize existing research and recommendations on football helmets to assure optimum protection for players against impacts which cause head and neck injuries" and "to do everything possible to discourage the practice of 'spearing.' "

Reference Committee H

Highway Signs

A Board of Trustees report and a resolution were adopted recommending a uniform system of highway directional signs designating emergency medical facilities. However, the House pointed out clearly that "this action does not encourage or approve the use of the copyrighted AMA symbol for other unauthorized and unidentified programs."

Credit Cards

Two resolutions concerning the use of credit cards to pay for medical care were referred to the Judicial Council for information, "with the expectation that additional opinions will be rendered as experience accumulates." In certain states, the Reference Committee pointed out, a charge card system is under experimentation by the state medical society and is deserving of a chance to prove its merits. Also, the Judicial Council has ruled that the use of a charge card system should be flexible and at the discretion of the individual state medical societies.

Medical Instruments and Devices

Pointing out that legislation related to federal standards to regulate the use of medical instruments and devices was introduced in the 90th and 91st congresses, the House resolved that the AMA "be commended for its position supporting the concept of a thorough study of the field of medical instruments and devices prior to passage of specific regulatory legislation."

Unification Through AMA

The House resolved that the Board of Trustees be

asked to begin a study "of physicians who are not members of the AMA, and then make recommendations to the House of Delegates and to the State and County Societies, as to how the medical profession may more wisely unify itself under the AMA banner, and encourage non-participating physicians to join."

Presentations, Awards and Announcements

Robert E. Gross, MD, was presented the Dr. Rodman E. Sheen and Thomas G. Sheen Award. Dr. Gross is Ladd Professor of Children's Surgery at Harvard Medical School and director of cardiovascular surgery at Children's Hospital Medical Center, Boston.

Charles A. Berry, MD, medical director of the NASA Manned Spacecraft Center in Houston, was presented a plaque: "The American Medical Association presents this citation for distinguished service to Charles A. Berry, MD, and the medical staff of the Manned Spacecraft Center, NASA, at Houston, Texas, in recognition of their efforts in solving the difficult and complex problems of assuring the health and contributing substantially to the safety and survival of the astronauts participating in the United States space exploration program."

Stephan R. Chernay, MD, New York, received the first AMA recognition award for continuing education.

Executive Vice President E. B. Howard announced to the House the appointment of Richard Wilbur, MD, Calif., as Assistant Executive Vice President of the AMA. An Assistant Executive Vice President for Scientific Affairs also is to be named.

The medical winners in the 20th International Science Fair for high school students were introduced to the House and their exhibits were included among the scientific exhibits at the convention.

They were Cathy Jennemann, 16, a junior at Monte Cassino High School, Tulsa, Okla., whose exhibit was "Possible Deafness From Everyday Noise;" and Greg Kauffman, 16, a junior at Albuquerque (N.M.) High School, "Pyelonephritic Recurrence."

Student American Medical Association

Your Delegates met with and were interviewed by James Smith of the Univeristy of Maryland School of Medicine, and Charles Avery of the Johns Hopkins University School of Medicine who were in attendance during the AMA meeting. They were spending the summer on a grant supported by the U.S. Department of Health, Education and Welfare and the Office of Economic Opportunity, and investigating all aspects of the field of medicine other than scientific; i.e., socioeconomic, etc. Following the AMA meeting, both of these individuals will be working in a preceptorship with a United States Senator or Congressman, newspaper, or some other public activity.

Questions asked by these students were searching and pertinent. One had the feeling that "pat" answers were not blandly accepted. The Delegates were struck with an increased social awareness in the medical students of today which was not present in our era. The interviews were mutually stimulating and made one slightly uncomfortable in realizing that "stock" replies were often inadequate.

Interruption

The House suffered a 21-minute interruption during its opening session Sunday when 30 to 40 dissident medical students and their friends, seized the podium and demanded the right to address the House.

The news release they distributed identified them as representatives of the Student Health Organization, the Medical Committee for Human Rights, the Movement for a Democratic Society, the Health Policy Advisory Center, the Rockefeller University Committee for a Democratic Society "and many others."

The group's spokesman began by declaring the meeting "illegal and illegitimate" and ended by burning what he called his AMA membership card, but which television news described as a Blue Shield card.

He came back Wednesday with a "non-negotiable demand" for 10 minutes to speak during the inaugural ceremony, but was flatly refused by the Reference Committee on Rules and Order of Business.

The Effect of Urinary Diversion on Urinary Tract Disease in Patients with Spinal Cord Injury

FRANCIS J. BORGES, MD
Director, Department of Medicine
Montebello State Hospital
Associate Professor of Medicine
University of Maryland School of Medicine

ALAN Z. STEINBERG *
Junior Medical Student
University of Maryland School of Medicine

** Supported by the Maryland State Department of Health Summer Medical Student Program in Public Health, Project #1206.*

PAULO P. MENDONCA, MD
Research Associate in Surgery
Division of Urology
University of Maryland School of Medicine

Presented at the 16th Annual Medical and Dental Students Seminar of the Maryland State Department of Health, August 13, 1968.

Patients with traumatic injury to the spinal cord experience unique illnesses not commonly seen in the average medical-surgical community. The greatest causes of morbidity and mortality among these patients are renal failure, cardiovascular, pneumonia, cerebrovascular disorders, suicide, and gastrointestinal problems, in that order.[1] Of these problems, renal failure or genitourinary sepsis are by far the most common causes of death.[1, 2] Recent studies indicate that the average length of life in the quadriplegic-paraplegic is 20 years.[1] This average longevity has not appreciably improved between the years 1960 to 1967, nor has there been a significant reduction of renal failure as a cause of death during that time.[1, 2] Because of the prevalence of renal failure as a cause of death, it seems proper to evaluate those efforts directed toward maintaining renal function in these patients. Avoidance of obstruction to urinary flow and elimination of foreign body in the urinary tract are the cardinal principles involved in the prevention of urinary tract infection. Diversion of the urinary stream by means of the ileal loop is currently in vogue as a measure toward maintaining the aforementioned principles. It is the purpose of this study to evaluate the role of the ileal loop in preventing urinary tract infection and deterioration of renal function.

Procedure

From April 27, 1953 to December 31, 1967, 447 patients with quadriplegia or paraplegia secondary to spinal cord trauma were hospitalized at Montebello State Hospital, Baltimore, Maryland. During this time 44 (10%) patients have undergone a urinary diversion procedure, usually ileal loop, as described by Bormel and Galleher.[3] These patients are divided into three groups: 13 patients currently hospitalized, 20 discharged, and 11 patients who are deceased.

The patients considered in this study are the 13 currently hospitalized. This report is limited to this group because these patients have been under direct surveillance by one of us (F.J.B.) for two years, and because chronic hospitalization affords accurate observations as recorded on the patients' charts.

The data were compiled by a review and interview of the patient and his chart. In 9 of 13 instances the patient's hospitalization came under our surveillance for the entire course following their initial injury. All patients have had chronic hospitalization with the usual preliminary work up and serial intravenous pyelograms, cystograms, cystometrograms, urinalysis and urine cultures.

The incidence of urinary tract infection (UTI) was tabulated by using an infection-time ratio. This ratio was calculated by computing the number of infections per time in months and multiplying by 100 to eliminate fractions. The ratio was used to indicate the infection rate, and to eliminate differences in length of time of hospital course.

The following four questions were asked in an attempt to define the role of the ileal loop in preventing urinary tract morbidity and mortality:

1. **What were the indications for performing the ileal loop?**
2. **Were the indicated objectives achieved by the procedure?**
3. **Was the frequency of urinary tract infection altered?**
4. **What was the effect of this procedure on morbidity and longevity?**

Results

Table I describes the patients comprising this study. Of the total 13 patients, nine are men and four are women. At the time of their injury the average age was 30 years (with a range from 16 to 48). At the time of the ileal loop procedure, the average age was 34 years (range 16-57). The average length of follow-up, post ileal loop, was 29 months (range 4-96). There were nine quadriplegics and four paraplegics in this group. Eleven of the patients experienced spinal cord trauma, and two patients had their paralysis secondary to infectious polyneuronitis. Only one patient (A.B.) had a documented history of lower urinary tract infection prior to spinal cord injury.

Table II presents the indications for ileal loop listed by patient. Four patients—F.W., J.W., J.P., A.B.—had the ileal loop performed for chronic fistula; three men with a urethro-cutaneous fistula at the penile-scrotal junction (PSJ), and one woman patient with a urethro-vaginal fistula. Only one patient (A.B.) of these four also had accompanying radiologic changes suggestive of pyelonephritis. In another sub-group of four patients—M.R., J.H., J.D., E.H.—the primary indication for diversion was vesico-ureteral reflux (V-U), either bilateral or uni-

lateral. Three out of four in this group had changes indicative of pyelonephritis (caliectasis, blunting, forniceal rounding) in addition to the V-U reflux. A third sub-group of four patients—D.T., L.G., D.B., A.C.—underwent urinary diversion for persistent urinary tract infection. In this group, three of the four patients also had evidence of pyelonephritis. Patient J.L. received an ileal loop because of patulous urethra, spastic bladder, and evidence of chronic pyelonephritis in her left kidney.

Table III indicates the infection-time ratio for both the pre- and post-urinary diversion periods. In 12 of 13 patients the incidence of urinary tract infection was reduced. There was a mean decrease in the infection-time ratio from 59 (range 11-300) in the pre-diversion period to 7 (0-33) in the post-loop follow up period. In one instance the infection-time ratio increased from 5 to 11, however this particular patient could not be evaluated accurately due to the presence of two cutaneous ulcers during two separate febrile episodes with pyuria. Although fever and pyuria responded to urinary tract antibiotics, cutaneous ulcers may have caused a febrile response, and may have responded to antibiotics.

TABLE III

Pre- and Postoperative Infection-Time Ratio

The status of the urinary tract post-urinary diversion is shown in Table IV. The sub-group whose primary indication was V-U reflux could not be evaluated as to improvement, since the anatomy of the loop is such that free reflux usually occurs on ileogram. The remaining nine patients showed improvement of their primary indication for surgery.

The postoperative course was further evaluated on the basis of radiographic evidence of pyelonephritis and bladder complications. One patient, L.G., was not evaluated since no postoperative intravenous pyelograms were available. Of the 12 remaining patients, seven showed no change or improvement in the radiologic changes and five had evidence that this disease process had progressed. Nine of the 13 patients had their bladders remaining after construction of the ileal loop. Six of these nine patients subsequently developed pseudomonas bladder empyema during their postoperative course. The remaining three patients had sterile bladder excretions.

Summary

During its 15 years of service to the State of Maryland, 447 patients with spinal cord injury were hospitalized at Montebello State Hospital. Forty-four of these patients have undergone a urinary diversion procedure, usually ileal loop. This investigation was undertaken to answer the following four questions concerning the effectiveness of the ileal loop urinary diversion in altering urinary tract disease:

1. What were the indications for performing the ileal loop?
2. Were the indicated objectives achieved by the procedure?
3. Was the frequency of urinary tract infection altered?
4. What was the effect of this procedure on morbidity and longevity?

**pseudom.—pseudomonas
blad. —bladder
empy. —empyema

The group studied was limited to 13 patients currently hospitalized. Four patients in this group underwent an ileal loop diversion for the presence of a draining cutaneous fistula in the lower urinary tract, a second group of 4 patients had their operation to eliminate vesico-ureteral reflux, and a third group of 4 patients experienced recurrent episodes of urinary tract infection as the chief indication for diversion. The 13th patient had an ileal loop done because of a patulous urethra, spastic bladder and unilateral chronic pyelonephritis.

The results indicate that ileal loop diversion did serve as an effective remedy for the chief urinary tract problem in nine of nine (100%) patients evaluated. The remaining four patients could not be adequately evaluated since the main indication for diversion was the presence of vesico-ureteral reflux.

The frequency of urinary tract infection was effectively reduced in 12 of 13 patients. This was a mean reduction of urinary tract infection to one seventh of the pre-ileal loop diversion incidence. The radiographic evidence of pyelonephritis was either improved or remained stationary in 58% of the patients.

The authors waived evaluation of the effect on longevity until the whole group of 44 patients who received the ileal loop can be studied.

These results indicate that an ileal loop is effective in suppressing or improving urinary tract complications in selected paraplegic-quadriplegic patients.

heavenly relief
for unearthly cough

Benylin®
EXPECTORANT

Each fluidounce contains: 80 mg. Benadryl® (diphenhydramine hydrochloride, Parke-Davis); 12 grains ammonium chloride; 5 grains sodium citrate; 2 grains chloroform; 1/10 grain menthol; and 5% alcohol.

An antitussive and expectorant for control of coughs due to colds or of allergic origin, BENYLIN EXPECTORANT is the leading cough preparation of its kind. BENYLIN EXPECTORANT tends to inhibit cough reflex... soothes irritated throat membranes. And its not-too-sweet, pleasant raspberry flavor makes BENYLIN EXPECTORANT easy to take.

PRECAUTIONS: Persons who have become drowsy on this or other antihistamine-containing drugs, or whose tolerance is not known, should not drive vehicles or engage in other activities requiring keen response while using this preparation. Hypnotics, sedatives, or tranquilizers if used with BENYLIN EXPECTORANT should be prescribed with caution because of possible additive effect. Diphenhydramine has an atropine-like action which should be considered when prescribing BENYLIN EXPECTORANT.

ADVERSE REACTIONS: Side reactions may affect the nervous, gastrointestinal, and cardiovascular systems. Drowsiness, dizziness, dryness of the mouth, nausea, nervousness, palpitation, and blurring of vision have been reported. Allergic reactions may occur.

PACKAGING: Bottles of 4 oz., 16 oz., and 1 gal.

Parke, Davis & Company
Detroit, Michigan 48232

PARKE-DAVIS

Appearances may be deceiving

It may be tetracycline

but it's not ACHROMYCIN® V
Tetracycline HCl

unless it bears this signature.

250 mg. and 100 mg. capsules

Contraindications: Hypersensitivity to tetracyclines.
Warning: In renal impairment, since liver toxicity is possible, lower doses are indicated; during prolonged therapy consider serum level determinations. Photodynamic reaction to sunlight may occur in hypersensitive persons. Photosensitive individuals should avoid exposure; discontinue treatment if skin discomfort occurs.
Precautions: Nonsusceptible organisms may overgrow; treat superinfection appropriately. Tetracycline may form a stable calcium complex in bone-forming tissue and may cause dental staining during tooth development (last half of pregnancy, neonatal period, infancy, early childhood).

Side Effects: Gastrointestinal—anorexia, nausea, vomiting, diarrhea, stomatitis, glossitis, enterocolitis, pruritus ani. *Skin*—maculopapular and erythematous rashes; exfoliative dermatitis; photosensitivity; onycholysis, nail discoloration. *Kidney*—dose-related rise in BUN. *Hypersensitivity reactions*—urticaria, angioneurotic edema, anaphylaxis. *Intracranial*—bulging fontanels in young infants. *Teeth*—yellow-brown staining; enamel hypoplasia. *Blood*—anemia, thrombocytopenic purpura, neutropenia, eosinophilia. *Liver*—cholestasis at high dosage.

Upon adverse reaction, stop medication and treat appropriately.

symptoms of mixed anxiety-depression are rarely clear-cut..
but they are often a clear indication for

Mellaril®
(thioridazine)
25 mg. t.i.d.

effective in mixed anxiety-depression and in moderate to severe anxiety

Before prescribing or administering, see Sandoz literature for full product information, including adverse reactions reported with phenothiazines. The following is a brief precautionary statement.

Contraindications: Severe central nervous system depression, comatose states from any cause, hypertensive or hypotensive heart disease of extreme degree.

Warnings: Administer cautiously to patients who have previously exhibited a hypersensitivity reaction (e.g., blood dyscrasias, jaundice) to phenothiazines. Phenothiazines are capable of potentiating central nervous system depressants (e.g., anesthetics, opiates, alcohol, etc.) as well as atropine and phosphorus insecticides. During pregnancy, administer only when necessary.

Precautions: There have been infrequent reports of leukopenia and/or agranulocytosis and convulsive seizures. In epileptic patients, anticonvulsant medication should also be maintained. Pigmentary retinopathy may be avoided by remaining within the recommended limits of dosage. Administer cautiously to patients participating in activities requiring complete mental alertness (e.g., driving). Orthostatic hypotension is more common in females than in males. Do not use epinephrine in treating drug-induced hypotension. Daily doses in excess of 300 mg. should be used only in severe neuropsychiatric conditions.

Adverse Reactions: *Central Nervous System*—Drowsiness, especially with large doses, early in treatment; infrequently, pseudoparkinsonism and other extrapyramidal symptoms; nocturnal confusion, hyperactivity, lethargy, psychotic reactions, restlessness, and headache. *Autonomic Nervous System*—Dryness of mouth, blurred vision, constipation, nausea, vomiting, diarrhea, nasal stuffiness, and pallor. *Endocrine System*—Galactorrhea, breast engorgement, amenorrhea, inhibition of ejaculation, and peripheral edema. *Skin*—Dermatitis and skin eruptions of the urticarial type, photosensitivity. *Cardiovascular System*—Changes in the terminal portion of the electrocardiogram have been observed in some patients receiving the phenothiazine tranquilizers, including Mellaril (thioridazine). While there is no evidence at present that these changes are in any way precursors of any significant disturbance of cardiac rhythm, several sudden and unexpected deaths apparently due to cardiac arrest have occurred in patients previously showing electrocardiographic changes. The use of periodic electrocardiograms has been proposed but would appear to be of questionable value as a predictive device. *Other*—A single case described as parotid swelling.

Listing of Sources of Short-Term Training for Laboratory Workers

The Laboratory Consultation and Development Section of the National Communicable Disease Center is compiling a list of organizations which offer short-term training for persons working in clinical and public health laboratories. Academic training for full-time students will not be included. When completed, the list will be made available to all individuals interested in continuing education for medical laboratory personnel. The compilation will serve to alert training coordinators, supervisors and prospective students to the existence of many little-known sources of short-term training, some at no cost to the student.

Companies, professional associations, individuals, and schools who desire to furnish information for inclusion in the listing should write:

National Communicable
Disease Center

Attention:

Mr. John H. Krickel
Education Specialist
Laboratory Division
Atlanta, Georgia 30333

No information will be included in the published list without prior clearance from the organization or individual offering the training.

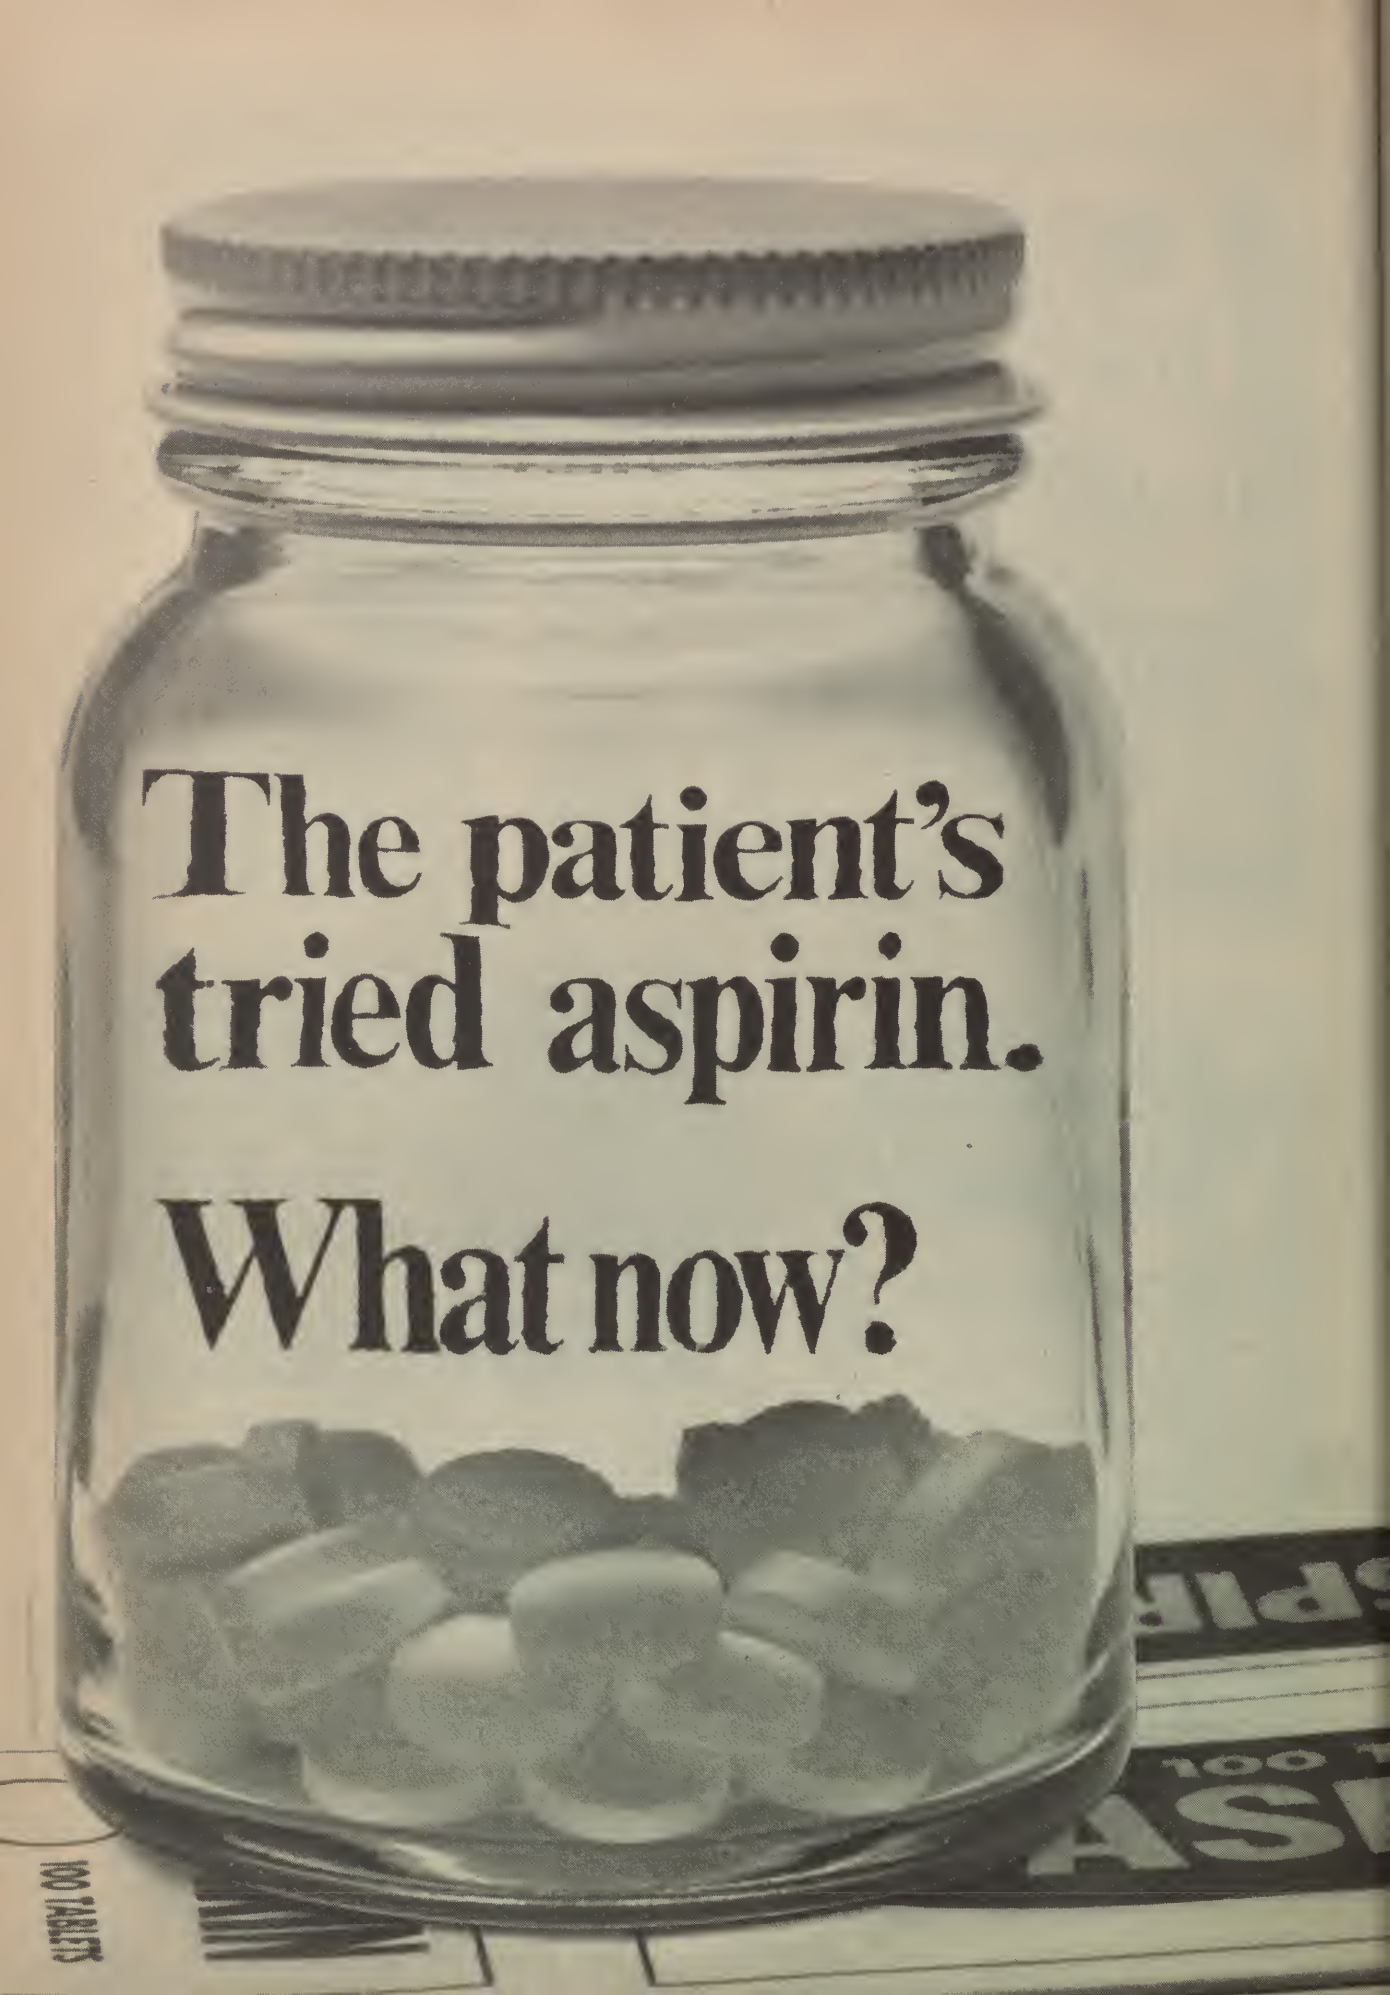
Since 1883, the most important phase of *Read's* services has been dispensing prescriptions—Because of this, our 2 *All-Nite* prescription service stores were established so that prescriptions could be filled not only during "waking hours", but also after midnight at these 2 All-Nite drug store locations—with complete drug store service around the clock.

TB is still around.



In 1967 almost 45,000 new active cases were reported. Isn't that a good reason to make tuberculin testing with the white LEDERTINE™ Applicator a routine part of your physical examinations?

TUBERCULIN TINE TEST
(Rosenthal) with Old Tuberculin

Precautions: With a positive reaction, consider further diagnostic procedures. Use with caution in persons with active tuberculosis or known allergy to acacia. Vesiculation, ulceration, or necrosis may occur at the test site in highly sensitive persons.

Lederle LEDERLE LABORATORIES
A Division of American Cyanamid Company, Pearl River, N.Y.

The patient's
tried aspirin.
What now?
100 TABLETS

There's a good chance your patient needs more than a non-prescription analgesic for pain relief. Especially after self-medication has failed.

Because continuing, increased pain and discomfort may in part be a reflection of anxiety, Equagesic is worthy of consideration. In a single, non-narcotic preparation, it helps relieve pain . . . *and* associated anxiety and tension.

Tablets

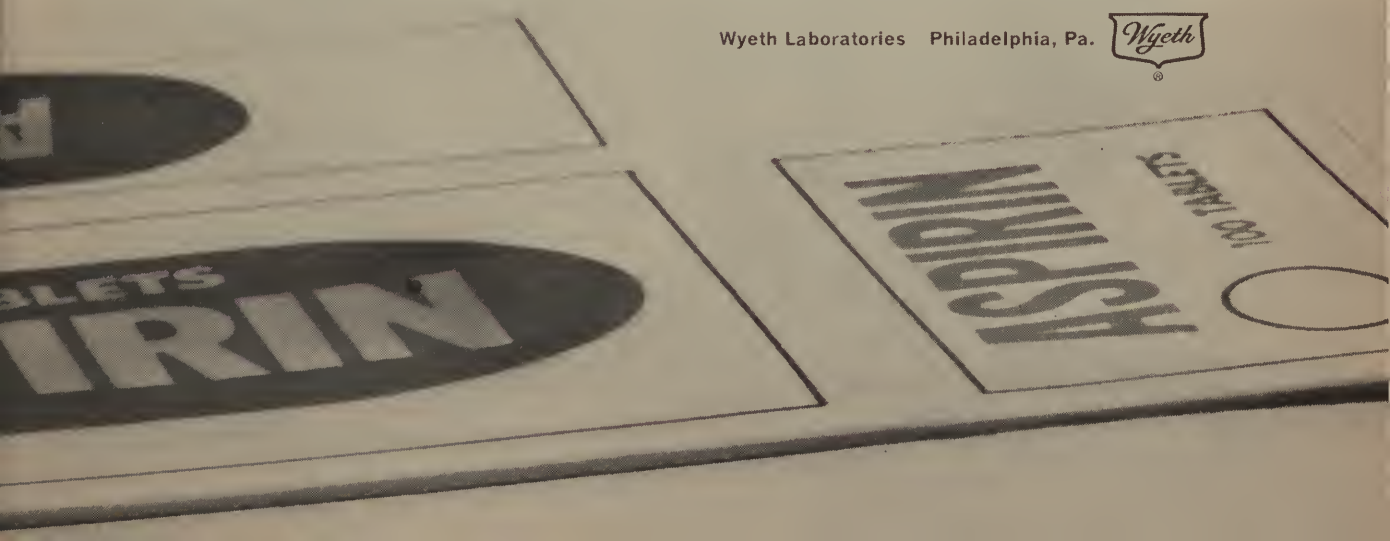
Equagesic®

(meprobamate and ethoheptazine citrate with aspirin) Wyeth

IN BRIEF

Contraindications: History of sensitivity or severe intolerance to aspirin, meprobamate or ethoheptazine citrate.

Warnings: USE IN PREGNANCY: Safety for use during pregnancy or lactation has not been established; therefore, it should be used in pregnant patients or women of child-bearing age only when the physician judges its use essential to the patient's welfare.



Precautions: Keep out of reach of children. Not recommended for patients 12 years old or less. Carefully supervise dose and amounts prescribed, especially for patients prone to overdose themselves. Excessive prolonged use of meprobamate in susceptible persons—as alcoholics, ex-addicts, severe psychoneurotics—has resulted in dependence or habituation. Withdraw gradually after prolonged excessive dosage to avoid possibly severe withdrawal reactions including epileptiform seizures. Warn patients of possible reduced alcohol tolerance, with resultant slowed reactions and impaired judgment and coordination. If drowsiness, ataxia or visual disturbances (impairment of accommodation and visual acuity) occur, reduce dose. If symptoms persist, patients should not operate machinery or drive. After meprobamate overdose, prompt sleep, reduction of blood pressure, pulse and respiratory rates to basal levels, and hyperventilation are reported. Give cautiously and in small amounts to patients with suicidal tendencies. Treat attempted suicide (has resulted in coma, shock, vasomotor and respiratory collapse and anuria) with gastric lavage and appropriate symptomatic therapy (CNS stimulants and pressor amines as indicated). Two instances of accidental or intentional significant overdosage with ethoheptazine and aspirin have been reported. These were accompanied by CNS depression (drowsiness and lightheadedness) but resulted in uneventful recovery. On basis of pharmacologic data, CNS stimulation could be anticipated, with nausea, vomiting and salicylate intoxication (requires induced vomiting or gastric lavage, specific parenteral electrolyte therapy for ketoacidosis and dehydration, and observation for hypoprothrombinemic hemorrhage [usually requires whole blood transfusions]).

Adverse Reactions: Ethoheptazine and aspirin may cause nausea with or without vomiting and epigastric distress in a small percentage of patients. Dizziness is rare at recommended dosage. Meprobamate may cause drowsiness, ataxia and rarely allergic or idiosyncratic reactions. These reactions, sometimes severe, can develop in patients receiving only 1 to 4 doses. Such patients may have had no previous contact with meprobamate and may or may not have an allergic history. Mild reactions are characterized by urticarial or erythematous maculopapular rash. Acute nonthrombocytopenic purpura with cutaneous petechiae, ecchymoses, peripheral edema and fever have been reported. If allergic reaction occurs, discontinue meprobamate; do not reinstitute. Severe reactions, observed very rarely, include fever, fainting spells, angioneurotic edema, bronchial spasms, hypotensive crises (1 fatal case), anaphylaxis, stomatitis and proctitis (1 case) and hyperthermia. These cases should be treated symptomatically including, when indicated, such medication as epinephrine, antihistamine and possibly hydrocortisone. A few cases of leukopenia, usually transient, have been reported on continuous use. Rarely, aplastic anemia (1 fatal case), thrombocytopenic purpura, agranulocytosis, and hemolytic anemia have been reported, almost always in presence of known toxic agents.

Overdosage: See precautions section for management of overdosage.

Composition: 150 mg. meprobamate, 75 mg. ethoheptazine citrate and 250 mg. aspirin per tablet.

Information for Authors

MANUSCRIPTS: Manuscripts will be accepted for consideration for publication with the understanding that they are original, have never before been published, and are contributed solely to the Maryland State Medical Journal.

All manuscripts are acknowledged upon receipt and are followed up by notification of either acceptance or rejection. Rejected manuscripts are returned by regular mail. Accepted manuscripts become the property of the Journal and are not returned. The Journal is not responsible for loss of manuscripts through circumstances that are beyond its control.

Manuscripts should be addressed to: Editor, Maryland State Medical Journal, 1211 Cathedral St., Baltimore, Md. 21201.

SPECIFICATIONS: Manuscripts must be original typed copy, doublespaced throughout (Including text, case reports, legends, tables and references) with margins of at least 1½ inches. Pages should be numbered consecutively.

The manuscript should include the title (brief and concise), the full name of the author (or authors) with degrees, academic and professional titles, affiliations, and any institutional or other credits. Please include a complete address where the author may receive proofs of his article for his approval and corrections.

All manuscripts should be accompanied by a carbon or Xerox copy and the author should retain another copy for his records.

TABLES: Each table should be typed on a separate sheet of paper, be numbered, have a brief descriptive title, and its position in the text should be indicated.

Be sure that statistics are consistent in both tables and text.

REFERENCES: References should be limited to those citations noted in the text, and kept to a minimum of 18. (A complete review of the literature is rarely desirable.) The references must be typed, doublespaced, and are to be numbered consecutively as they appear in the text, with their positions in the text indicated. An alphabetized bibliography is used only when the listing is of books suggested for supplementary reading.

All references must be checked for absolute accuracy. Each journal reference must include author(s) and initials, complete title of article, name of publication, volume, first page of article, and date. Complete dates (month, day, and year) are to be included with all references that have appeared within the last three years. Include with book references name of author(s) and/or editor(s) with initials, title of book, edition, location, publisher, year, volume (if given), and page. If reference is to a chapter within a book, include the author of the chapter (if different from author of the book), and the title of the chapter, if any.

ILLUSTRATIONS: Authors are urged to use the services of professional illustrators and photographers when possible. Drawings and charts should always be done in black ink on white paper. Clear, glossy photographs, black on white, should be submitted and such illustrations numbered consecutively and their positions indicated in the text.

Magnifications will be modified in proportion to the amount of reduction necessary to fit the pages of the Journal. Please do not deface an illustration by writing on the front or the back, nor should it be taped or pasted to paper. The illustration may be pasted onto a piece of cardboard. Attached to the back of each illustration, chart or photograph should be the figure number, the author's name and the title of the article.

Legends for illustrations should be typewritten on a separate page with numbers corresponding to those on the photographs and drawings.

Recognizable photographs of patients are to be masked and should carry with them written permission for publication.

EDITORIAL RESPONSIBILITY: Manuscripts are subject to editorial modification and such revisions as are necessary to bring them into conformity with Journal style.

Statements made or opinions expressed by any contributor in any article or feature published in the Journal are the sole responsibility of the author.

PERMISSIONS: When material is reproduced from other sources, full credit must be given to both the author and publisher and written permission from these sources must be included when the material is submitted.

COPYRIGHT: Material that is published in the Maryland State Medical Journal is protected by copyright and may not be reproduced without the written permission of both the author and the Journal.

Nose clear as a whistle

(THANKS TO DIMETAPP®)

Dimetapp Extentabs® does an outstanding job of helping to clear up the stuffiness, drip and congestion of colds and upper respiratory allergies and infections. Each Extentab keeps working up to 12 hours. And for most patients drowsiness or overstimulation is unlikely. Try Dimetapp. It clearly works.

FOR UPPER RESPIRATORY ALLERGIES AND INFECTIONS

Dimetapp Extentabs®

Dimetane® (brompheniramine maleate), 12 mg.; phenylephrine HCl, 15 mg.; phenylpropanolamine HCl, 15 mg.

UP TO 12 HOURS CLEAR BREATHING ON ONE TABLET

Indications: Dimetapp is indicated for symptomatic relief of the allergic manifestations of respiratory illnesses, such as the common cold and bronchial asthma, seasonal allergies, sinusitis, rhinitis, conjunctivitis, and otitis.
Contraindications: Hypersensitivity to antihistamines. Not recommended for use during pregnancy.
Precautions: Until patient's response has been determined, he should be cautioned against engaging in operations requiring alertness. Administer with care to patients with cardiac or peripheral vascular diseases or hypertension.
Side Effects: Hypersensitivity reactions including skin rashes, urticaria, hypotension and thrombocytopenia, have been reported on rare occasions. Drowsiness, lassitude, nausea, giddiness, dryness of the mouth, mydriasis, increased irritability or excitement may be encountered.
Dosage: 1 Extentab morning and evening.
Supplied: Bottles of 100 and 500.

A.H. ROBINS COMPANY
RICHMOND, VA. 23220

A·H·ROBINS

Owner Breaks Arm When Yacht Runs Aground

Schuyler, Oct. 31. Harry Waters of Covesville incurred a fractured arm [illegible] yacht [illegible] ck a large rock tially capsized. The fire departm had to rescue Waters by small b Damage to the yacht is estimate ?.

Hasn't the skipper had enough excitement for one day?

For the patient who has been through an accident, the worry and anxiety following the mishap may actually heighten the perception of pain. This is why there's a classic ¼ grain *sedative* dose of phenobarbital in Phenaphen with Codeine—to take the nervous "edge" off, so the rest of the formula can control the pain more effectively.

A. H. Robins Company, Richmond, Va. 23220 A·H·ROBINS

Phenaphen® with Codeine

Phenaphen with Codeine Nos. 2, 3, or 4 contains: Phenobarbital (¼ gr.), 16.2 mg. (warning: may be habit forming); Aspirin (2½ gr.), 162.0 mg.; Phenacetin (3 gr.), 194.0 mg.; Hyoscyamine sulfate, 0.031 mg.; Codeine Phosphate, ¼ gr. (No. 2), ½ gr. (No. 3), or 1 gr. (No. 4) (warning: may be habit forming).

The compound analgesic that calms instead of caffeinates

Indications: Phenaphen with Codeine provides relief in severer grades of pain, on low codeine dosage, with minimal possibility of side effects. Its use frequently makes unnecessary the use of addicting narcotics. **Contraindications:** Hypersensitivity to any of the components. **Precautions:** As with all phenacetin-containing products excessive or prolonged use should be avoided. **Side effects:** Side effects are uncommon, although nausea, constipation and drowsiness may occur. **Dosage:** Phenaphen No. 2 and No. 3—1 or 2 capsules every 3 to 4 hours as needed; Phenaphen No. 4—1 capsule every 3 to 4 hours as needed. For further details see product literature.

"Current Developments in Obstetrical Anesthesia"

The film "Current Developments in Obstetrical Anesthesia"—a joint endeavor of the American Society of Anesthesiologists and The American College of Obstetricians and Gynecologists—is now available to Fellows. It has been reviewed by the Committee on Obstetric Anesthesia and Analgesia and was shown as a special film colloquium at the 1969 Annual Clinical Meeting. There is an introduction by Otto C. Phillips, MD, Pittsburgh, of the ASA and Duncan E. Reid, MD, of Boston, a Past President of the College.

This film has been divided into five segments: Epidural Anesthesia in Obstetrics, by Frederick W. Hehre, Jr., MD, Yale University; Spinal Anesthesia in Obstetrics, by Sol M. Shnider, MD, University of California Medical Center; General Anesthesia in Obstetrics, by A. H. Giesecke, Jr., MD, University of Texas, Southwestern Medical School; Fetal Scalp Blood Sampling, by Mieczyslaw Finster, MD, Columbia University Medical School; and Neonatal Resuscitation by Bradley E. Smith, University of Miami Medical School.

The entire film is available, or any of the sections may be ordered through the Ayerst film library.

To obtain a copy of the film contact Ideal Pictures (the Ayerst film distributor) at one of the following addresses:

Help the Salvation Army

count the many reasons **WHY**

the Credit Bureau is your best bet on collection problems

- Our collection department, using data processing, has the personnel and know-how to collect your past-due accounts in an ethical, efficient and effective manner.
- Over 2,000,000 reports in our files are of valuable assistance in effecting collection. Only the Credit Bureau has this advantage.
- Collections never die in the files of the Credit Bureau. Every account becomes part of a credit record for reporting to other businesses—a powerful incentive to prompt payment.
- Affiliation with 3500 other credit bureaus and collection agencies makes collections in all parts of the country fast and efficient.
- Our service costs you not one penny if no money is collected from your patient. Checks, minus commissions, are mailed to you monthly.

THE COMMITTEE ON CONTINUING MEDICAL EDUCATION

of the

UNIVERSITY OF MARYLAND SCHOOL OF MEDICINE

offers a

VISITING TRAINEESHIP IN-SERVICE PROGRAM

(1 TO 4 WEEKS)

Various departments and sub-divisions of the University of Maryland School of Medicine are open to interested physicians through a "Visiting Traineeship In-Service Program" designed to expose the practicing physician to the most current concepts in the practice of medicine, surgery and their various specialties.

This program is highly flexible and designed for each enrollee individually. The enrolled physician will participate in the department's routine scheduled program of Rounds, Clinics and Conferences. No alteration in the departmental routine will be made to formalize the program into a specific postgraduate course. The enrollee will, however, be the guest of the division or department with which he affiliates. Ample allowance of time will be made for collateral reading in the privacy of the library and for attendance at Chief of Service Rounds, Resident Rounds and Grand Rounds, if desired.

Each program is individually designed where possible. Such programs are formulated after a personal interview with the Director, or Assistant Director, of the Committee on Continuing Medical Education, and the Department or Division Head under whose supervision the trainee or enrollee will work. However, if a personal interview is inconvenient because of geographical distance, applications will be considered by appropriate correspondence.

Minimum enrollment is one week (5 days). Longer periods may be arranged with the approval of the Chairman of the Committee on Continuing Medical Education and the Head of the department or division involved.

The Visiting Traineeship In-Service Program allows for cross-disciplinary visiting, or the entire period may be allocated to one specific subject or medical problem. This program, therefore, offers a variety of possibilities that may allow a profitable and rewarding experience.

This program of training is not available during June, July, August and September.

M.D.'S NEEDED IN MEDICAL RESEARCH

Satisfaction is relative

We believe that many physicians would find A. H. Robins a satisfying place to work, and Richmond, Virginia a satisfying place to live.

Work: Qualified M.D.'s would be responsible for establishing and maintaining suitable liaison with potential and current clinical investigators of new drugs developed in the A. H. Robins research laboratories. Freedom and willingness to travel up to 25% of time essential.

Live: City, suburban or country living is no more than 15 minutes from our offices. Outstanding universities including a major hospital-medical school complex. Richmond offers excellent cultural and recreational activities. Only 90 minutes to the Blue Ridge mountains or seashore.

We would like to talk to physicians currently engaged in research or in practice, who may have a serious interest in exploring these opportunities. Please forward curriculum vitae in complete confidence to:

When disease is ruled out and psychic tension is implicated

Valium® (diazepam) helps relax the patient and relieve his somatic symptoms

Before prescribing, please consult complete product information, a summary of which follows:

Indications: Tension and anxiety states; somatic complaints which are concomitants of emotional factors; psychoneurotic states manifested by tension, anxiety, apprehension, fatigue, depressive symptoms or agitation; acute agitation, tremor, delirium tremens and hallucinosis due to acute alcohol withdrawal; adjunctively in skeletal muscle spasm due to reflex spasm to local pathology, spasticity caused by upper motor neuron disorders, athetosis, stiff-man syndrome, convulsive disorders (not for sole therapy).

Contraindicated: Known hypersensitivity to the drug. Children under 6 months of age. Acute narrow angle glaucoma.

Warnings: Not of value in psychotic patients. Caution against hazardous occupations requiring complete mental alertness. When used adjunctively in convulsive disorders, possibility of increase in frequency and/or severity of grand mal seizures may require increased dosage of standard anticonvulsant medication; abrupt withdrawal may be associated with temporary increase in frequency and/or severity of seizures. Advise against simultaneous ingestion of alcohol and other CNS depressants. Withdrawal symptoms have occurred following abrupt discontinuance. Keep addiction-prone individuals under careful surveillance because of their predisposition to habituation and dependence. In pregnancy, lactation or women of childbearing age, weigh potential benefit against possible hazard.

Precautions: If combined with other psychotropics or anticonvulsants, consider carefully pharmacology of agents employed. Usual precautions indicated in patients severely depressed, or with latent depression, or with suicidal tendencies. Observe usual precautions in impaired renal or hepatic function. Limit dosage to smallest effective amount in elderly and debilitated to preclude ataxia or oversedation.

Side Effects: Drowsiness, confusion, diplopia, hypotension, changes in libido, nausea, fatigue, depression, dysarthria, jaundice, skin rash, ataxia, constipation, headache, incontinence, changes in salivation, slurred speech, tremor, vertigo, urinary retention, blurred vision. Paradoxical reactions such as acute hyperexcited states, anxiety, hallucinations, increased muscle spasticity, insomnia, rage, sleep disturbances, stimulation, have been reported; should these occur, discontinue drug. Isolated reports of neutropenia, jaundice; periodic blood counts and liver function tests advisable during long-term therapy.
